"All our energies were now directed to getting our animals across the snow ; and it was supposed that, after all the baggage had been drawn with the sleighs over the trail we had made, it would be sufficiently hard to bear our animals. At several places between this point and the ridge, we had discovered some grassy spots, where the wind and sun had dispersed the snow from the sides of the hills, and these were to form resting-places to support the animals for a night in their passage across. On our way across we had set on fire several broken stumps and dried trees, to melt holes in the snow for the camps. Its general depth was five feet, but we passed over places where it was twenty feet deep.

"With one party drawing sleighs loaded with baggage, I advanced to-day about four miles along the trail, and encamped at the first grassy spot, where we expected to bring our horses. Another party remained behind, to form an intermediate station between us and the animals.

"*February 8.*—The night has been extremely cold ; but perfectly still, and beautifully clear. Before the sun appeared this morning the thermometer was 3 deg. below zero, 1 deg. higher when his rays struck the lofty peaks.

"Scenery and weather combined must render these mountains beautiful in summer ; the purity and deep-blue colour of the sky are singularly beautiful ; the days are sunny and bright, and even warm in the noon hours ; and if we could be free from the many anxieties that oppress us, even now we would be delighted here ; but our provisions are getting fearfully scant. Sleighs arrived with the baggage about ten o'clock ; and leaving a portion of it here we continued on for a mile and a half, and encamped at the foot of a long hill on this side of the open bottom. Elevation of the camp, 7920 feet.

"*February 9.*—During the night the weather changed, the wind rising to a gale, and commencing to snow before daylight : before morning the trail was covered. We remained quiet in camp all day. We suffer much from the want of salt ; and all the men are becoming weak from insufficient food.

"*February 10.*—Taplin was sent back with a few men to assist Mr. Fitzpatrick ; and continuing on with three sleighs carrying a part of the baggage, we had the satisfaction to encamp within two and a half miles of the head of the hollow, and at the foot of the last mountain ridge. Here two large trees had been set on fire, and in the holes where the snow had been melted away, we

found a comfortable camp. The wind kept the air filled with snow; the sky was very dark in the south-west, though elsewhere very clear. The forest here has a noble appearance; the tall cedar is abundant; its greatest height being 130 feet, and circumference twenty, three or four feet above the ground; and here I see for the first time the white pine, of which there are some magnificent trees. Hemlock spruce is among the timber, occasionally as large as eight feet in diameter four feet above the ground; but in ascending it tapers rapidly to less than one foot at the height of eighty feet. I have not seen any higher than 130 feet, and the slight upper part is frequently broken off by the wind. The white spruce is frequent, and the red pine, (*pinus colorado* of the Mexicans,) which constitutes the beautiful forest along the flanks of the Sierra Nevada to the northward, is here the principal tree, not attaining a greater height than 140 feet, though with sometimes a diameter of ten. The elevation of the camp, 8050 feet, 1000 feet above the level of the South Pass of the Rocky Mountains.

"Putting on our snow-shoes, we spent the afternoon in exploring a road ahead. The glare of the snow, combined with great fatigue, had rendered many of the people nearly blind; but we were fortunate in having some black silk handkerchiefs, which, worn as veils, very much relieved the eye.

"*February 11.*—High wind continued, and our trail this morning was nearly invisible, here and there indicated by a little ridge of snow. Our situation became tiresome and dreary, requiring patience and resolution.

"In the evening I received a message from Mr. Fitzpatrick, acquainting me with the utter failure of his attempt to get our mules and horses over the snow; the half-hidden trail had proved entirely too slight to support them, and they had broken through, and were plunging about or lying half buried in snow. I wrote to him to send the animals immediately back to their old pastures, and, after having made mauls and shovels, turn in all the strength of his party to open and beat a road through the snow, strengthening it with pine branches and boughs.

"*February 12.*—We made mauls, and worked hard at our end of the road all the day. The wind was high, but the sun bright, and the snow thawing. We worked down the face of the hill, to meet the people at the other end. Towards sundown it began to grow cold, and we shouldered our mauls and trudged back to camp. Next day continued to labour in opening the road; and supped at night on pea-soup, mule, and dog."

On the night of February 14th, Captain Fremont ascended the highest peak to the right, from which he had a view of a mountain lake, about fifteen miles in length, and so entirely surrounded by mountains that he could not discover an outlet. "Snow could be distinguished on the higher parts of the coast mountains; eastward, as far as the eye could extend, it ranged over a *terrible* mass of broken snowy mountains. The rock composing the summit consists of a very coarse, dark, volcanic conglomerate; the lower parts appeared to be of a

slaty structure. The highest trees were a few scattering cedars and aspens. From the immediate foot of the peak we were two hours in reaching the summit, and one hour and a quarter in descending. The day had been very bright, still, and clear, and spring seems to be advancing rapidly. While the sun is in the sky the snow melts rapidly, and gushing springs cover the face of the mountain in all the exposed places, but their surface freezes instantly with the disappearance of the sun. Obtained to-night some observations; the result gave for the latitude 38 deg. 41 min. 57 sec., longitude 120 deg. 25 min. 57 sec."

February 16, 17, and 18.—Exploring the way in order to bring the mules and effects forward, they travelled along the crests of narrow ridges, extending down from the mountain in the direction of the valley.

"*February 20.*—After enduring almost incredible hardships we encamped with the animals, and all the *materiel* of the camp, on the summit of the Pass in the dividing ridge, 1000 miles, by our travelled road, from the Dalles of the Columbia. The temperature of boiling water gave for the elevation of the encampment 9338 feet above the sea, 2000 feet higher than the South Pass in the Rocky Mountains; and several peaks in view rose several thousand feet still higher. Thus, at the extremity of the continent, and near the coast, the phenomenon was seen of a range of mountains still higher than the great Rocky Mountains. This extraordinary fact accounts for the Great Basin, and shows that there must be a system of small lakes and rivers here scattered over a flat country, and which the extended and lofty range of the Sierra Nevada prevents from escaping to the Pacific Ocean. Latitude 38 deg. 44 min.; longitude 120 deg. 28 min.

This Pass in the Sierra Nevada, which well deserves its name of Snowy Mountain, is eleven degrees west and about four degrees south of the South Pass.

Before them there were now the difficulties of deep fields of snow and a large intervening space of rough-looking mountains, through which they had yet to wind their way to the valley beneath. They started next morning long before daybreak, in order to pass the snow-fields before the sun melted the frozen crust. The scene at sunrise was unusually glorious and beautiful. "Immediately above the eastern mountains was repeated a cloud-formed mass of purple ranges, bordered with bright yellow gold; the peaks shot up into a narrow line of crimson cloud, above which the air was filled with a greenish orange; and over all was the singular beauty of the blue sky. Passing along a ridge which commanded a lake on our right, of which we began to discover an outlet through a chasm on the west, we passed over alternating open ground, and hard crusted snow-fields which supported the animals, and encamped on the ridge, after a journey of six miles. The grass was better than we had yet seen, and we were encamped in a clump of trees twenty or thirty feet high, resembling white pine. With the exception of these small clumps, the ridges were bare; and, where the snow found the support of the trees, the wind had blown it up into banks ten or fifteen feet high. It required much care to hunt out a practicable way, as the most open places frequently led to impassable banks.

"Ascending a height, we traced out the best line we could discover for the next day's march, and had at least the consolation to see that the mountain descended rapidly. The day had been gusty, with a few occasional flakes of snow; which, in the afternoon, enveloped the upper mountain in clouds. Shortly after we heard the roll of thunder, and, looking towards the valley, found it all enveloped in a thunder-storm. When the sky cleared off brightly and we saw a shining line of water directing its course towards another, a broader and larger sheet: these could be no other than the Sacramento and the Bay of San Francisco.

"*February 22.*—We took advantage of the coolness of the early morning to get over the snow, which occurred in very deep banks among the timber, and the animals passed successfully with their loads the hard crust. Now and then, the delay of making a road occasioned much labour and loss of time. In the after-part of the day we saw before us a handsome grassy ridge point; and, making a desperate push over a snow-field ten to fifteen feet deep, we happily succeeded in getting the camp across; and encamped on the ridge after a march of three miles. We had again the prospect of a thunder-storm below, and to-night we killed another mule—now our only resource from starvation. We satisfied ourselves during the day that the lake had an outlet between two ranges on the right; and with this the creek on which I had encamped probably effected a junction below. Between these we were descending.

"The elevation above the sea, by the boiling point, is 8565 feet."

February 24.—By an astronomical observation latitude 38 deg. 46 min. 58 sec.; longitude 120 deg. 34 min. 20 sec.

Green grass began to make its appearance. The character of the forest continued the same. The flood of the river was a roaring torrent, its fall very great; and descending with furious rapidity. Oaks appeared on the ridge, and soon became frequent; with unusually great quantities of misletoe. Rushes began to make their appearance.

At one of these rivulets, some beautiful evergreen trees, resembling live oak, were forty to fifty feet high and two in diameter, with a tufted top; and a summer green of beautiful foliage. The singing birds cheered the woods, and the soft summer wind was whirling about the dry oak leaves. The party hurried onwards, "filled with excitement, to escape from the horrid region of inhospitable snow to the perpetual spring of the Sacramento." Along the road the rock there appeared a white granite, which seemed to constitute the upper part of the mountains on both the eastern and western slopes: between the central prevail volcanic rocks; a horse was killed at night for food.

The river flowed in a direct westerly course through a narrow valley, with a very slight and narrow bottom land. The party travelled down twelve miles, and encamped at some old Indian huts: apparently a fishing-place on the river. The bottom was covered with deciduous trees, vines, and rushes.

The forest abounded with magnificent trees; some of the pines bearing large cones, were ten feet in diameter; cedars also abounded. One measured twenty-eight feet and a half in circumference, four feet from the ground. These trees were found on both sides of the Sierra, but most abundant on the west.

On the 26th of February they continued to follow the descending stream: the mountains on each side increasing in height, and shutting up the river between narrow precipices, along which they had great difficulty to get on with the horses.

It rained heavily during the afternoon, and they were forced off the river to the heights above; from whence they descended, at nightfall, between the river and a fork of nearly equal size coming in from the right. Here appeared, on the lower hills, the first flowers in bloom, one of them a species of *gilia*.

The current in both rivers, or rather torrents, was broken by large boulders. It was late, the animals fatigued; and where the party encamped, the hill side afforded but a few stray bunches of grass, and the horses, standing in the rain, looked miserable.

On the following morning they succeeded in fording the stream, about sixty feet wide, but rapid, and occasionally deep, foaming among boulders, and the water beautifully clear. A mule being killed here, the head was boiled in a large kettle for several hours, and made a "passable soup for famished people."

Next day precipices on the river forced them to the heights, which were ascended by a steep spur 2000 feet high. They saw a deer, but did not succeed in killing him. As the day advanced no grass appeared, and the lives of our horses depended on food for the night. They were in such a condition that only grass and repose for the night enabled them to travel the next day. A new shrub, which had made its appearance since crossing the mountain, became frequent. "It branched out near the ground, forming a clump eight to ten feet high, with pale green leaves of an oval form, and the body and branches had a naked appearance as if stripped of the bark, which is very smooth and thin, of a chocolate colour, contrasting well with the pale green of the leaves."

Near nightfall they descended into the steep ravine of a creek and when Captain Fremont was engaged in getting the horses up the opposite hill, he heard a shout from Carson, who had gone a-head a few hundred yards—"Life yet," said he as he came up, "life yet; I have found a hill-side sprinkled with grass." They drove along the horses, and encamped about dark, where there was just room enough, near a grassy hill, on the edge of the stream. Three horses were lost this day.

"*March 1.*—Continued on over the uplands, crossing many small streams, and camped again on the river, having made six miles. Here we found the hill-side covered (although lightly) with fresh green grass; and from this time forward we found it always improving and abundant. There were some beautiful specimens of the chocolate-coloured shrub, which were a foot in diameter near the ground, and fifteen to twenty feet high. We are rapidly descending into the spring, and we are leaving our snowy region far behind; every thing is getting green; butterflies

are swarming; numerous bugs are creeping out, wakened from their winter's sleep; and the forest flowers are coming into bloom. Among those which appeared most numerous to-day was *dodecatheon dentatum*."

The condition of the party may be judged, when some wandered away from the camp in a state of mental derangement, plunged into the torrents, or wandered into the forest, and Captain Fremont well remarks, "The times were severe when stout men lost their minds from extremity of suffering—when horses died—and when mules and horses, ready to die of starvation, were killed for food.

"*March 3.*—The daily journeys were necessarily short, but at every step the country improved in beauty; the pines were rapidly disappearing, and oaks became the principal trees of the forest. Among these, the prevailing tree was the ever-green oak (which, by way of distinction, we shall call the *live oak*); and with these occurred frequently a new species of oak bearing a long slender acorn, from an inch to an inch and a half in length, which was afterwards found to constitute a principal vegetable food of the inhabitants of this region.

"*March 4.*—We continued rapidly along on a broad, plainly-beaten trail. Our road led along a ridge inclining to the river, and the air, and the open grounds were fragrant with flowering shrubs; and in the course of the morning we issued on an open spur, by which we descended directly to the stream. Here the river issues suddenly from the mountains, which hitherto had hemmed it closely in; these now become softer, and change sensibly their character; and at this point commences the most beautiful valley in which we had ever travelled. The river grounds were undulating, and covered with grass to the river brink. We ascended to the uplands, where the river passes round a point of great beauty, and goes through very remarkable dalles, in character resembling those of the Columbia River.

"Continuing the next day down the river, we discovered three squaws in a little bottom, and surrounded them before they could make their escape. They had large conical baskets, which they were engaged in filling with a small leafy plant (*erodium cicutarium*) just now beginning to bloom, and covering the ground like a sward of grass. They offered us smaller baskets of the plant, which they signified to us was good to eat, making signs also that it was to be cooked by the fire. We drew out a little cold horse-meat, and the squaws made signs to us that the men had gone out after deer, and that we could have some by waiting till they came in. The horses eat with great avidity the herb which they had been gathering: and here, also, for the first time, we saw Indians eat the common grass—one of the squaws pulling several tufts, and eating it with apparent relish. Seeing our surprise, she pointed to the horses; but we could not well understand what she meant, except, perhaps, that what was good for the one was good for the other.

"We encamped in the evening on the undulating river shore, shaded with the live oaks, which formed a continuous grove over the country, and the same grassy

sward extended to the edge of the water; we made our fires near some large granite masses which were lying among the trees. Saw acorn *caches* during the day; two of which were very large, containing each, probably, ten bushels.

"*March 6.*—We continued on our road through the same surpassingly beautiful country, entirely unequalled for the pasturage of stock by any thing we had ever seen. Our horses had now become so strong that they were able to carry us, and we travelled rapidly, over four miles an hour; four of us riding every alternate hour. Every few hundred yards we came upon a little band of deer; but we were too eager to reach the settlement, which we momentarily expected to discover, to halt for any other than a passing shot. In a few hours we reached a large fork, the northern branch of the river, and equal in size to that which we had descended. Together they formed a beautiful stream, sixty to one hundred yards wide; which at first, ignorant of the nature of the country through which that river ran, we took to be the Sacramento.

"We continued down the right bank of the river, travelling for a while over a wooded upland, where we had the delight to discover the tracks of cattle. To the south-west was visible a black column of smoke, which we had frequently noticed in descending, arising from the fires we had seen from the top of the Sierra. From the upland we descended into broad groves on the river, consisting of the ever-green, and a new species of white oak with a large tufted top, and three to six feet in diameter. Among these was no brushwood, and the grassy surface gave to it the appearance of parks in an old settled country. Following the tracks of the horses and cattle in search of people we discovered a small village of Indians. Some of these had on shirts of civilised manufacture, but were otherwise naked, and we could understand nothing from them."

The party, after an acorn meal, hurried on down a valley gay with flowers, and the banks absolutely golden with the Californian poppy (*eschscholtzia crocea*). The grass was smooth and green, the groves open, the large oaks throwing a broad shade over sunny spots. They came to a neatly built *adobe* house with glass windows, but found only Indians. They then followed the river which swept in a large bend to the right; and as the hills diverged they entered a broad valley, and arrived at a large Indian village, where the people looked clean, and wore cotton shirts and various other articles of dress. One spoke a little indifferent Spanish; a well-dressed Indian then came up, and made salutations in good Spanish. He informed them that they were upon the *Rio de los Americanos* (the river of the Americans), and that it flowed into the Sacramento River about ten miles below. He was a *vaquero* (cow herd) in the service of Captain Suter, and the people of this *rancheria* worked for him. Soon after they came in sight of Captain Suter's fort: passing on the way the house of an American settler named Sinclair. They then forded the river, and met Captain Suter, who gave them a cordial reception, and were hospitably lodged in his fort: the account of which by Captain Fremont is already introduced under the head of California.

After remaining until the 22nd of March at New Helvetia and its neighbourhood, Captain Fremont started on the homeward route to the United States. Having made a preparatory movement, he resumed his journey on the 24th of March, with an ample stock of provisions and a large cavalcade of animals, consisting of 130 horses and mules, and about thirty head of cattle, five of which were milch cows. Mr. Suter furnished them also with an Indian boy, who had been trained as a *vaquero*, and who would be serviceable in managing the cavalcade, great part of which were nearly as wild as buffalo. The direct course for the United States was east; but the Sierra forced them south, above 500 miles of travelling, to a pass at the head of the San Joaquin River. This pass, reported to be good, was discovered by Mr. Joseph Walker, a celebrated trapper.

"To reach it," says Captain Fremont, "our course lay along the valley of the San Joaquin, the river on our right, and the lofty wall of the impassable Sierra on the left. From that pass we were to move south-eastwardly, having the Sierra then on the right, and reach the '*Spanish trail*,' deviously traced from one watering-place to another, which constituted the route of the caravans from *Puebla de los Angeles*, near the coast of the Pacific, to *Santa Fé* of New Mexico. From the pass to this trail was 150 miles. Following that trail through a desert, relieved by some fertile plains, indicated by the recurrence of the term *vegas*, until it turned to the right to cross the Colorado, our course would be north-east until we regained the latitude we had lost in arriving at the Utah Lake, and thence to the Rocky Mountains at the head of the Arkansas. This course of travelling, forced upon us by the structure of the country, would occupy a computed distance of 2000 miles before we reached the head of the Arkansas; not a settlement to be seen upon it; and the names of places along it all being Spanish or Indian."

The party travelled the next day about eighteen miles, and encamped on the *Rio de los Cosumnes*, a stream receiving its name from the Indians who live in its valley. The route was through a level country, admirably suited to cultivation, and covered with groves of oak-trees, principally the evergreen-oak, and a large oak in form like those of the white oak. The weather, which here, at this season, can easily be changed from the summer heat of the valley to the frosty mornings and bright days nearer the mountains, continued delightful for travellers, but unfavourable to the agriculturists, whose crops of wheat began to wear a yellow tinge from want of rain.

On the 25th of March, they travelled for twenty-eight miles over the same delightful country as before, and halted in a beautiful bottom at the ford of the *Rio de los Muhelemnes*, receiving its name from another Indian tribe living on the river. "The bottoms on the stream are broad, rich, and extremely fertile; and the uplands are shaded with oak-groves. A showy *lupinus*, of extraordinary beauty, growing four to five feet in height, and covered with spikes, in bloom, adorned the banks of the river, and filled the air with a perfume."

On the 26th, they halted at the *Arroyo de las Calaveras*, a tributary to the San Joaquin—the previous two streams entering the bay between the San Joaquin and Sacramento Rivers. This place was beautiful, with open groves of oak, and a grassy sward beneath, with many plants in bloom. Near the river, and replacing the grass, were great quantities of *ammole* (soap plant), the leaves of which are used in California for making, among other things, mats for saddle-cloths. A vine with a small white flower (*melothria*?) called *la yerba buena*, and which, from its abundance, gives name to an island and town in the bay, was very frequent on the road—sometimes running on the ground or climbing the trees.

On the following day they travelled rapidly up the valley; making about five miles an hour. During the earlier part of the day the ride had been over a very level prairie, or rather a succession of long stretches of prairie, separated by lines and groves of oak-timber, growing along dry gulleys, which are filled with water in seasons of rain; and by the melting snows. Over much of this extent, the vegetation was spare; the surface showing the action of water, which, in the season of flood, the Joaquin spreads over the valley. About one o'clock they came again among innumerable flowers; and few miles further, fields of the beautiful blue-flowering *lupine*, which thrives in the neighbourhood of water, indicated that they were approaching a stream. They here found this beautiful shrub growing in thickets, some being twelve feet in height. Occasionally three or four plants were clustered together, forming a grand bouquet, about ninety feet in circumference, and ten feet high; the whole summit covered with flowers. They continued their road for about half a mile, through an open grove of live oaks, which, in form, were the most symmetrical and beautiful they had yet seen in this country. The ends of their branches rested on the ground, forming somewhat more than a half sphere of very full and regular figure, with leaves apparently smaller than usual. The Californian poppy, of a rich orange colour, was also abundant. Elk and several bands of antelope made their appearance.

The route was delightful, amidst green pastures, flowers and scattered groves, and in the warm spring weather, the view of the rocky and snowy peaks among which they had lately endured fatigue, privation, and severe cold.

"Emerging from the timber," says Captain Fremont, "we came suddenly upon the *Stanislaus River*, where we hoped to find a ford, but the stream was flowing by, dark and deep, swollen by the mountain snows; its general breadth was about fifty yards. We travelled about five miles up the river, and encamped without being able to find a ford. Here we made a large *corál*, in order to be able to catch a sufficient number of our wild animals to relieve those previously packed.

"Under the shade of the oaks along the river, I noticed *erodium circutarium* in bloom, eight or ten inches high. This is the plant which we had seen the

squaws gathering on the Rio de los Americanos. By the inhabitants of the valley it is highly esteemed for fattening cattle, which appear to be very fond of it. Here, where the soil begins to be sandy, it supplies to a considerable extent the want of grass.

"Desirous, as far as possible, without delay, to include in our examination the San Joaquin River, I returned this morning down the Stanislaus for seventeen miles, and again encamped without having found a fording-place. After following it for eight miles further the next morning, and finding ourselves in the vicinity of San Joaquin, encamped in an oak grove, and, several cattle being killed, we ferried over our baggage in their skins. Here our Indian boy, who probably had no idea of where he was going, began to be alarmed at the many streams which we were rapidly putting between him and the village, deserted.

"Thirteen head of cattle took a sudden fright, while we were driving them across the river, and galloped off. I remained a day in the endeavour to recover them; but, finding they had taken the trail back to the fort, let them go without further effort. Here we had several days of warm and pleasant rain, which doubtless saved the crops below.

"On the 1st of April, we made ten miles across a prairie without timber, when we were stopped again by another large river, which is called the *Rio de la Merced* (River of our Lady of Mercy). Here the country had lost its character of extreme fertility, the soil having become sandy and light; but for several days past, its beauty had been increased by the additional animation of animal life; and now, it is crowded with bands of elk and wild horses; and along the rivers are frequent fresh tracks of the grizzly bear, which are unusually numerous in this country. Our route had been along the timber of the San Joaquin, generally about eight miles distant, over a high prairie.

"In one of the bands of elk seen to-day, there were about 200; but the larger bands, both of these and wild horses, are generally found on the other side of the river, which, for that reason, I avoided crossing. I had been informed below, that the droves of wild horses were almost invariably found on the western bank of the river; and the danger of losing our animals among them, together with the wish of adding to our reconnoissance the numerous streams which run down from the Sierra, decided me to travel up the eastern bank.

"The next day was occupied in building a boat, and ferrying our baggage across the river; and we encamped on the bank. A large fishing eagle, with white head and tail, was slowly sailing along, looking after salmon; and there were some pretty birds in the timber, with partridges, ducks, and geese innumerable in the neighbourhood.

"On the 3rd of April we touched several times the San Joaquin River—here a fine-looking tranquil stream, with a slight current, and apparently deep. It

resembled the Missouri in colour, with occasional points of white sand, and its banks, where steep, were a kind of sandy clay; its average width appeared to be about eighty yards. In the bottoms are frequent ponds, where our approach disturbed multitudes of wild-fowl, principally geese. Skirting along the timber, we frequently started elk; and large bands were seen during the day, with antelopes and wild horses. The low country and the timber rendered it difficult to keep the main line of the river; and this evening we encamped on a tributary stream, about five miles from its mouth. On the prairie bordering the San Joaquin bottoms, there occurred during the day but little grass, and in its place was a sparse and dwarf growth of plants. The soil being sandy, with small bare places and hillock, reminded me much of the Platte bottoms; but, on approaching the timber, we found a more luxuriant vegetation; and at our camp was an abundance of grass and pea-vines. The foliage of the oak is getting darker."

On the 4th of April they crossed the river without any difficulty, and travelled up along its banks. Elk were running in bands over the prairie and in the skirt of the wood. Here the country becomes very flat; oak trees entirely disappeared, and were replaced by willows nearly equal in size to the oaks. The river was about 100 yards in breadth, branching into sloughs, and interspersed with islands. It appeared sufficiently deep for a small steamer, but its navigation would be interrupted by shallows at low water. The prairies along the left bank were covered with droves of wild horses. Latitude of encampment, by observation, 37 deg. 08 min.; longitude, 120 deg. 45 min. 22 sec.

As they travelled onward on the following day, "the country presented a lacustrine appearance; the river was deep, and nearly on a level with the surrounding country; its banks raised like a levee, and fringed with willows. Over the bordering plain were interspersed spots of prairie among fields of *tulé* (bulrushes), which in this country are called *tulares*, and little ponds. On the opposite side, a line of timber was visible, which, according to information, points out the course of the slough, which at times of high water connects with the San Joaquin River a large body of water in the upper part of the valley, called the Tulé Lakes. Here elk were frequently started, and one was shot. On our left, the Sierra maintains its snowy height, and masses of snow appear to descend very low towards the plains; probably the late rains in the valley were snow on the mountains. We travelled thirty-seven miles, and encamped on the river.

"April 6.—After having travelled fifteen miles along the river, we made an early halt under the shade of sycamore trees. Here we found the Jan Joaquin coming down from the Sierra with a westerly course, and checking our way, as all its tributaries had previously done. We had expected to raft the river, but found a good ford, and encamped on the opposite bank, where droves of wild horses were raising clouds of dust on the prairie. Columns of smoke were visible in the direction of the Tulé Lakes to the southward—probably kindled in the *tulares* by the Indians, as signals that there were strangers in the valley.

"We made on the 7th a hard march in a cold chilly rain from morning until night—the weather so thick that we travelled by compass. This was a *traverse* from the Joaquin to the waters of the Tulé Lakes, and our road was over a very level prairie country. We saw wolves frequently during the day, prowling about after the young antelope, which cannot run very fast. These were numerous during the day, and two were caught by the people.

"Late in the afternoon we discovered timber, which was found to be groves of oak trees on a dry *arroyo*. The rain which had fallen in frequent showers, poured down in a storm at sunset, with a strong wind, which swept off the clouds, and left a clear sky.

"April 8.—We reached a large stream, called the River of the Lake, resembling in size the San Joaquin, and being about 100 yards broad. This is the principal tributary to the Tulé Lakes, which collect all the waters in the upper part of the valley.

"The Indians of the Sierra make frequent descents upon the settlements west of the Coast Range, which they keep constantly swept of horses; among them are many who are called Christian Indians, being refugees from Spanish missions. Occasionally parties of soldiers follow them across the Coast Range, but never enter the Sierra.

"On the opposite side we found some forty or fifty Indians who had come to meet us from the village below. We made them some small presents, and invited them to accompany us to our encampment, which, after about three miles ride through fine oak groves, we made on the river. We made a fort, principally on account of our animals. The Indians brought otter-skins, and several kinds of fish, and bread made of acorns, to trade. Among them were several who had come to live among these Indians when the missions were broken up, and who spoke Spanish fluently. They informed us that they were called by the Spaniards *mansitos* (tame), in distinction from the wilder tribes of the mountains. They, however, think themselves very insecure, not knowing at what unforeseen moment the sins of the latter may be visited on them. They are dark-skinned, but handsome and intelligent Indians, and live principally on acorns and the roots of the *tulé*, of which also their huts are made. By observation, the latitude of the encampment is 36 deg. 24 min. 50 sec., and longitude 119 deg. 41 min. 40 sec."

The expedition travelled onwards, over a country in some parts rough, in others wooded, and in many parts barren, until the 13th of April, when they approached the mountains. They ascended by a trail for a few miles along the bed of a creek without water, and suddenly came to a stream running with a lively current, but losing itself almost immediately in the sand. In a similar manner the mountain-waters lose themselves in sand at the eastern foot of the Sierra, leaving only a parched desert and arid plains beyond. The stream enlarged as they ascended. A new species of pine, several kinds of oaks, and a variety of trees, became abun-

dant, and the party found themselves again travelling among the old orchard-like places. Here they selected a delightful encampment in a handsome green oak hollow, where, among the open bolls of the trees, was an abundant sward of grass and pea-vines. In the evening a Christian Indian rode into the camp, well dressed, with long spurs and a *sombrero*, and speaking Spanish fluently: it was an unexpected apparition, and a strange and pleasant sight in this desolate gorge of a mountain—an Indian face, Spanish costume, jingling spurs, and horse equipped after the Spanish manner. He belonged to one of the Spanish missions to the south, distant two or three days' ride, and had obtained from the priests leave to spend a few days with his relations in the Sierra. He appeared familiarly acquainted with the country. The interior of the Great Basin, pursuing a direct course for the frontier, he represented as "an arid and barren desert that had repulsed by its sterility all the attempts of the Indians to penetrate it." This information induced Captain Fremont to relinquish the plan which he had previously formed for crossing this dreaded region. Latitude of the camp, 35 deg. 17 min. 12 sec., and longitude 118 deg. 35 min. 03 sec.

The expedition then travelled onward towards the Sierra up a valley, enriched by a profusion of flowers, sycamore, oaks, cotton-wood, and willow, with other trees, and shrubby plants. The cotton-wood varied its foliage with white tufts. Gooseberries, nearly ripe, were very abundant on the mountain slopes. On passing the dividing grounds, which were not very easy to ascertain, the air was filled with perfume, as if they were entering a highly cultivated garden; and, instead of green, the pathway and the mountain sides were covered with fields of yellow flowers, which was the prevailing colour. The journey was in the midst of an advanced spring, whose green and floral beauty offered a delightful contrast to the sandy valley they had just left. All the day snow was in sight on the butt of the mountain, which frowned down on the right as they rode along between green trees, and on flowers, with humming-birds and other feathered friends of the traveller enlivening the serene spring air.

"As we reached," says Captain Fremont, "the summit of this beautiful pass, and obtained a view into the eastern country, we saw at once that here was the place to take leave of all such pleasant scenes as those around us. The distant mountains were now bald rocks again; and below, the land had any colour but green. Taking into consideration the nature of the Sierra Nevada, we found this pass an excellent one for horses; and with a little labour, or perhaps with a more perfect examination of the localities, it might be made sufficiently practicable for waggons. Its latitude and longitude may be considered that of our last encampment, only a few miles distant. The elevation was not taken—our half-wild cavalcade making it too troublesome to halt before night, when once started.

“We here left the waters of the bay of San Francisco; though forced upon them contrary to my intentions, I cannot regret the necessity which occasioned the deviation. It made me well acquainted with the great range of the Sierra Nevada of the *Alta California*, and showed that this broad and elevated snowy ridge was a continuation of the Cascade Range of Oregon, between which and the ocean there is still another and a lower range, parallel to the former and to the coast, and which may be called the Coast Range. It also made me well acquainted with the basin of the San Francisco bay, and with the two pretty rivers and their valleys (the Sacramento and the San Joaquin), which are tributary to that bay; and cleared up some points in geography on which error had long prevailed. It had been constantly represented, as I have already stated, that the bay of San Francisco opened far into the interior, by some river coming down from the base of the Rocky Mountains, and upon which supposed stream the name of Rio Buenaventura had been bestowed. Our observations of the Sierra Nevada, in the long distance from the head of the Sacramento, to the head of the San Joaquin, and of the valley below it, which collects all the waters of the San Francisco bay, show that this neither is nor can be the case. No river from the interior does or can cross the Sierra Nevada—itself more lofty than the Rocky Mountains; and as to the Buenaventura, the mouth of which, seen on the coast, gave the idea and the name of the reputed great river, it is, in fact, a small stream of no consequence, not only below the Sierra Nevada, but actually below the Coast Range—taking its rise within half a degree of the ocean, running parallel to it for about two degrees, and then falling into the Pacific near Monterey. There is no opening from the bay of San Francisco into the interior of the continent. The two rivers which flow into it are comparatively short, and not perpendicular to the coast, but lateral to it, and having their heads towards Oregon and Southern California. They open lines of communication north and south, and not eastwardly; and thus this want of interior communication from the San Francisco bay, now fully ascertained, gives great additional value to the *Columbia*, which stands alone as the only great river on the Pacific slope of our continent, which leads from the ocean to the Rocky Mountains, and opens a line of communication from the sea to the valley of the Mississippi.

“Four *companeros* joined our guide at the pass; and two going back at noon, the others continued on in company. Descending from the hills, we reached a country of fine grass, where the *erodium cicutarium* finally disappeared, giving place to an excellent quality of bunch grass. Passing by some springs where there was a rich sward of grass among groves of large black oak, we rode over a plain on which the guide pointed out a spot where a refugee Christian Indian had been killed by a party of soldiers which had unexpectedly penetrated into the mountains. Crossing a low sierra, and descending a hollow where a

spring gushed out, we were struck by the sudden appearance of *yucca* trees, which gave a strange and southern character to the country, and suited well with the dry and desert region we were approaching."

Next day the party continued a short distance down a creek, in which the guide informed them that the water very soon disappeared, and descended to a kind of plain among the lower spurs; the desert being in full view to the left, apparently illimitable.

Captain Fremont describes the scene as indeed dismal to look upon, and it was hard to conceive so great a change in so short a distance. "One might travel the world over without finding a valley more fresh and verdant—more floral and sylvan—more alive with birds and animals—more bounteously watered—than we had left in the San Joaquin; here, within a few miles' ride, a vast desert plain spread before us, from which the boldest traveller turned away in despair.

"Directly in front of us, at some distance to the southward, and running out in an easterly direction from the mountains, stretched a sierra, having at the eastern end (perhaps fifty miles distant) some snowy peaks, on which, by the information of our guide, snow rested all the year.

"Our cavalcade made a strange and grotesque appearance, and it was impossible to avoid reflecting upon our position and composition in this remote solitude. Within two degrees of the Pacific Ocean; already far south of the latitude of Monterey; and still forced on south by a desert on one hand and a mountain range on the other; guided by a civilised Indian; attended by two wild ones from the Sierra; a Chinook from the Columbia; and our own mixture of American, French, German—all armed; four or five languages heard at once; above a hundred horses and mules, half wild; American, Spanish, and Indian dresses and equipments intermingled—such was our composition. Scouts ahead and on the flanks; a front and rear division; the pack animals, baggage, and horned cattle in the centre; and the whole stretching a quarter of a mile along our dreary path. In this form we journeyed; looking more as if we belonged to Asia than to the United States of America."

By observation, the latitude of the camp in the evening was 34 deg. 41 min. 42 sec.; and longitude 118 deg. 20 min.; and on the following day the most southerly point in latitude 54 deg. 27 min. 03 sec., longitude 117 deg. 13 min. west.

They continued travelling over a mountainous country near, or along ridges, until the 25th of April, when "The country assumed the character of an elevated and mountainous desert; its general features being black, rocky ridges, bald, and destitute of timber, with sandy basins between. Where the sides of these ridges are washed by gulleys, the plains below are strewed with beds of large pebbles or rolled stones, destructive to our soft-footed animals, accustomed to the grassy plains of the Sacramento valley. Through these sandy basins

sometimes struggled a scanty stream, or occurred a hole of water, which furnished camping grounds for travellers. Frequently in our journey across, snow was visible on the surrounding mountains; but their waters rarely reached the sandy plain below, where we toiled along, oppressed with thirst and a burning sun. But throughout this nakedness of sand and gravel were many beautiful plants and flowering shrubs, which occurred in many new species, and with greater variety than we had been accustomed to see in the most luxuriant prairie countries. This was a peculiarity of this desert; even where no grass would take root, the naked sand would bloom with some rich and rare flower, which found its appropriate home in the arid and barren spot.

"Scattered over the plain, and tolerably abundant, was a handsome leguminous shrub, three or four feet high, with fine bright purple flowers. It is a new *psoralea*, and occurred frequently henceforward along our road.

Beyond the first ridge, the route followed was a little to the east of north, towards a gap in the mountains. They arrived at the *Agua de Tomaso*, the spring where horses had been left for them, but they had been driven off by the Indians. Carson, Godey, and a Mexican, well mounted, rode off in pursuit of the Indians and the horses.

Next day, a war-whoop was heard, and Carson and Godey appeared, driving before them the horses which had been stolen. Captain Fremont then observes;—

"Two bloody scalps, dangling from the end of Godey's gun, announced that they had overtaken the Indians as well as the horses. They informed us, that after Fuentes, the Mexican, left them, from the failure of his horse, they continued the pursuit alone, and towards nightfall entered the mountains, into which the trail led. After sunset the moon gave light, and they followed the trail by moonshine until late in the night, when it entered a narrow defile, and was difficult to follow. Afraid of losing it in the darkness of the defile, they tied up their horses, struck no fire, and lay down to sleep in silence and in darkness. Here they lay from midnight till morning. At daylight they resumed the pursuit, and about sunrise discovered the horses; and, immediately dismounting and tying up their own, they crept cautiously to a rising ground which intervened, from the crest of which they perceived the encampment of four lodges close by. They proceeded quietly, and had got within thirty or forty yards of their object, when a movement among the horses discovered them to the Indians; giving the war-shout, they instantly charged into the camp, regardless of the number which the *four* lodges would imply. The Indians received them with a flight of arrows shot from their long bows, one of which passed through Godey's shirt-collar, barely missing the neck; our men fired their rifles upon a steady aim, and rushed in. Two Indians were stretched on the ground, fatally pierced with bullets; the rest fled, except a lad that was captured. *The scalps of the fallen were*

instantly stripped off; but in the process, one of them, who had two balls through his body, sprung to his feet, the blood streaming from his skinned head, and uttered a hideous howl. An old squaw, possibly his mother, stopped and looked back from the mountain side she was climbing, threatening and lamenting. The frightful spectacle appalled the stout hearts of our men; but they did what humanity required, and quickly terminated the agonies of the gory savage. They were now masters of the camp, which was a pretty little recess in the mountain, with a fine spring, and apparently safe from all invasion. Great preparations had been made to feast a large party, for it was a very proper place for a rendezvous, and for the celebration of such orgies as robbers of the desert would delight in. Several of the best horses had been killed, skinned, and cut up; for the Indians, living in mountains, and only coming into the plains to rob and murder, make no other use of horses than to eat them. Large earthen vessels were on the fire, boiling and stewing the horse beef; and several baskets, containing fifty or sixty pairs of moccasins, indicated the presence, or expectation, of a considerable party. They released the boy, who had given strong evidence of the stoicism, or something else, of the savage character, in commencing his breakfast upon a horse's head as soon as he found that he was not to be killed, but only tied as a prisoner. Their object accomplished, our men gathered up all the surviving horses, fifteen in number, returned upon their trail, and rejoined us at our camp in the afternoon of the same day. They had rode about 100 miles in the pursuit and return, and all in about thirty hours. The time, place, object, and numbers, considered, this expedition of Carson and Godey may be considered among the boldest and *most disinterested* which the annals of western adventure, so full of daring deeds, can present. Two men, in a savage desert, pursue day and night, an unknown body of Indians into the defiles of an unknown mountain—attack them on sight, without counting numbers—and defeat them in an instant—and for what? To punish the robbers of the desert, and to avenge the wrongs of Mexicans whom they did not know. I repeat: it was Carson and Godey who did this—the former an *American*, born in the *Boonslick* county of Missouri; the latter a Frenchman, born in St. Louis—and both trained to western enterprise from early life.”

On the 29th of April the expedition reached the *Archillette*, where the Mexican party had been attacked. The party had traversed a part of the desert the most sterile and repulsive that they had yet seen. “Its prominent features were dark *sierras*, naked and dry; on the plains a few straggling shrubs—among them, cactus of several varieties. Fuentes pointed out one called by the Spaniards *bisnada*, which has a juicy pulp, slightly acid, and is eaten by the traveller to allay thirst. The course was generally north; and, after crossing an intervening ridge, we descended into a sandy plain, or basin, in the middle of which was the grassy spot, with its springs and willow bushes, which constitutes a camping-place in

the desert, and is called the *Archillette*. The dead silence of the place was ominous; and galloping rapidly up, they found only the corpses of the two men: every thing else was gone. When we beheld this pitiable sight, and pictured to ourselves the fate of the two women, carried off by savages so brutal and so loathsome, all compunction for the scalped-alive Indian ceased; and we rejoiced that Carson and Godey had been able to give so useful a lesson to these American Arabs, who lie in wait to murder and plunder the innocent traveller. By observation its latitude of the place was 35 deg. 51 min. 21 sec.

On the 9th or 10th of May, one of the party, named Tabeau, was killed by the Indians. "We went," says Captain Fremont, "to the spot where the appearance of puddled blood had been seen; and this, we saw at once, had been the place where he fell and died. From the place where he lay and bled, it could be seen that he had been dragged to the river bank, and thrown into it. No vestige of what had belonged to him could be found, except a fragment of his horse equipment. Horse, gun, clothes—all became the prey of these Arabs of the New World.

"Tabeau had been one of our best men, and his unhappy death spread a gloom over our party. Men who have gone through such dangers and sufferings as we had seen become like brothers, and feel each other's loss. To defend and avenge each other is the deep feeling of all. We wished to avenge his death, but the condition of our horses, languishing for grass and repose, forbade an expedition into unknown mountains. We knew the tribe who had done the mischief—the same which had been insulting our camp. They knew what they deserved, and had the discretion to show themselves to us no more. The day before, they infested our camp; now, not one appeared; nor did we ever afterwards see but one who even belonged to the same tribe, and he at a distance."

The morning of the 11th of May was cloudy and cool, with a shower of rain—the first since their entering the desert, a period of twenty-seven days; and they now experienced the usual weather of the Rocky Mountains.

On the 12th of May they encamped on the summit of the ridge which forms the dividing chain between the waters of the *Rio Virgen*, which flows south to the Colorado, and those of Sevier River, flowing northwardly into the Great Basin. "We considered ourselves," says Captain Fremont, "as crossing the rim of the Great Basin; and, entering at this point, we found here an extensive mountain meadow, rich in bunch grass, and fresh with numerous springs of clear water, all refreshing and delightful to look upon. It was, in fact, that *las Vegas de Santa Clara*, which had been so long presented to us as the terminating point of the desert, and where the annual caravan from California to New Mexico halted and recruited for some weeks. It was a very suitable place to recover from the fatigue and exhaustion of a month's suffering in the hot and sterile desert. The meadow was about a mile wide, and some ten miles long, bordered by grassy hills and mountains—some of the latter rising 2000 feet, and white with snow down to the level of the *Vegas*.

Its elevation above the sea was 5280 feet; latitude, by observation, 37 deg. 28 min. 28 sec.; and its distance from where we first struck the Spanish trail about 400 miles. Counting from the time we reached the desert, and began to skirt, at our descent from Walker's Pass in the Sierra Nevada, we had travelled 550 miles, occupying twenty-seven days, in that inhospitable region. In passing before the great caravan, we had the advantage of finding more grass, but the disadvantage of finding also the marauding savages, who had gathered down upon the trail, waiting the approach of their prey. This greatly increased our labours, besides costing us the life of an excellent man. We had to move all day in a state of watch, and prepared for combat—scouts and flankers out, a front and rear division of our men, and baggage animals in the centre. At night, camp duty was severe. Those who had toiled all day had to guard, by turns, the camp and the horses all night. Frequently one-third of the whole party were on guard at once, and nothing but this vigilance saved us from attack. We were constantly dogged by bands, and even whole tribes of these marauders: and although Ta-beau was killed, and our camp infested and insulted by some, while swarms of them remained on the hills and mountain sides, there was manifestly a consultation and calculation going on to decide the question of attacking us.

“After we left the *Vegas*, we had the gratification to be joined by the famous hunter and trapper, Mr. Joseph Walker, who now became our guide. He had left California with the great caravan, and perceiving from the signs along the trail that there was a party of whites ahead, which he judged to be mine, he detached himself from the caravan, with eight men (Americans), and ran the gauntlet of the desert robbers, killing two, and getting some of the horses wounded, and succeeded in overtaking us. Nothing but his great knowledge of the country, great courage, and presence of mind, and *good rifles*, could have brought him safe from such a perilous enterprise.”

The expedition remained one day at *las Vegas de Santa Clara*; and then travelled in a north-eastwardly direction into a broad valley, the water of which is tributary to Sevier Lake. The next day they came in sight of the Wah-satch range of mountains on the right, white with snow, and forming the south-east boundary of the Great Basin. Sevier Lake, upon the waters of which they now were, belongs to the lakes of the eastern part of the basin—of which the Great Salt Lake and the Utah Lake, are the principal. They travelled for several days within the rim of the Great Basin, crossing little streams which flowed to the left into Sevier Lake, and, by the changed aspect of the country, they were entirely clear of the desert, and approaching the region of the Rocky Mountains.

Captain Fremont then observes;—“After 440 miles of travelling on a trail, which served for a road, we again found ourselves under the necessity of exploring a track through the wilderness. The Spanish trail had borne off to the south-east, crossing the *Wah-satch* range. Our course led to the north-

east, along the foot of that range, and leaving it on the right. We had now entered a region of great pastoral promise, abounding with fine streams, the rich bunch grass, soil that would produce wheat, and indigenous flax growing as if it had been sown. Consistent with the general character of its bordering mountains, this fertility of soil and vegetation does not extend far into the Great Basin. Mr. Joseph Walker, our guide, and who has more knowledge of these parts than any man I know, informed me that all the country to the left was unknown to him, and that even the *Digger* tribes, which frequented Lake Sevier, could tell him nothing about it.

"May 20.—We met a band of Utah Indians, headed by a well-known chief, who had obtained the American or English name of Walker, by which he is quoted and well known. They were all mounted, armed with rifles, and use their rifles well. The chief had a fusil, which he had carried slung, in addition to his rifle. They were journeying slowly towards the Spanish trail, to levy their usual tribute upon the great California Caravan. They were robbers of a higher order than those of the desert. They conducted their depredations with form, and under the colour of trade and toll for passing through their country. Instead of attacking and killing, they affect to purchase—taking the horses they like, and giving something nominal in return. The chief was quite civil to me. He was personally acquainted with his namesake, our guide, who made my name known to him. He knew of my expedition of 1842; and as tokens of friendship, and proof that we had met, proposed an interchange of presents. We had no great store to choose out of; so he gave me a Mexican blanket, and I gave him a very fine one which I had obtained at Vancouver.

"From the *Dalles* to the point where we turned across the Sierra Nevada, near 1000 miles, we heard Indian names, and the greater part of the distance none; from Nueva Helvetia (Sacramento) to *las Vegas de Santa Clara*, about 1000 more, all were Spanish, from the Mississippi to the Pacific, French and American or English were intermixed; and this prevalence of names indicates the national character of the first explorers."

Here one of his men, François Badeau, was killed in drawing towards him a gun by the muzzle: the hammer being caught, discharged the gun, driving the ball through his head. They buried him on the banks of the river.

On the 25th of May, they came in sight of the Utah Lake; and, as they descended to the broad bottoms of the Spanish fork, three horsemen were seen galloping towards them who proved to be Utah Indians—scouts from a village which was encamped near the mouth of the river. They were armed with rifles, and their horses were in good condition.

On arriving at the Utah Lake, Captain Fremont remarks;—"We had completed an immense circuit of 12 deg. north and south, and 10 deg. east and west; and found ourselves, in May, 1844, on the same sheet of water which we had left in Sep-

tember, 1843. The Utah is the southern limb of the Great Salt Lake; and thus we had seen that remarkable sheet of water both at its northern and southern extremity, and were able to fix its position at these two points. The circuit which we had made, and which had cost us eight months of time and 3500 miles of travelling, had given us a view of Oregon and of North California from the Rocky Mountains to the Pacific Ocean, and of the two principal streams which form bays or harbours on the coast of that sea. Having completed this circuit, and being now about to turn the back upon the Pacific slope of our continent, and to recross the Rocky Mountains, it is natural to look back upon our footsteps, and take some brief view of the leading features and general structure of the country we had traversed. These are peculiar and striking, and differ essentially from the Atlantic side of our country. The mountains are all higher, more numerous, and more distinctly defined in their ranges and directions; and, what is so contrary to the natural order of such formations, one of these ranges, which is near the coast (the Sierra Nevada and the Coast Range), presents higher elevations and peaks than any which are to be found in the Rocky Mountains themselves. In our eight months' circuit, we were never out of sight of snow; and the Sierra Nevada, where we crossed it, was near 2000 feet higher than the South Pass in the Rocky Mountains. In height, these mountains greatly exceed those of the Atlantic side, constantly presenting peaks which enter the region of eternal snow; and some of them volcanic, and in a frequent state of activity. They are seen at great distances, and guide the traveller in his course.

"The course and elevation of these ranges give direction to the rivers and character to the coast. No great river does, or can, take its rise below the Cascade and Sierra Nevada range; the distance to the sea is too short to admit of it. The rivers of the San Francisco Bay, which are the largest after the Columbia, are local to that bay, and lateral to the coast, having their sources about on a line with the Dalles of the Columbia, and running each in a valley of its own, between the Coast Range and the Cascade and the Sierra Nevada range. The Columbia is the only river which traverses the whole breadth of the country, breaking through all the ranges, and entering the sea. Drawing its waters from a section of ten degrees of latitude in the Rocky Mountains, which are collected into one stream by three main forks (Lewis's, Clark's, and the North Fork), near the centre of the Oregon valley, this great river thence proceeds by a single channel to the sea, while its three forks lead each to a pass in the mountains, which opens the way into the interior of the continent. This fact, in relation to the rivers of this region, gives an immense value to the Columbia. Its mouth is the only inlet and outlet to and from the sea; its three forks lead to the passes in the mountains; it is therefore the only line of communication between the Pacific and the interior of North America; and all operations of war or commerce, of national or social intercourse, must be conducted upon it. This

gives it a value beyond estimation, and would involve irreparable injury if lost. In this unity and concentration of its waters, the Pacific side of our continent differs entirely from the Atlantic side, where the waters of the Alleghany Mountains are dispersed into many rivers, having their different entrances into the sea, and opening many lines of communication with the interior.

“The Pacific coast is equally different from that of the Atlantic. The coast of the Atlantic is low and open, indented with numerous bays, sounds, and river estuaries, accessible everywhere, and opening by many channels into the heart of the country. The Pacific coast, on the contrary, is high and compact, with few bays, and but one that opens into the heart of the country. The immediate coast is what the seamen call *iron bound*. A little within, it is skirted by two successive ranges of mountains, standing as ramparts between the sea and the interior country; and to get through which there is but one gate, and that narrow and easily defended. This structure of the coast, backed by these two ranges of mountains, with its concentration and unity of waters, gives to the country an immense military strength, and will probably render Oregon the most impregnable country in the world.

“Differing so much from the Atlantic side of our continent in coast, mountains, and rivers, the Pacific side differs from it in another most rare and singular feature—that of the Great Interior Basin, of which I have so often spoken, and the whole form and character of which I was so anxious to ascertain. Its existence is vouched for by such of the American traders and hunters as have some knowledge of that region; the structure of the Sierra Nevada range of mountains requires it to be there; and my own observations confirm it. Mr. Joseph Walker, who is so well acquainted with those parts, informed me that, from the Great Salt Lake west, there was a succession of lakes and rivers which have no outlet to the sea, nor any connexion with the Columbia, or with the Colorado of the Gulf of California. He described some of these lakes as being large, with numerous streams, and even considerable rivers, falling into them. In fact, all concur in the general report of these interior rivers and lakes; and, for want of understanding the force and power of evaporation, which so soon establishes an equilibrium between the loss and supply of waters, the fable of whirlpools and subterraneous outlets has gained belief, as the only imaginable way of carrying off the waters which have no visible discharge. The structure of the country would require this formation of interior lakes; for the waters which would collect between the Rocky Mountains and Sierra Nevada, not being able to cross this formidable barrier, nor to get to the Columbia or the Colorado, must naturally collect into reservoirs, each of which would have its little system of streams and rivers to supply it. This would be the natural effect; and what I saw went to confirm it. The Great Salt Lake is a formation of this kind, and quite a large one; and having many streams, and one considerable river, 400 or 500 miles long, falling

into it. This lake and river I saw and examined myself; and also saw the Wah-satch and Bear River Mountains which enclosed the waters of the lake on the east, and constitute in that quarter, the rim of the Great Basin. Afterwards, along the eastern base of the Sierra Nevada, where we travelled for forty-two days, I saw the line of lakes and rivers which lie at the foot of that Sierra; and which Sierra is the western rim of the basin. In going down Lewis's Fork and the main Columbia, I crossed only inferior streams coming in from the left, such as could draw their water from a short distance only; and I often saw the mountains at their heads, white with snow, which all accounts said, divided the waters of the *desert* from those of the Columbia, and which could be no other than the range of mountains which from the rim of the basin on its northern side. And in returning from California along the Spanish trail, as far as the head of the Santa Clara Fork of the Rio Virgen, I crossed only small streams making their way south to the Colorado, or lost in sand—as the Mo-hah-ve; while to the left, lofty mountains, their summits white with snow, were often visible, and which must have turned water to the north as well as to the south, and thus constituted, on this part, the southern rim of the Basin. At the head of the Santa Clara Fork, and in the Vegas de Santa Clara, we crossed the ridge which parted the two systems of waters. We entered the Basin at that point, and have travelled in it ever since, having its south-eastern rim (the Wah-satch Mountain) on the right, and crossing the streams which flow down into it. The existence of the Basin is therefore an established fact in my mind; its extent and contents are yet to be better ascertained. It cannot be less than 400 or 500 miles each way, and must lie principally in the Alta California; the demarcation latitude of 42 deg. probably cutting a segment from the north part of the rim. Of its interior but little is known. It is called a *desert*, and, from what I saw of it, sterility may be its prominent characteristic; but where there is so much water, there must be some *oasis*. The great river, and the great lake, reported, may not be equal to the report; but where there is so much snow, there must be streams; and where there is no outlet, there must be lakes to hold the accumulated waters, or sands to swallow them up. In this eastern part of the Basin, containing Sevier, Utah, and the Great Salt lakes, and the rivers and creeks falling into them, we know there is good soil and good grass, adapted to civilised settlements. In the western part, on the Salmon-trout River, and some other streams, the same remark may be made.

“The contents of this great basin are yet to be examined. That it is peopled, we know, but miserably and sparsely. From all that I heard and saw, I should say that humanity here appeared in its lowest form, and in its most elementary state. Dispersed in single families, without fire-arms, eating seeds and insects, digging roots (and hence their name), such is the condition of the greater part. Others are a degree higher, and live in communities upon some lake or river that supplies

fish, and from which they repulse the miserable *Digger*. The rabbit is the largest animal known in this desert: its flesh affords a little meat, and their bag-like covering is made of its skins. The wild sage is their only wood, and here it is of extraordinary size, sometimes a foot in diameter, and six or eight feet high. It serves for fuel, for building material, for shelter to the rabbits, and for some sort of covering for the feet and legs in cold weather. Such are the accounts of the inhabitants and productions of the Great Basin; and which, though imperfect, must have some foundation, and excite our desire to know the whole.

“The whole idea of such a desert, and such a people, is a novelty in our country, and excites Asiatic, not American, ideas. Interior basins, with their own systems of lakes and rivers, and often sterile, are common enough in Asia; people still in the elementary state of families, living in deserts, with no other occupation than the mere animal search for food, may still be seen in that ancient quarter of the globe; but in America such things are new and strange, unknown and unsuspected, and discredited when related. But I flatter myself that what is discovered, though not enough to satisfy curiosity, is sufficient to excite it, and that subsequent explorations will complete what has been commenced.

“This account of the Great Basin, it will be remembered, belongs to the Alta California, and has no application to Oregon, whose capabilities may justify a separate remark. In general and comparative terms, that, in that branch of agriculture which implies the cultivation of grains and staple crops, it would be inferior to the Atlantic states, though many parts are superior for wheat, while in the rearing of flocks and herds it would claim a high place. Its grazing capabilities are great, and even in the indigenous grass now there, an element of individual and national wealth may be found. In fact, the valuable grasses begin within 150 miles of the Missouri frontier, and extend to the Pacific Ocean. East of the Rocky Mountains, it is the short curly grass, on which the buffalo delight to feed (whence its name of buffalo) and which is still good when dry and apparently dead. West of those mountains it is a larger growth, in clusters, and hence called bunch grass, and which has a second or fall growth. Plains and mountains both exhibit them; and I have seen good pasturage at an elevation of 10,000 feet. In this spontaneous product, the trading or travelling caravans can find subsistence for their animals; and in military operations any number of cavalry may be moved, and any number of cattle may be driven; and thus men and horses be supported on long expeditions, and even in winter, in the sheltered situations.

“Commercially, the value of the Oregon country must be great, washed as it is by the North Pacific Ocean, fronting Asia, producing many of the elements of commerce, mild and healthy in its climate, and becoming, as it naturally will, a thoroughfare for the East India and China trade.

The expedition under Captain Fremont returned from the Utah Lake over the pass by the Spanish branch of the river, and thence across a broken country, of

which the higher parts were rocky, and timbered with cedar, and the lower parts covered with good grass. On the 3rd of June he arrived at Fort Uintah, a trading post belonging to a Mr. Roubideau, on the principal fork of the Uintah River, with a motley garrison of Canadian and Spanish *engagés* and hunters, with the usual number of Indian women.*

The longitude of the post is 109 deg. 56 min. 42 sec., the latitude 40 deg. 27 min. 45 sec.

On the 7th, they journeyed through beautiful little valleys and a high mountain country until they arrived at the verge of a steep and rocky ravine, by which they descended to '*Brown's Hole*:' a place well known to trappers, where the canons through which the Colorado flows, expand into a narrow pretty valley, about sixteen miles in length. The river was several hundred yards in breadth, swollen to the top of its banks, near to which it was in many places fifteen to twenty feet deep. They crossed the river with a skin boat which had been purchased at the fort. According to information, the lower end of this valley forms the most eastern part of the Colorado: the latitude of the encampment, opposite to the remains of an old fort on the left bank of the river, was 40 deg. 46 min. 27 sec., and the elevation above the sea 5150 feet; here the river flowed between lofty precipices of red rock, and the country below is said to assume a very rugged character; the river and its affluents passing through canons which forbid all access to the water. This sheltered little valley was formerly a favourite wintering-ground for the trappers, as it afforded them sufficient pasturage for their animals, and the surrounding mountains are well stocked with game.

After leaving Brown's Hole they advanced over a country which has long been infested by the war-parties of the Sioux and other Indians, and considered among the most dangerous war-grounds in the Rocky Mountains; parties of whites having been repeatedly defeated on this river.

On the 11th of June they encamped a little below a branch of the river, called St. Vrain's Fork. A few miles above was the fort at which Frapp's party had been defeated two years previously; and they passed during the day a place where one of Carson's men was fired upon and had five bullets through his body.

On the 12th they reached the country of, and saw, the buffalo, and welcomed the appearance of two old bulls. As they descended to St. Vrain's Fork, an affluent of Green River, the hunters brought in mountain sheep and the meat of two fat bulls. They killed two fine cows near the camp. A band of elk broke out of a neighbouring grove; antelopes were running over the hills, and on the opposite river plains, herds of buffalo were raising clouds of dust. The country here appeared more variously stocked with game than any

* This fort was attacked and taken by a band of the Utah Indians since Captain Fremont passed it, and the men of the garrison killed and the women carried off. Mr. Roubideau was absent, and so escaped the fate of the rest.

part of the Rocky Mountains they had visited; owing to the excellent pasturage, and its being avoided by the hunters on account of its dangerous character as Indian war-ground.

On the 13th of June they reached the summit towards mid-day, at an elevation of 8000 feet. Captain Fremont says—"With joy and exultation we saw ourselves once more on the top of the Rocky Mountains, and beheld a little stream taking its course towards the rising sun. It was an affluent of the Platte, called *Pullam's Fork*, the name of a trapper who, some years since, was killed here by the *Gros Ventre* Indians. Issuing from the pines in the afternoon, we saw spread out before us the valley of the Platte, with the pass of the Medicine Butte beyond, and some of the Sweet Water Mountains. We were now about two degrees south of the South Pass, and our course home would have been eastwardly; but that would have taken us over ground already examined, and therefore without the interest which would excite curiosity. Southwardly there were objects worthy to be explored, to wit: the approximation of the head waters of three different rivers—the Platte, the Arkansas, and the Grand River Fork of the Rio Colorado of the Gulf of California; the passes at the heads of these rivers, and the three remarkable mountain coves, called Parks, in which they took their rise. The coves, the heads of the rivers, the approximation of these waters, the practicability of the mountain passes, and the locality of the **THREE PARKS**, were all objects of interest, and, although well known to hunters and trappers, were unknown to science and to history. We, therefore, changed our course, and turned up the valley of the Platte instead of going down it. We crossed several small affluents, and again made a fortified camp in a grove. The country had now become very beautiful—rich in water, grass, and game; and to these were added the charm of scenery and pleasant weather.

"Our route this morning (June 14) lay along the foot of the mountain, over the long low spurs which sloped gradually down to the river, forming the broad valley of the Platte. The country is beautifully watered. In almost every hollow ran a clear, cool, mountain stream; and in the course of the morning we crossed seventeen, several of them being large creeks, forty to fifty feet wide, with a swift current, and tolerably deep. These were variously wooded with groves of aspen and cotton-wood, with willow, cherry, and other shrubby trees. Buffalo, antelope, and elk, were frequent during the day.

"Encamped on a pretty stream, where there were several beaver-dams, and many trees recently cut down by the beaver. We gave to this the name of Beaver Dam Creek, as now they are becoming sufficiently rare to distinguish by their name the streams on which they are found. In this mountain they occurred more abundantly than elsewhere in all our journey, in which their vestiges had been scarcely seen.

"The next day we had an animated chase after a grizzly bear, which we tried to lasso. Fuentes threw the lasso upon his neck, but it slipped off, and he escaped into the dense thickets of the creek. Our course in the afternoon brought us to the main Platte River, here a handsome stream, with a uniform breadth of seventy yards, except where widened by frequent islands. It was apparently deep, with a moderate current, and wooded with groves of large willow.

"The valley narrowed as we ascended, and presently degenerated into a gorge, through which the river passed as through a gate. We entered it, and found ourselves in the New Park—a beautiful circular valley of thirty miles' diameter, walled in all round with snowy mountains, rich with water and with grass, fringed with pine on the mountain sides below the snow line, and a paradise to all grazing animals. The Indian name for it signifies '*cow lodge*,' of which our own may be considered a translation; the enclosure, the grass, the water, and the herds of buffalo roaming over it, naturally presenting the idea of a park. We halted for the night just within the gate, and expected, as usual, to see herds of buffalo; but an Arapahoe village had been before us, and not one was to be seen. Latitude of the encampment, 40 deg. 52 min. 44 sec. Elevation by the boiling point, 7720 feet.

"It is from this elevated *cove*, and from the gorges of the surrounding mountains, and some lakes within their bosoms, that the Great Platte River collects its first waters, and assumes its first form; and certainly no river could ask a more beautiful origin.

"We continued our way among the waters of the Park, over the foot hills of the bordering mountains, where we found good pasturage, and surprised and killed some buffalo. We fell into a broad and excellent trail made by buffalo, where a waggon would pass with ease; and, in the course of the morning, we crossed the summit of the Rocky Mountains, through a pass which was one of the most beautiful we had ever seen. The trail led among the aspens, through open grounds, richly covered with grass, and carried us over an elevation of about 9000 feet above the level of the sea.

"The country appeared to great advantage in the delightful summer weather of the mountains, which we still continued to enjoy. Descending from the pass, we found ourselves again on the western waters; and halted on the edge of another mountain valley, called the Old Park, in which is formed Grand River, one of the principal branches of the *Colorado* of California. We were now moving with some caution, as, from the trail, we found the Arapahoe village had also passed this way. As we were coming out of their enemy's country, and this was a war-ground, we were desirous to avoid them. The appearance of the country in the Old Park is interesting, though of a different character from the New; instead of being a comparative plain, it is more or less broken into hills,

and surrounded by the high mountains, timbered on the lower parts with quaking asp and pines.

"On the 18th of June our scouts, who were as usual ahead, made from a *butte* this morning the signal of Indians. We had scarcely made our few preparations, when about 200 of them appeared on the verge of the bottom, mounted, painted, and armed for war. We planted the American flag between us; and a short parley ended in a truce, with something more than the usual amount of presents. It will be remembered that it is customary for this people to attack the trading parties which they meet in this region, considering all whom they meet on the western side of the mountains to be their enemies.

"The next morning we descended the river for about eight miles, and halted a short distance above a canon, through which Grand River issues from the Park. Here it was smooth and deep, 150 yards in breadth, and its elevation at this point 6700 feet. A frame for the boat being very soon made, our baggage was ferried across; the horses, in the mean time, swimming over.

"The shade of the pines, and the weather, were most delightful on the 20th. The country was literally alive with buffalo: and the continued echo of the hunters' rifles on the other side of the river for a moment made me uneasy, thinking perhaps they were engaged with Indians; but in a short time they came into camp with the meat of seven fat cows.

"In the afternoon the river forked into three apparently equal streams; broad buffalo trails leading up the left hand, and the middle branch indicating good passes over the mountains; but up the right hand branch (which, in the object of descending from the mountain by the main head of the Arkansas, I was most desirous to follow), there was no sign of a buffalo trace. Apprehending, from this reason, and the character of the mountains, which are known to be extremely rugged, that the right-hand branch led to no pass, I proceeded up the middle branch, which formed a flat valley bottom between timbered ridges on the left and snowy mountains on the right, terminating in large *buttes* of naked rock. The trail was good, and the country interesting; and at nightfall we encamped in an open place among the pines, where we built a strong fort."

Next morning, a party of six trappers, who had ventured out among the mountains after beaver, informed Captain Fremont that two of their number had been killed by the Indians, one of them but a few days since, by the Arapahoes. By the temperature of boiling water, the elevation of the camp was 10,430 feet; and the pine forest and good grass still continued.

The captain proceeded upwards, occasionally through open pines, with a very gradual ascent. They surprised a herd of buffalo near a small lake among pines. Having ascended about 800 feet from the camp, he reached the SUMMIT OF THE DIVIDING RIDGE, which was calculated to be 11,200 feet above the sea. Here the river spreads itself into small branches and springs, heading nearly in

the summit of the ridge, which is very narrow. Immediately below was a green valley, through which ran a stream; and a short distance opposite rose snowy mountains, whose summits were formed into peaks of naked rock.

He descended from the summit of the pass into the creek below, and encamped on a bottom of good grass near its head, which gathers its waters in the crest of the Rocky Mountains, and, according to the best information he could obtain, separated only by the rocky wall of the ridge from the head of the main Arkansas river. By observations, the latitude of the encampment was 39 deg. 20 min. 24 sec., and south of which he laid down, the head of the Arkansas River. A band of buffalo furnished some excitement, by charging through the camp in the evening.

On the following day they descended the stream by a buffalo trail, along the open grassy bottom of the river. On the right, the bayou was bordered by a mountainous range, crested with rocky naked peaks. Below the country exhibited "a beautiful park-like character of pretty level prairies, interspersed among low spurs, wooded openly with pine and quaking asp, contrasting well with the denser pines which swept around on the mountain sides." Descending the valley of the stream, they met a party of Utah women, who informed them that on the other side of the ridge their village was fighting with the Arapahoes: they filled the air with cries and lamentations, to make it understood that some of their chiefs had been killed.

Pike's Peak was in view from the encampment. It bore N. 87 deg. E. by compass.

On returning from this region, after several days' laborious travelling, the expedition left the mountains, and on the morning of the 28th encamped immediately at their foot, on a tributary of the Arkansas River, and on the 1st of July arrived at Bent's Fort, about seventy miles below the mouth of the *Fontaine-qui-bouit*.

Captain Fremont left the Arkansas, about twenty miles below the fort, to examine the Kansas, and he observes, "The country through which we had been travelling since leaving the Arkansas River, for a distance of 260 miles, presented to the eye only a succession of far-stretching green prairies, covered with unbroken verdure of the buffalo grass, and sparingly wooded along the streams with straggling trees and occasional groves of cotton-wood; but here the country began perceptibly to change its character, becoming a more fertile, wooded, and beautiful region, covered with a profusion of grasses, and watered with innumerable little streams, which were wooded with oak, large elms, and the usual varieties of timber common to the lower course of the Kansas River. As we advanced, the country improved, gradually assimilating in appearance to the north-western part of Missouri. The beautiful sward of the buffalo grass, which is regarded as the best and most nutritious found on the prairies, appeared now

only in patches, being replaced by a longer and coarser grass, which covered the face of the country luxuriantly. The difference in the character of the grasses became suddenly evident in the weakened condition of our animals, which began sensibly to fail as soon as we quitted the buffalo grass.

“The river preserved a uniform breadth of eighty or a hundred yards, with broad bottoms continuously timbered with large cotton-wood trees, among which were interspersed a few other varieties.

“After having travelled directly along its banks for 290 miles, we left the river, where it bore suddenly off in a north westerly direction, towards its junction with the Republican Fork of the Kansas, distant about sixty miles ; and, continuing our easterly course, in about twenty miles we entered the waggon road from Santa Fé to Independence, and on the last day of July encamped again at the little town of Kansas, on the banks of the Missouri River.

“During our protracted absence of fourteen months, in the course of which we had necessarily been exposed to great varieties of weather and of climate, no one case of sickness had ever occurred among us.

“Here ended our land journey : and the day following our arrival, we found ourselves on board a steamboat rapidly gliding down the broad Missouri. Our travel-worn animals had not been sold and dispersed over the country to renewed labour, but were placed at good pasturage on the frontier, and are now ready to do their part in the coming expedition. On the 6th of August we arrived at St. Louis, where the party was finally disbanded ; a great number of the men having their homes in the neighbourhood.”

The extracts and condensed accounts which we have prepared from the narratives of exploring expeditions, from the recent travels of Americans in Mexico and California, although but embracing but a very limited portion of the actual letter-press of these narratives and travels, afford, in a compressed form, all the really important information recently obtained of countries hitherto but very imperfectly known : and the importance of the circumstance which now involve the future destinies of Oregon, California, and Mexico, and of the progress of the Anglo-Saxon race in America, constitute, we believe, a full justification of the length to which we have extended these chapters.

CHAPTER XXIX.

CONSTITUTION OF MEXICO.

AFTER the overthrow of the Imperial Government of Iturbide, a national representative body met, and before separating, at the end of fourteen months, agreed to a federal constitution, embracing the original royal states of New Spain. It was proclaimed on the 4th of October, 1824.* The first congress under it met on the 1st of January, 1825, with General Victoria, as president of the federal republic. *Discord* and *Pronunciamientos* followed. One cabal declared that no man of Spanish birth should fill any public office. One opposed the federation, another the central system. Centralists were called *Escossais*, or Scotch—the federalists, the *Yorkinos*, or Yorkists: strange names for Spanish races. Sanguinary revolutions and insurrections continued. Rulers were overturned, or replaced, or executed. After the execution of President Guerera, in 1831, an exiled president Pedraza, was recalled to serve out three months of his allotted term. Santa Anna succeeded in 1833. *Pronunciamientos* and insurrections were vigorously, and not very mercifully, quelled by him.

In the first year of his presidency, a “*Pronunciamiento*” was made in favour of the “*fueros*” of the church and army. The latter proclaimed him Dictator

* This constitution was, with the exception of the article on religion, founded on the articles of the constitution of the United States of North America. Each of the Mexican states was to preserve the right of changing and modifying its state government, provided it retained the republican form. The congress of the Union was to consist of the president and the vice-president, and of two legislative bodies, the senate and the house of representatives. The senate to be composed of twice as many members as there are states; every state sending two senators, elected by the legislative bodies of the state. The number of the members of the house of representatives were not limited. Every district containing a population of between 40,000 and 80,000 inhabitants, were entitled to choose a representative; a census was to be made every ten years. The legislative bodies to meet on the 1st of January, and continue to the 15th of April; but if necessary, might prolong it one month. The president might call an extraordinary meeting of the legislative bodies. The representatives were to be elected for two years; the senators for four years.

The president, or executive, to be chosen by the legislative bodies of the different states. Every state to name two candidates, one of whom not to be a citizen of the state; the congress to declare the person to be duly elected, as chosen by the majority of the states. The vice-president to be chosen in the same manner. The president and vice-president to remain four years in office. The president to appoint the secretaries of state, and the officers in the army and navy; to be commander-in-chief of the forces, to treat with foreign powers, and cause the laws enacted by the congress to be published and executed. But he was required to consult the privy council, in which every state was represented by one member.

Disputes arising between the authorities of the United States or their citizens were to be decided by a superior court, consisting of eleven members, chosen by the legislative bodies of the states. That court to explain the true meaning of the laws whenever they are obscure, and to determine the limits of the jurisdiction of the federal courts of the republic. The crimes or misdemeanours of senators, representatives, ambassadors, consuls, and other public officers of the first rank, to be also tried by this court.

at Cuautla—he refused to accept—and marched against and subdued the insurgents at Guanajuato.

In 1835, a “*Pronunciamiento*” was published and quelled in Zacatecas. A few days after this victory there was another, called the “Plan of Toluca,” which was generally believed to have been framed by Santa Anna.

This plan was fatal to the federal system. It destroyed the constitution of 1824, vested the power in a central government, abolished the legislatures of the states, and changed those states into departments, under the control of military commandants and governors, responsible only to the chief authorities of the republic. This last bold act of Santa Anna, previous to his capture in Texas, formed in its principles, the basis of the “Central Constitution,” adopted in 1836, instead of the federal constitution of 1824.

This *de facto* dictator of his own country, and the conqueror of the Spaniards, lost his liberty by being defeated and taken prisoner by the Americans at San Jacinto. He was liberated, and returned through the United States to Mexico, and having become exceedingly unpopular, retired to his farm at Manga de Clavo.

When Santa Anna departed for Texas, Barrigan, whom he left in his absence as president, died, and Coro assumed the administration, until Bustamente (a former president), whose friends had elected him to the presidency under the new and central constitution, returned from France, where he had lived obscure since his defeat at Tenhilon, in 1830, by Santa Anna.

In 1838, the unfortunate Mexia advanced towards the capital of Mexico with a considerable army. He was met in the neighbourhood of Puebla by Santa Anna. Mexia was defeated, taken prisoner, and immediately shot, by order of Santa Anna.*

Soon after Vera Cruz was blockaded by a French squadron, and attacked by the French troops. Santa Anna at once repaired to the port and assumed the command of the troops. While following the French, as they retreated to their boats, he was wounded in the leg.†

He remained quiet during the “*Pronunciamiento*” of the Federalists under

* Mr. Mayer, in two notes informs us, “You are right,” said he to Santa Anna, when he was refused a respite: ‘I would not have granted you half the time, had I conquered!’”

† “Santa Anna,” says Mr. Mayer, “causes the 5th of December to be celebrated in Mexico, as a day of victory over the French! They tell a story of him at Vera Cruz, which is illustrative of his cunning. One morning, early, during the siege, a party of French soldiers had made its way into the town and got possession of the house in which Santa Anna was lodged. As soon as he was disturbed by the noise of the troops, he jumped out of bed, and in his shirt and trowsers, attempted to escape. On the stairs he met the soldiers, headed by the Prince de Joinville, who immediately demanded, ‘Where is Santa Anna?’ ‘There,’ said he, pointing over his shoulder with his thumb to a room in which another general was quietly sleeping.’ ‘And who are you?’ said the Prince; ‘Oh! nobody,’ said Santa Anna, ‘nobody but a servant of the house.’ The prince pushed on in a hurry to secure the general, while the general as hurriedly pushed for the door!”—Santa Anna was evidently no favourite of Mr. Mayer.

Urrea, at the palace of Mexico, on the 15th of July, 1840, which was suppressed by Valencia.

In August 1841, an insurrection was announced by the "*Pronunciamiento*" of Paredes in Guadalajara, and enforced by Valencia and Lombardini, in the capital, and by Santa Anna at Vera Cruz. The consumption duty of 15 per cent was one of the grievances complained of; which, with the constitution of 1836, were difficulties entirely beyond the control of the administration of Bustamente. The "*Pronunciamientos*" of those generals were succeeded by a month's contest in the streets of Mexico; a bombardment of the capital; some conflicts between the rival troops of the neighbourhood; the downfall of Bustamente; the elevation of Santa Anna to the provisional presidency, and the "*Plan of Tacubaya*," by the seventh article of which he was invested with dictatorial powers.

By this plan, a congress was to meet in 1842, to form a new constitution. In June of that year, "*a corps of patriotic citizens, chosen by the people, met for that purpose in the capital.*" The provisional president, in a speech, declared forcibly his partiality for a firm and *central* government; but that he should acquiesce in the final decision of the congress.

In December 1842, after two attempts to form a *system* of administration,—the provisional president dissolved the congress, and convened a junta of notables. This junta, headed by Santa Anna, proclaimed on the 13th of June, 1843, "the bases of political organization of the Mexican republic." It is not called a constitution.

By this instrument, it is declared that Mexico adopts the form of a *popular representative* system for its government; that the republic shall be divided into departments; that the political power essentially resides in the nation, and *that the Holy Roman Catholic and Apostolic creed is professed and protected to the exclusion of all others.*

It declares that slavery is not to be permitted;—that no one is to be molested for his political opinions, or called on for contributions, except such as are regularly imposed by law.

It distinguishes who are Mexican citizens, their rights and obligations. Citizens are—all who are born within the Mexican territory, or beyond it, of a Mexican father; all who were alive in Mexico in 1821, and have not renounced their allegiance;—all who were natives of Central America when it belonged to the Mexican nation, and since then have continued to reside in Mexico;—and all who have obtained or shall obtain letters of naturalization.

The rights of citizenship, voting for qualifications, require that they must be eighteen years of age and married, or twenty-one years if not married; and they must enjoy an annual income of at least 200 dollars, derived from actual capital, industry, or honest personal labour. In addition to these requirements, no one will be allowed to vote, after the year 1850, *unless he is able to read and write.*

The rights of citizenship are suspended (among other disqualifications) by domestic servitude, habitual intemperance, taking of religious vows, keeping of prohibited gaming-houses, and fraudulent bankruptcy.

The legislative power is to reside in a congress, divided into a chamber of deputies and a senate.

The *Chamber of Deputies* is to be composed of individuals elected by the electoral colleges of the departments, in a manner which will be hereafter specified, and in the ratio of one for 70,000 inhabitants. The departments which have not so many residents shall, nevertheless, be entitled to a deputy, and there shall likewise be one for every fraction over 35,000. It is required, that a deputy shall be 30 years of age, and possessed of an annual income of 1200 dollars. A moiety of the chamber is to be renewed every two years.

The *Senate* is to be composed of 63 members, two-thirds of whom are to be elected by the departmental assemblies, and the other third by the chamber of deputies, the president of the republic, and the supreme court of justice. One-third of this body is to be renewed biennially. The departmental assemblies are to select five persons from each of the classes of agriculturists, miners, proprietors, or merchants, and manufacturers; the rest of the quota to be chosen by them from distinguished individuals. Those who are to be appointed by the president and the supreme court, are to be taken from among individuals who have signalised themselves in the civil, military, and ecclesiastical career. Senators must possess an annual income of 2000 dollars.

The congress, so constituted, to sit twice a year for the space of three months, commencing its terms on the 1st of January and 1st of July. Its members are not allowed to obtain place or preferment from the government, except for the most imperative reasons.

A third body, called the *Permanent Deputation*, is to be formed by this congress, and will be composed of four members of the senate and five of the chamber, whose term of office shall continue until the next meeting of the national assembly and the election of their successors. The duty of this permanent deputation is to call extra sessions of Congress whenever they may be decreed by the government, and to receive the certificates of the election of president of the republic, senators, and ministers of the supreme court of justice.

The *Executive Power* is confided for five years to a president, who must be a Mexican by birth, in the full enjoyment of all his rights of citizenship, more than forty years of age, and a resident of the republic at the time of his election.

Among the numerous duties prescribed for him by the *bases*, are the following:

To impose fines not exceeding 500 dollars on those who disobey his orders, and are wanting in due respect and obedience to the laws.

To see that prompt justice is administered; to visit the tribunals whenever he is informed of delays, or that prejudicial disorders exist in those bodies; to require that a preference be given to causes concerning the public welfare, and to exact information touching the same whenever it may be deemed proper.

To object (*hacer observaciones*) within thirty days (after audience of the council, which will be hereafter described), to the projects of laws approved by the chambers, suspending their operations in the mean time. If the project be reapproved, the government may suspend it until the near termination of the period when the chambers can consider the subject. If it be then approved by two-thirds of both bodies, the government will be obliged to publish it as a law. If the thirty days terminate after the regular period of the session, the government is to direct its observations to the permanent deputation; and if the term passed without any action by the president, the law will be considered as sanctioned, and published without delay.

The president may declare war, and dispose of the armed forces of the nation as he sees fit, according to the objects of their institution. He may expel from the republic *unnaturalized foreigners*, who are deemed dangerous; and he may name orators from the council to defend the opinions of the government before the chambers.

The *Council of the Government* is to be composed of seventeen persons named by

the president, whose tenure of office is perpetual, and whose duties are to give their aid to the government in all matters required in these bases, and others upon which it shall be proper to consult them. It is their privilege, moreover, to propose to the government all regulations and systems they may deem necessary for the public good in every branch of the administration.

The *judicial power* of the country is vested in a supreme court, in departmental tribunals, and others already established by law. There is to be a perpetual court martial, chosen by the president.

The *Government of the Departments* is regulated by the seventh title.

Each department is to have an assembly composed of not more than eleven, nor less than seven, who must be twenty-five years of age, and possessed of the qualifications required for a deputy to congress. Their term of office is four years.

The powers of these assemblies are very simple and irresponsible, and scarcely amount to more than a species of municipal police, the whole of which is subject to the review of the president of the republic, and of a governor appointed by the president.

Electoral Power.—The population of Mexico is divided into sections of 500 inhabitants for the election of primary juntas, and the citizens to vote, by ticket, for one elector for every 500 inhabitants. These primary electors will name the secondary, who are to form the *electoral college* of the department in the ratio of one secondary elector for every twenty of the primary. This electoral college, again, will elect the deputies to congress, and the members of the departmental assembly; and its members must have an income qualification of at least five hundred dollars per annum.

On the 1st of November of the year previous to the expiration of the presidential term, each departmental assembly, by a majority of votes, or, in case of a tie, by lot, will select a person as president for the succeeding five years. There is no clause in the instrument limiting the term or terms for which an individual may be elected, or prescribing a mode of supplying the vacancy occasioned by his death, resignation, or incompetency.

Mr. Mayer observes, "The people are divided into classes of citizens and inhabitants. Property qualifications are created, while domestic servants, and the clergy, are disfranchised in the same category with gamblers and drunkards, though they possess both the required income and education.

"The opinion of the people is not to be taken directly by vote in regard to the men who are to represent them in the departments and in congress, or to govern them in the presidency; but their sentiments are to be filtered through three bodies of electors before their representation is finally effected. And, last of all, the supreme power is vested in a central government, while the people are left with scarce a shadow of authority over their homes and interests in the departments.

"It will be at once observed, that the President Santa Anna has thus succeeded in enforcing his favourite scheme of centralism.

"The four millions of Mexican Indians (scarcely one of whom ever had an annual income of 200 dollars in his life), must always be unrepresented in the government. No hope is proposed to them of advancement or regeneration; while the chief magistrate, himself, is surrounded by a complicated machine, that wants every element of democratic simplicity, and possesses a thousand inlets to corruption and mismanagement.

"In either event, the president may deem himself safe. If the bases succeed in giving peace, progress, and prosperity to Mexico, he will have the honour of the movement. But if he finds that they are not efficacious, or are likely to injure his schemes, it will be a task neither of difficulty nor danger, in so complicated a maze, to loosen some trifling screw, or throw some petty wheel from its axle, by which the whole must be disarranged without the responsibility of even its humblest engineers.

"So long as the president rules under an instrument which gives him complete control of the army, the power to declare war, entire patronage of the civil list, the right to impose fines, veto laws, and interfere with the judiciary;—he will possess an authority too great to be intrusted to any one individual in our day and generation."

Since the institution of this central system, Santa Anna has been banished, another president elected—insurrections have succeeded insurrections—*Pronunciamientos* and the Presidentship of *Paredes*, and a war with the United States, are among the events of the year 1846.

CHAPTER XXX.

REFLECTIONS ON THE PRESENT CONDITION AND PROSPECTS OF MEXICO.

It will appear evident, from the foregoing sketches of the various countries north and south of this vast region, that Mexico, with the most fertile resources and with all climates, soils, and productions, with magnificent forests,—with the precious, and most of the useful minerals, in abundance, is a powerless and declining state.

Spain, from the first day of occupation, planted in this physically highly-favoured empire, the elements of future weakness, dissolution, and decay. Arbitrary civil and military power,—injustice and cruelty to the aborigines,—and an ecclesiastical hierarchy, which fascinated the senses and paralyzed the intellect, were the elements of Spanish policy in America. No sound reasoner, who studied human character,—no statesman, who judged of the present, in accordance with the conduct of mankind in all countries—in all past ages, could have expected that a whole people born and brought up under such a government, and under such a church, would, on becoming independent of Spain, be prepared for civil liberty, for self-government,—and especially for a republican government, when the only religion they professed and tolerated was thoroughly anti-republican,—in all its institutions,—in all its observances,—and in its doctrines of passive obedience.

In other Catholic countries, as in France and in many parts of Germany, the circumstances were widely different. The inhabitants, at least those of the towns, and the prominent men in the country, were and are intelligent, and liberally educated. The people of Mexico had scarcely any other education, but the ceremonies of the church: which, being far above their comprehension, were mysterious, yet agreeable to them. The people were taught to perform their devotions with mechanical exactitude, and the priestly and monkish injunctions have been, since the days of Cortez, obeyed with unquestionable non-resistance.

The ecclesiastical power exacted and obtained obedience, but only to the church. The ignorance of the people in the arts, sciences, and all administrative principles, is, no doubt, greatly attributable, to the Spanish government;—but the sin of ignorance in the people, and intolerance in religion, is, in the most absolute sense, chargeable to the church.* This church is still rich almost be-

* See State of Education and Religion in Mexico hereafter.

yond precedent in Mexico. Ecclesiastical property is sacred. It has been invaded, almost utterly despoiled, in Spain; but amidst all the anarchy which has disturbed the country, the lands, and the treasures, of churches have been held in holy reverence in Mexico.

A standing army of great numerical organisation, consisting of mixed breeds of all shades of colour and character, without either patriotic or chivalrous spirit, has been maintained at ruinous expense to the country ever since Mexico became independent of Spain. This force, which, morally speaking, is little superior to numerous hordes of bandits, has served each military adventurer who has been successful in the declaration of a *pronunciamiento*.*

With respect to the civil power, in Mexico, the incapacity for self-government, or rather the impatience of that control, which must be submitted to in order to enjoy civil and religious liberty, can only be attributed to the most remarkable prevalence of ignorance,—to the evils which the ancient government engendered,—and to the jealousy which one individual entertains of any other attaining power under the modern administration. Under other circumstances we believe that Iturbide would have been, in his general government, a fitting ruler for the country. With no very exalted opinion of Santa Anna as an administrator, we believe there might have been less dangerous presidents elected in the most advanced of republics.

In Europe we have in another work drawn a parallel between the prosperous and powerful condition of Holland, and the distracted and feeble state of Spain.† In America we may well contrast one small community, that of Massachusetts, with a vast empire,—that of Mexico. One hundred years after the date, when the great epoch of Spanish power sent forth Cortez and his followers, to conquer and possess, the most magnificent, populous, fruitful, and rich empire in America, a few persecuted pilgrims landed in, naturally, the most forbidding and savage regions of the territory now included in the Anglo-American union. Indomitable energy, rigid virtue, habits of thrift, the most laborious perseverance, and the spirit of civil and religious liberty, have gradually transformed a country of rocks and wilds, with a severe and boisterous climate, into one of the most prosperous, happy, populous, and intelligent states in the world. In truth one may behold more of the spirit of industry and enterprise on a frozen lake in Massachusetts, than in the vast fertile plain, amidst which the city of Mexico stands. In New England, if a public question affect the interests of the people, they meet and discuss it gravely at a preliminary, or *caucas* meeting. Each citizen retires in the evening calmly to within the circle of his domestic enjoyments, and on the following morning attends to the duties of his farm, or of his trade, or profession. Such have been, with the early education of her people, some of

* See Armed Force of Mexico hereafter.

† See Commercial Statistics, vols. i. and ii.

the leading causes which has made Massachusetts a great agricultural, manufacturing, fishing, maritime, and commercial commonwealth.

But in Mexico revolution has succeeded revolution. The states of the federal government are not only divided from the central administration,—but they have their local revolutions and rapid change of rulers.* In all, the elements of discord appear to be effectually working towards dismemberment and decay, and to be preparing for the mastery of a mighty power,—energetic, irresistible, and progressive in its origin, in its growth, and in its character. The epoch destined for this great advent, may not arrive within the period of half an age,—but it requires no uncommon forecast of the future progress of an enterprising, intelligent, and bold race, to fix the date, which will replace Spanish American misrule, by an Anglo-Saxon power,—and substitute for the Spanish language, and an absolute Roman Catholic hierarchy, an English tongue, and practical, civil, and religious liberty.

TEXAS is, *de facto* and *de jure*, Anglo-Saxon-American. CALIFORNIA is now, in power and in occupation, an Anglo-Saxon-American country. YUCATAN is not only independent, but, with all the jealousy of the 500,000 to 600,000 inhabitants of that country towards strangers, they have already solicited protection from Anglo-Saxons, whether from the United Kingdom, or from the United States of Anglo-America.

Eighty-six years ago, there did not live a stationary inhabitant who spoke the English language, from the mouth of the Gulf and River of St. Lawrence to the mouth of the Columbia—from the Lakes of Canada to the Gulf of Mexico—from the Alleghany Mountains to the Pacific. The English language was confined to the old Atlantic provinces lying east of the Alleghanies, and from some few spots, in Nova Scotia and Maine, to South Carolina. It has been chiefly within the last fifty years that the progress of the English language has advanced, with the exception of Mexico (which it has also most extensively invaded), over the whole of North America from the frozen region, to the Mexican Gulf—from the Atlantic to the Pacific. Its progress has been infinitely more rapid than the conquests of the Romans, or the descents of the Goths, Huns, and Vandals.

In marking this progress, we are not justifying all the circumstances of its past, or its probable future, march. We judge from the events of the past in

* In a communication dated the city of Mexico, 29th of June, 1846, it is stated that “Mazatlan, Guadalajara, Acapulco, Sinaloa, and Sonora have declared against the government. On the 26th inst. an express arrived from Tepic, announcing that a convention had been held in Santa Barbara, on the Californian coast, in which the Californias declared themselves sovereign and independent states, renouncing their connexion with Mexico. In the south, although General Alvarez has received a temporary check, he was still roaming about with a disorganised band of lawless adventurers, committing excesses of the most horrible nature. To sum up the melancholy catalogue, the *Indians*, alive to the general disorganisation, are ravaging the northern provinces with fire and slaughter, and only so lately as the 7th instant Durango attacked and killed a company of cavalry, and filled the adjacent villages with well-founded fears for their lives and property.”

forming our anticipations of the forthcoming. Even if the government of the United States should endeavour to bring the present warfare to a speedy termination,—and, without further annexation of any part of the Mexican territories, we are persuaded that the advances of private individuals, independently of the government, will gradually, if not rapidly, establish Anglo-Saxon rule over the regions, where the Aztecs yet predominate in numbers,—where the Spanish race still misrule,—regions which once formed the empire of the Moctezumas.

CHAPTER XXXI.

STATISTICS OF MEXICO.

THE statistics of this magnificent country, from the anarchy which has prevailed since its independence of Spanish authority, are very deficient and uncertain. Official accounts are either not completed, or they are not made known to the public; unless it be in the form of vague statements. From estimates obtained by Mr. Ward, and the British, American, and French consuls—by Mr. Mayer, and by the Baron Von Humboldt, we have been enabled to compile the following statements :—

POPULATION.—The number of inhabitants in Mexico is not even approximately known: we have, in a former page, given the various estimates as collected by Mr. Mayer, viz:—7,015,509 inhabitants, about 1,000,000 of which were estimated of pure European race; 4,000,000 of aboriginal race; 2,000,000 of mixed breeds, and 6000 negroes.

Recent accounts do not correspond with the statements of Humboldt: for the increase of the population, since the independence of Mexico, is far from proportionate to his statements of the rapid increase during the thirty years previous to the period when he visited the country. The registry of the births and burials were then, he informs us, kept in many places with great accuracy by the parish clergy, whose emoluments depend somewhat on baptisms and funerals. Through the archbishop of Mexico, Humboldt had free access to these collections. The proportion of births to deaths throughout the kingdom was as 170 to 100; in some parts of the table-land of Mexico the proportion was as high as 253 to 100; but at Panuco, on the coast of the North Sea, it was as low as 123 to 100; this difference arose from the great salubrity of the table-land compared with the low, marshy lands upon the coast. He remarks that the salubrity of tropical climates depends more on the dryness of the air than its other sensible qualities. The burning province of Cumana—the coast of Coro—and the plains of Caracas, prove that excessive heat alone is not unfavourable to human life; that

in very hot, but dry countries, mankind attain to a greater age than in the temperate zones. Humboldt says, while he was at Lima—

“A Peruvian Indian died at the age of 147; having been married for ninety years to the same woman, who had lived to the age of 117; till he attained to the age of 130, this venerable personage used to walk three or four leagues every day, but for the last twelve years of his life he had lost his sight. Many instances of similar longevity are related in the *Mercuri Peruano*.”

“The table-land of Mexico, which constitutes three-fifths of the kingdom, enjoys not only a dry and light a mosphere, but a mild and temperate climate; the winters are as gentle as at Naples; the medium temperature of that season is from 13 deg. to 14 deg. of the centigrade thermometer: sometimes, indeed, though rarely, the thermometer descends below the freezing point; but in the greatest heat of summer it never rises in the shade above 24 deg. On the coast the medium temperature of the whole year is, on the contrary, about 25deg. or 26 deg.; and wherever the air is moist as well as hot, the climate is exceedingly unwholesome; this is the case upon the north coast of Mexico, from the mouth of the river Alvarado to the river Tampico, and plains of the New Santander; and the south coast is equally unhealthy, from San Blas to Acapulco. The combination of heat and moisture in the atmosphere, in like manner, renders the coast of Caracas unwholesome, from New Barcelona to Puerto Caballo.”—*Thompson's Alcedo*.

The population of the whole viceroyalty of Mexico, as calculated in 1703 by the census ordered by Revillagigedo, viceroy of the kingdom, amounted at that time to 4,483,559 souls, and in 1808 Von Humboldt says the population was 7,800,000. From an examination of the registers of different parishes, he estimates the proportion of births to the whole population as one to 17, and that of deaths as 1 to 30; and he finds the number of male births to be greater than that of females, in the proportion of 100 to 97, which is somewhat less than the proportion observed in France. At this rate of increase Mexico should now be as populous as the United States, instead of being estimated at less than in 1808.* The *data* on which M. Von Humboldt calculated were most assuredly of no value. He informs us also that—

“The tithes, which are collected from all sorts of agricultural produce, have doubled in their amount in twenty-four years, and he describes the general face of the country

* Mr. Waddy Thompson, lately American minister at Mexico, says—“My own observation would lead me to believe that the number of mulattoes is very small. I am sure that I never saw half a dozen in the city of Mexico, and the African blood is, I think, easily detected. The appearance of the mulattoes is almost as distinct from the Indian as it is from the white man; there is a manifest difference even in colour. Of the number of Mestizoes, descendants of the Indian and white races, it is impossible to form even a conjecture with any approach to accuracy. As the cross partakes more or less of either of the races, it is difficult to say whether the individual is of pure or mixed blood. When the Indian cross is remote, it is difficult to distinguish the person from a swarthy Spaniard, and so *vice versa*. Neither do I think that there are many Zambos, for the African blood shows itself as distinctly in the cross with the Indian as with the white man. I have never looked upon any colour so horribly revolting as that of the Zambo. Many of the inhabitants of the Pacific coast are very dark, as dark as brown negroes, and darker than mulattoes, but have none of the physical or physiognomical peculiarities of the negro. They are tall, well-formed, fine-looking men, with limbs and faces much more Grecian than African. If I were to form an opinion of what I saw, I should say that the estimate of white persons is a large one. They are much confined to the cities, and a few wealthy proprietors, who reside upon their estates. I am quite sure that nine of every ten persons whom one meets in the streets of Mexico are Indians or Mestizoes, and it is in that city that the white population is greater in proportion than anywhere else; in travelling in the country it would be safe to wager that forty-nine of every fifty persons you might meet would be Indians. I have heretofore spoken of the sympathy of race,

as indicating the rapid progress and extension of its agriculture. Fields brought recently into cultivation, country-houses building or lately erected, populous, rising, and industrious villages, are the objects which meet the eye of the traveller in every direction in which he crosses the country."

"Another indication of the growing prosperity of Mexico," says Von Humboldt, "was the productiveness of the taxes levied on its internal trade and consumption. The duty of *alcabala* in the kingdom of Nueva Espana, which from 1766 to 1778 inclusive, yielded only 19,844,054 dollars, produced in the same number of years, from 1772 to 1791 inclusive, 34,218,463½ dollars; making a difference in favour of the second period of 14,374,409. The *alcabala* was an oppressive tax of six per cent on all commodities sold in the interior of the country, and exacted as often as the sale is repeated. Its productiveness was consequently the best indication possible of the prosperity of internal trade."

We have great respect for M. Von Humboldt, but the above remarks would incline us to conclude that he would have made a meagre commercial minister.

RELIGION AND ECCLESIASTICAL ESTABLISHMENTS.

The Roman Catholic faith is the only religion publicly tolerated by the constitution of Mexico; other religions, but not places of worship, are merely allowed by sufferance. The church establishment has remained much the same as under Spain. The hierarchy consists of the Archbishop of Mexico, nine bishops, and from three to five thousand parish priests. There are ten cathedrals with innumerable canons and many other dignitaries. There are nearly 2000 monks, and more than 150 convents. Church property neither paid under Spain, nor since the revolution, any state burden or tax. The priests and monks have the sole distribution of all money bequeathed for charitable or pious uses. The old Spanish monks and priests were banished during the revolution, their places, like civil offices, were filled by creoles.

Mr. Mayer, in his work on Mexico, regrets his want of an accurate account of convents, property, numbers, and wealth of the religious orders in 1842.

The want of a general work of reference on statistics is denounced, as "shameful and lamentable," by Senor Otero in his treatise on the social and political condition of Mexico. "In 1842," says this writer, "we possess no publication upon Mexican statistics except the work of Baron Humboldt, written in 1804. That work, precious as it is, has become useless as a guide, in consequence of the immense changes during the intervention of a long and revolutionary period. A complete statistical treatise might be easily compiled without expense to the National Treasury, by merely obliging the functionaries of the government to make regular and minute returns, which should be digested and edited by competent persons in the capital. Without such a work it will be impossible to understand the complicated interests of this vast country, or to keep the machinery of its government in successful operation."*

Mr. Mayer says: "Of all branches of the national administration, none has suf-

but it is not half so strong as the antipathy of race. The feelings of the Indians of Mexico towards the Spaniards is very much the same now that it was at the period of the Conquest. Although every thing admonishes them that the European is the superior race, they are generally averse to alliances with them, and whenever such are formed, they are prompted more by interest than inclination."

* Otero, *Cuestion Social y Politica*, p. 30—31.

ferred more obscurity by this diplomatic rhetoric than the question of the Church, which properly belonged to the portfolio of the Minister of Public Justice and Instruction. It was a subject that men seemed fearful to approach. They admitted that there were abuses in the body;—that many of its members were corrupt, idle, ignorant, and vicious;—and that it enjoyed large revenues, flowing in a narrow stream, which, if suffered to diverge into smaller rivulets, would nourish the parched land and improve the condition of suffering multitudes. *But wealth and property were banned and sanctified.* The ESTABLISHMENT was the RELIGION; and he who ventured to assail the one must necessarily attack the other. Thus, even patriots who were not ordinarily affected by nervous dread, stood appalled at the first frown of priestly indignation; and trembled for their fate in a conflict between the temporal power and that tremendous spiritual influence which slept like an electric fire in the hearts of the people, ready, on the slightest impulse to be kindled into a destructive flame.*

"It would be unjust, however, to leave you under the impression that the ministers of this church have been solely engaged in enriching themselves, and scandalising the cause of true faith, as has been so often proclaimed by European travellers. Although many of them are unworthy persons, and notwithstanding their rites and ceremonies are often rather accommodated to a population scarcely emerged from the forests, than to intellectual man;—yet the wealth of the church has not been at all times devoted to base and sordid purposes, or used to corrupt its possessors and the people. Throughout the republic no persons have been more universally the agents of charity and the ministers of mercy, than the rural clergy. The village *curas* are the advisers, the friends and protectors of their flocks. Their houses have been the hospitable retreats of every traveller.* Upon all occasions they have constituted themselves the defenders of the Indians, and contributed toward the maintenance of institutions of benevolence. They have interposed in all attempts at persecution, and wherever the people were menaced with injustice, stood forth the champions of their outraged rights. To this class, however, the wealth of the church was of small import.

"These virtues and devotion have served to fix the whole priesthood deeply in the hearts of the masses, and to attach the poor to their persons and enlist them in defence of their property. The priest, the creed, the church and its revenues, seemed to be *one and indivisible* in the notions of the people; and in turn, the priesthood became jealous and watchful of the power which this very affection had created. Avarice was not wanting to increase their gains from dying penitents, pious bequests, holy offerings and lavish endowments. And thus (often grossly human while humbly good), they have contrived, upon the same altar, to serve God and Mammon.

"It is now quite natural, that they should desire to preserve the property which has been collected during so many years of religious toil and avaricious saving, and they dread the advance of that intellectual march which, in the course of time, will consign their monastic establishments to the fate of those of England and Spain. The combination of large estates, both real and personal, in the hands of a united class acting by spiritual influence, under the direction of one head, must be powerful in any country, but certainly is most to be dreaded in a republic, where secret ecclesiastical influence is added to the natural control of extraordinary wealth.

"It is difficult to say with accuracy, for the reasons I have already assigned, what this wealth at present is,—but I think the number of convents, devoted to about 2000 NUNS in the republic is fifty-eight; for the support of which (in addition to a floating capital of rather more than *four millions and a half*, with an income therefrom of 250,000 dollars), they possess some 1700 estates or properties, producing an annual revenue of about 560,000 dollars.

"There are about 3500 SECULAR CLERGYMEN and 1700 MONKS.

"The *latter* possess 150 conventual establishments, and divided as follows: Dominicans, 25; Franciscans, 68; Augustines, 22; Carmelites, 16; Mercedarios 19—total

* These observations as to the village *curas* are analogous to what we have witnessed as characteristic of the most exemplary priests we have ever known—the Catholic *curés* in the central parishes of Lower Canada.—See Mac Gregor's *British America*.

150. The number of nuns, 2000; of monks, 1700; of secular clergy, 3500—total 7200. A number certainly inadequate to the spiritual wants of a population of 7,000,000, and yet too small to be proprietors of estates worth at least 90,000,000 of dollars, according to the annexed valuation.

	dollars.
Real property in town and country	18,000,000
Churches, houses, convents, curates, dwellings, furniture, <i>jewels</i> , precious vessels, &c	52,000,000
Floating capital—together with other funds—and the capital required to produce the sum received by them annually in alms	20,000,000
Total	90,000,000

"The real property is estimated to have been worth at least twenty-five per cent more previous to the revolution, and, to this enhanced value must be added about 115,000,000 dollars of capital, founded on '*contribuciones*' and '*derechos reales*,' to imposts to which they were entitled, on the property of the country.*

"The value of their churches, the extent of their city property, the power they possess as *lenders*, and the quantity of jewels, precious vessels, and golden ornaments, will raise the above statement, I am confident, to nearer 100,000,000 dollars than ninety, or to a sum about *eighty-eight millions less* than it was before the outbreak of the war of independence; at which period, the number of ecclesiastics is estimated to have been 10,000 or 13,000, including the lay-brotherhood and the subordinates of the church."

During the royal government it was the policy of the Spanish cabinet to cherish the temporalities of the Mexican church. The mayorazgos, or rights of primogeniture, forced, as in Spain, the younger sons either into the profession of arms or of religion; and it was resolved that ample provision should be made for them. All the lucrative benefices came into the hands of the crown or the hierarchy, and the greater number of the elevated ecclesiastics were men of high birth.

The rights of primogeniture having been abolished in the republic, the power to collect *tithes* by compulsion is also abrogated. The church has become odious in the upper classes *as a means of maintenance*, and its members now belong to the humbler classes. But wealth and superstition has preserved for it a powerful influence over ignorance.

It is remarkable that the army has become equally unpopular with the upper class of Mexicans as a profession; its command is generally intrusted to men who have arisen from the people. Both the church and army sustain each other against the aristocracy of landed proprietors, who chiefly live retired.

Mr. Mayer, however, observes: "The government, pressed by its wants, is beginning to encroach gradually on its resources, and within the last two years has appropriated parts of the real estates of the clergy to replenish an empty treasury. That such is an honest and patriotic devotion of ecclesiastical means, no one can deny, and the doctrine is sustained by legal writers of the highest authority.† The church has no

* *Vide* Otero, p. 38, 39, 43.

† *Vide* Vattel, book I, chap. xii. sec. 152.

"The state," says this high legal authority, "has unquestionably the power to exempt the property of the church from all imposts, when that property is not more than adequate to the support of the ecclesiastics. But the priesthood has no right to this favour except by the authority of the state, which has always the right to revoke it when the public good requires. One of the fundamental and essential laws of society is, that on all occasions of need the goods of all its members ought to contribute proportionably to the wants of the community. Even the prince himself cannot, by his authority, grant an entire exemption to a numerous and wealthy body of persons, without committing an extreme injustice to the rest of his subjects, upon whom the burden would altogether fall by this exemption."

Mr. Mayer follows Vattel, by saying, "Far from the goods of the church being exempted because they are consecrated to God,—it is for that very reason that they should be the first taken for the welfare of the state. There is nothing more agreeable to the Common Father of men

need of possessions, except for the purposes of beneficence and charity. The vow of its members is for chastity and poverty. It receives only to become an *almoner* for more extensive benevolence. And as the state in the hour of need, must ever be the chief pauper, she has an unquestioned right to call upon the ministers of God, in the spirit of the religion they teach, to open their coffers freely for the public good. With its 90,000,000 or 100,000,000 of property and money, it might extinguish the national debt of 84,000,000, and still leave an ample support for its 7000 members, or, at least, for its secular clergy, who would be cherished and sustained more liberally by the masses for an act of such Christian sacrifice and benevolence."

Mr. Waddy Thompson, late United States' Minister in Mexico, observes :—

"There is another and equally indispensable reform which I have little hope will be made—the curtailment of the revenues and the power of the priesthood, and *the free toleration of all religions*. Without this I have no hope whatever for the country. When Charles I. of England visited Spain he said that he had never liked the Catholic religion, but that he had never detested it until he had visited a Catholic country. I do not choose to say that, but I will say that the prevalence of that religion to the *exclusion* of all others, and the power of the priesthood as it exists in Mexico, are, in my judgment, incompatible with a Republican form of government. Wherever such a state of things exists there is a power behind the throne greater than the throne. The more ignorant the people, the greater is this power, and hence the opposition of the Catholic priesthood in other countries than Mexico to the diffusion of knowledge. I have not visited any other Catholic country, but in Mexico the subjection of fortune, mind, and body to an ignorant and licentious priesthood, is a crying and a burning shame. But, to say nothing of any thing else, *the impositions levied by the church, in one form or other, are more than the country can bear*. It may be that no administration will be strong enough to cope with the priesthood. It is said that Santa Anna tried it and was forced to yield. If this be so, they might as well abandon at once all hope of free institutions. The two things cannot exist together; they never have, and they never will."

EDUCATION.

Of the total population, it was estimated that only 687,748 could read—including women and children.* Of the male population, Mr. Mayer considers that not more than 100,000 can read and write; and then observes ;—

"We will no longer be surprised that a population of more than seven millions has hitherto been controlled by a handful of men. In addition to this, you will observe

than to preserve a nation from destruction. As God has no need of property, the consecration of goods to Him, is their devotion to such usages as are pleasant to him. Besides, the property of the church, by the confession of the clergy themselves, is chiefly destined for the poor. Now, when the state is in want, it is, doubtless, the first pauper and the worthiest of succour. We may extend this reasoning to the most ordinary cases, and say, that to impose a part of the current expenses on the church property in order to relieve the people to that extent, is really to give those goods to the poor, according to the spirit of their original destination."

* "In fact," says M. Chevalier, "elementary instruction has remained what it was in the time of the Spaniards. The clergy had then the exclusive management of it, and having so still, show but little inclination to enable the poor to read the books published under the régime of a free press. There are even fewer schools than there were, in consequence of the diminution in the number of the clergy. Education of a superior kind is even worse provided for. Under the Spaniards there existed at Mexico a school for the fine arts, richly endowed : I have been unable to discover its existence now. There is a building called a museum, where I found nothing of interest except a collection of the portraits of the viceroys since the time of Cortez, and a few Azteque manuscripts. Some years ago the establishment of a polytechnic school was decreed, but the decree has yet to see the commencement of its execution. There is not even a military school, though the attention of the government is almost exclusively devoted to the army. There is nothing deserving the name of a school of law or medicine ; and it may be well imagined that schools of industry or commerce are wholly unknown."

how little has been done hitherto for the cause of learning by the government, when you examine a table of the expenses of the nation, by which it will be seen, that in the year 1840, while 180,000 dollars were spent for hospitals, fortresses, and prisons, and 8,000,000 dollars for the army (without a foreign war!), only 110,000 dollars were given to all the institutions of learning in Mexico.*

Mr. Mayer's further remarks are, however, more consolatory. He says, "I learn, however, with pleasure, that under the new scheme of national regeneration which has recently been put in action, the subject of education has engaged the especial attention of the existing powers, and that they design to foster it by every means in their power.

"In every one of the parishes into which the city of Mexico is divided, there is established a school for boys, and another for girls, supported by the *Ayuntamiento*, or town council. In these establishments the pupils are taught, without charge, to read, write, and calculate, and are besides instructed in religious and political catechisms. In the schools for girls, in addition to these branches, they learn sewing and other occupations suitable for their sex. Books and stationery are furnished gratis.

"There is another establishment called the Normal School, supported by the government, and devoted to the instruction of the soldiers of the army in the rudiments of learning. Advancement and improvement in this school are suitably rewarded by ranks in the army. Besides this, there is, also, a *Lancasterian company*, which, commencing its labours in the capital, is spreading its branches all over the country. It is devoted to primary instruction, and is protected by all the citizens of the republic who are remarkable either for their wealth, education, or social position. The contribution is a dollar monthly. I am glad to learn that, since I left Mexico, the usefulness of this company has been so apparent to the people, that schools upon its plan have not only been established in the principal cities and towns, but that they are now being founded in almost every village of importance, and even upon extensive haciendas or plantations, where the labouring population is numerous and ignorant.

"In the city of Mexico this company has formed a large number of schools for children of both sexes, upon the same footing as those established by the *Ayuntamiento*; that is to say, the pupils are taught without charge, and are furnished with the requisite stationery and books. There is a night school for adults, very fully attended by citizens, whose occupation prevents them from devoting themselves to study during the day. In the women's and men's prisons, and in the house of correction for juvenile delinquents, I also learn that schools have been formed; and it is by no means a cheerless feature in this picture of dawning improvement, that the ladies of Mexico, most distinguished by talent, wealth, and cultivation, have gladly availed themselves of the opportunity to devote a portion of their time for the purpose of instructing their unfortunate sisters in the prisons.

"Besides these establishments (which are all of a free and public character), it is difficult to give any idea of the number of private schools for both sexes in the capital and departments. Many of them are conducted by foreigners as well as Mexicans, and although they generally instruct in French, English, grammar, reading, writing, arithmetic, geography, the rudiments of history, book-keeping, drawing, and music, I have reason to believe that none of them are remarkable for the regularity or perfection of their system.

"In the city of Mexico there are the collegiate establishments of El Seminario Conciliar, San Ildefonso, San Gregorio, and San Juan Lateran. The first of these is under the immediate supervision of the archbishop, and supported by a portion of the ecclesiastical revenues. The other three are under the care of the government. In almost all

* The United States census for 1840 gives the following results;—

Number of universities and colleges	173	Scholars at public charge	468,264
" of students in ditto	16,293	Total number of whites in the	
Academies and grammar schools	3,242	United States	14,189,108
Students in ditto	164,159	Total number of whites in the	
Primary common schools	47,209	United States over the age of 20	
Scholars in ditto	1,845,244	who cannot read and write	549,693

the departments of the republic, there are collegiate institutes, and in some, even two or three.

"The course of instruction in these establishments is alleged to be thorough and modern. The students, who live within the walls, are expected to contribute for their education, while others, who only attend the lectures of the professors, are exempt from all costs and charges, so that about two-thirds of the pupils of every college receive their literary education gratuitously.

"The regeneration of Mexico lies in her schools. Without their success she must not expect to drive *léperos* from the streets, or usurping dictators from the palace of her ancient kings."

Mr. Thompson speaks rather more favourably of the progress of common instruction. He says "he had not a servant when he was in Mexico who could not read and write—not very well, it is true;" and he continues—"I often observed the most *ragged leperos*, as they walked down the streets, read the signboards over the store doors. How this happens I know not, unless it be the effect of Lancasterian schools, which are established all over the country, chiefly, I think, through the instrumentality and exertions of General Tornel—a noble charity, which should of itself cover a multitude of sins much greater than those which even his enemies impute to him."—*Recollections of Mexico. New York, 1846.*

When Mr. Mayer wrote there were forty-four newspapers in the republic.

CHAPTER XXXII.

REVENUE AND EXPENDITURE OF MEXICO.

THE public revenue of a state, if equal to its necessary expenditure, and if equitably levied, constitutes not only the great element of the power and permanency of government, but of the steady industrial and moral condition of the people. The distribution, levying, and proceeds of the taxes,—the expenditure of the revenue,—and the maintenance of public credit in Mexico unfortunately does no honour to the wisdom of the different administrations, nor to the intelligence of those who in the legislative assemblies have passed laws for raising a public revenue. Of several statements, the following, drawn up by Mr. Mayer, is that which seems, approximately, the most correct:—

"The income of the Mexican government is derived from revenues on foreign commerce, imposts on internal trade, imposts on *pulqué*, export duty on the precious metals, lotteries, post-office, stamped paper, taxes, tobacco, powder, salt-works, and several other sources of trifling importance.

"The amount of the revenue of Mexico at different dates has been given as follows:—

Y E A R S.	Revenue.	Y E A R S.	Revenue.
	dollars.		dollars.
1700.....	3,000,000	1827.....	10,494,299
1753.....	5,705,876	1828.....	12,232,385
1790.....	15,010,974	1829.....	14,493,189
1802.....	26,200,000	1830.....	18,923,299
1825.....	10,690,602	1831.....	16,413,060
1826.....	13,289,682		

"In 1840, these revenues are stated in the report of the minister of the treasury as follows :—

FOREIGN COMMERCE, &c.	Nett Proceeds after deducting Expense of Collection.	FOREIGN COMMERCE, &c.	Nett Proceeds after deducting Expense of Collection.
	dollars.		dollars.
Imposto on foreign commerce.....	7,115,849	Brought forward.....	12,199,586
" on interior ".....	4,366,585	Enteros de productos liquidos.....	452,146
" on property, income, &c.....	466,061	Extraordinary subsidy.....	103
Exchanges, &c.....	307,427	Arbitrio extraordinario.....	78,177
Creditos activos.....	3,309	Capitacion.....	483
Balances of accounts.....	355	Donations.....	13,662
Carried forward.....	12,199,586	Total.....	12,744,157

"In 1839 the revenues amounted to 11,215,848 dollars. The income from the post-office department (which is not included in the statement for 1840), was 178,738 dollars in 1839. In 1840 the lotteries produced the gross sum of 215,437 dollars, but as the expenses connected with their management amounted to 158,485 dollars, it left a balance of but 56,952 dollars for the government. The '*sealed paper*,' or stamp-tax produced 110,863 dollars, but as this impost has been nearly doubled during 1842, the revenue must at present be proportionally greater.

"I have been unable to obtain any of the official documents of 1841 and 1842 (in consequence of the disturbed condition of the country), with the exception of the following custom-house returns for the former year.

CUSTOM-HOUSES.		Tonnage Duty.	Nett Proceeds after deducting Costs of Collection.
		dollars.	dollars.
East coast..	Vera Cruz.....	31,032	3,374,528
	Tampico.....	7,363	1,019,046
	Matamoras.....	3,525	279,627
	Mazatlan.....	6,245	397,213
West coast..	Guyamas.....	2,092	46,189
	Monterey.....	810	85,982
	Acapulco.....	573	7,193
	San Blas.....	2,719	190,270
Total.....		55,259	5,399,948

"It will be perceived that the custom houses of Tabasco, Campeachy, Sisal, Isla de Carmen, and Bacalar, are not included in the preceding statement in consequence of the separation of the first (during the period) from her allegiance to the republic, and on account of the rebellious condition of the rest. At the date of the statement, reports from Goatzacoalco, Alvarado, Tuxpan, Huatulco, Manzanillo, La Paz, Pueblo Viejo, Altata, Loreto, San Diego, San Francisco, Soto la Marina, and from the frontier posts of Paso del Norte, Comitan, Tonalá, Santa Fé de N. Mexico, y Presidio del Norte, had not been yet received at the treasury office in the capital. The costs of the collection of this revenue amounted to 52,886 dollars, and the salaries of officers to 295,404 dollars.

SMUGGLING.—"No one who has resided any length of time in Mexico, either connected or unconnected with commerce, can fail to have heard of the extent to which smuggling has been and still is carried on in the republic. This infamous system, alike destructive of private morals and public integrity, has become a regular business in portions of the country, and, after having been, to a great extent, suppressed on the eastern coast, has for several years occupied the attention of numbers on the west. Mr. M'Clure calculated that the republic possesses "a frontier of five thousand miles, including the sinuosities, windings, and turnings of bays, gulfs, and rivers on the Pacific; three thousand miles on the United States of America and Texas; and above two thousand five hundred on the Gulf of Mexico; making, in all, ten thousand five hundred miles; of frontier to guard against illicit trade, *without an individual on the one thousand two hundredth part of the space to give notice of any depredations that may happen.*"

Mr. Mayer observes,—"That wherever there are smugglers to *introduce* it is probable that there are individuals to *receive*, and consequently that the government, *might* be pro

tested; still it is undeniable that the territory is vast, the population sparse, and the corruption of government agents has been as shameful as it was notorious. Facts came to my knowledge while a resident in Mexico, which proved beyond question, this immoral tampering, and went far to implicate men of rank and capacity in the country. I forbear to detail these occurrences here, but I have the documents in writing, under the attestation of an individual who was approached by one of the vile instruments in the deed of shame, and I feel perfectly satisfied of their unexaggerated accuracy. I do not mention this circumstance for the purpose of reflecting on the existing government, but simply to direct the attention of such Mexicans as may read these letters to a frightful evil, the extirpation of which will at once increase the financial resources of the country and improve the morals of their people. It may be urged, perhaps, that it is impossible to correct this maladministration; and, I confess, there appears to be much force in the remarks which I subjoin from the author I have just quoted. At page 292 of his 'Opinions,' Mr. McClure observes:

“‘In the comparatively limited frontiers and crowded population of the European monarchies, with their hundreds of thousands of soldiers and officers of the customs, it has been found impossible to prevent smuggling, with all its attendant crimes and corruptions. What hopes, then, can a small population scattered over so extensive a surface have that a revenue will be collected, even if it were probable in the present state of morals to find honest collectors! It would be contrary to all former experience and analogy, to expect any thing else in this country than a gradual diminution of the revenue, in the ratio of the organisation of smuggling. All additional guards or officers of the customs would certainly increase the quantity of bribery and corruption, but would not add to the revenue a sum equal to their pay.’”

NATIONAL DEBT AND FINANCES OF MEXICO.

The national debt of Mexico is one of very considerable importance, and may be divided into the two great classes of foreign and internal debt.

The internal debt amounts to 18,550,000 dollars; and in 1841 the customs were mortgaged to pay this sum, in the following subdivisions:—

INTERNAL DEBT.					Amount.
					dollars.
17	per cent of the customs devoted to a debt of.....				2,040,000
15	"	"	"	"	410,000
12	"	"	"	"	2,100,000
10	"	"	"	"	3,100,000
8	"	"	"	"	1,200,000
10	"	"	"	"	9,700,000
16½	"	"	"	tobacco fund debt.....	
10	"	"	"	interest on English debt..	
				garrison fund.....	
982					18,550,000
1½	balance clear of lien, for the government !				
1000					

The foreign debt is still larger than this; and (including the above), I will state the entire national responsibility, as it existed at the end of last year:—

FOREIGN DEBT.		Amount.
		dollars.
Internal debt.....		18,550,000
Debt to English creditors.....		60,000,000
United States claims and interest, say.....		2,400,000
Copper to be redeemed.....		2,000,000
Claims for Hilo.....		700,000
Bustamante loan.....		500,000
Total.....		84,150,000

Until 1841, the whole of the revenue, except 11½ per cent was appropriated to the payment of 18,550,000 dollars, while the remaining claims were entirely unprotected

by securities. Shortly after the accession of Santa Anna to power, he *suspended* (by a decree of the 16th of February) the payment of the first five funds charged upon the customs, as stated in a preceding table, but reserved the *active appropriation* for the tobacco and *English interest debts*. This, as may be well imagined, created great dissatisfaction among the mercantile classes, and among numbers of persons who had invested their capital in government loans, with a reliance upon the *revenues* as a solemn pledge for their redemption. Santa Anna, however, withstood the torrent manfully. He was assailed by legations, newspapers, and individuals, but nothing could induce him to yield the pressing wants of the government to their importunities. He was, in fact, forced to the measure. The national credit was irremediably impaired, and he found it impossible to obtain loans. The consequence was the seizure of the customs by the *suspension* of their prior appropriation until he was enabled to relieve his treasury.

PROSPECT OF PAYMENT OF THE DEBT OF MEXICO.

As to the prospect which may be held in view in regard to the payment of either interest or principal of this debt, we have little further to observe than that, in June this year, 1846, President General Parades tells the assembled legislative congress, that, however much convinced "that credit is the first element of power to a government, and reliance on its good faith the greatest resource of its strength, he had been reluctantly compelled to suspend provisionally the payments of government; an extreme measure, rendered, however, imperative to save the nation from ruin, a ruin that must have equally been shared by its self-same creditors; and, in conclusion, he urged congress to adopt some method of finance, capable of assisting him to carry on the war with vigour, and support the honour of the country."

Independently of the English and the American debt, the claims upon the Mexican government have usually been created by means of loans of the most usurious character.

On the 20th of September, fifteen days before the treaty of Estansuela, the administration of President Bustamente offered the following terms for a loan of 1,200,000 dollars. It proposed to receive the sum of 200,000 dollars in *cash*, and 1,000,000 dollars represented in the *paper or credits* of the government. These credits or paper were worth, in the market, nine per cent. About one-half of the loan was taken, and the parties obtained orders on the several maritime custom houses, receivable in payment of duties.

The revenues of the custom house of Matamoras have been always hitherto appropriated to pay the army on the northern frontier of the republic. During the administration of General Bustamente, the commandant of Matamoras issued bonds or drafts against that custom house for 150,000 dollars, receivable for all kinds of duties as cash. He disposed of these bonds to the merchants of that port for 100,000 dollars, and in addition to the *bonus* of 50,000 dollars, allowed them interest on the 100,000 dollars at the rate of three per cent per month, until they had duties to pay which they could extinguish by the drafts.

The mint at Guanajuato, or the right to coin at that place, was contracted for in 1842 by a foreign house in Mexico, for 71,000 dollars *cash*, for the term of *fourteen years*, at the same time that another offer was before the government, stipulating for the payment of 400,000 dollars for the same period, payable in annual instalments of 25,000 dollars each. The 71,000 dollars in hand were, however, deemed of more value than the prospective 400,000 dollars! This mint leaves a nett annual income of 60,000 dollars!

It appears to us quite evident that all the taxes which can be levied, even to an amount equal to confiscation, on the produce of labour in Mexico, will be found to be far short of the amount necessary to maintain the army, the civil expenditure, and the payment of the interest of the national debt; especially while the church and priests absorb so large a share of the produce of industry.

TABLE of the Expenses of the Mexican Government, in 1840.

The mode of taxation in Mexico is severely and justly commented on by the late American minister, Mr. Thompson. Alluding to the exports, he says, out of the official gross amount.

"Of the average of 22,000,000 of exports, less than 2,000,000 consist of all other articles than the precious metals. I have no doubt that the amount of specie exported is very much larger than is indicated by the books of the custom-houses. A duty of six per cent is levied upon all that is exported, and no one acquainted with the character and practices of Mexican custom-houses, and I may add, of their officers, can believe that the whole amount is returned. The duty upon all that is not returned goes into the pockets of the officers of the customs, and I have no doubt that it amounts to a very large sum. Gold is an article so easily smuggled that enormous sums are sent off in almost every vessel which sails for Europe. *The amount of duties on imports varies, of course, with their ever-changing tariff.* Those who had the best means of forming an accurate estimate during my residence in Mexico, told me that it amounted to from 4,000,000 to 6,000,000 per annum. This, also, would be a most fallacious standard by which to estimate the amount of importations, for the same reason. Eminent writers upon political economy say that any duty above twenty-five per cent offers temptations to smuggling too strong to be resisted. With all the efforts of Buonaparte to carry out his continental system, he was unable to prevent smuggling upon the very limited coast of France—and the insurance in England upon a cargo of goods intended to be smuggled into France was little more than on the same cargo to be regularly imported. How extensive must the practice be in a country like Mexico of more than 10,000 miles of seaboard and frontier, and with so sparse a population!

"In addition to the revenue derived from imports, the direct taxes are exceedingly onerous. Every thing is taxed, from the splendid palaces, coaches, and plate of the wealthy, to the dozen eggs which the poor Indian brings to market. *I do not suppose there is any city in the world where houses are taxed so high, and hence the enormous rents. But after paying the taxes very little is left to the proprietor. A decent house cannot be had for less than 2500 dollars, and from that price to 4000 and 5000 dollars per annum.*

"The government seems to have been engaged in the experiment of how much taxation the people can bear, and they have really achieved a miracle almost as great as that of extracting blood from a turnip. There is no country in the world, which, from its unsurpassed climate, variety of productions and lands, to be had almost for the taking, which, in proportion to its population, is capable of producing so much,—certainly none which does produce so little. The population of Massachusetts is about one-tenth as great as that of Mexico, and its productions very nearly in an inverse ratio with the number of the respective populations—excluding the produce of the mines very much more than in that inversed ratio.

"Besides the sources of revenue which I have mentioned, there is another and a very large one from imposts on internal commerce, that is between one department and another. Every article of commerce thus passing from one department to another, provided it has been opened and the bulk broken, is thus taxed. The principal revenue from the *alcaba*, internal duties, thus derived is from the duty on specie. The revenue from duties on internal commerce in 1840, amounted to 4,500,000 dollars. Another fruitful source of revenue is the per centage of the produce of the mines, seignorage, coining, &c. The charges upon money taken from the mines amount to about five per cent, all of which is paid to the departmental government. The general government receives in addition to this about three per cent, which goes to support the College of the Minería in the city of Mexico."

TOBACCO MONOPOLY.

"The culture of tobacco is prohibited except to a very limited extent in the districts of Orizaba and Cordova. Each farmer is restricted to a limited number of acres. The tobacco produced is sold to the government at a stated price, which was very much below its real value, by whose agents it was made into cigars and snuff, and sold at very large profits. Within the last three years this monopoly was sold by the government to a private company. This company agreed to pay 50,000 dollars per month for this monopoly, which in the time of the vice-regal government yielded the enormous sum of 5,000,000 dollars per annum. This contract has since been rescinded, and the government still possesses the monopoly, which would, if properly managed, and if smuggling could be prevented, produce very nearly as much at this time. But the latter is impossible, and the receipts from this source very little more than cover the expenses of the establishment. At all events the net proceeds do not exceed the sum stipulated to be paid by the company to which it was transferred, that is to say 600,000 dollars per annum."

Mr. Thompson says "a similar sale took place just before I left Mexico of the interest of one-third which the government owned in the Fresnillo Mine, which is at this time the most profitable of all the mines in Mexico. The government derived a revenue of upwards of 500,000 dollars per annum from this mine; it sold the fee-simple for about 400,000 dollars. That is to say, that sum was all which went into the public exchequer—how much more in *gratifications*, I know not; but a very large sum of course. Is it any wonder that officers in the army are forced to sell a certificate of pay due to them, amounting to 2500 dollars, for 125?"

Before the revolution, the King of Spain received, among other ecclesiastical revenues, the ninth part of the tithes, which was granted him by the pope. After the revolution compulsory process for the collection of tithes was abolished, and since that time the government has received nothing from this source, nor of any other revenues which are derived from the church.

There are taxes levied on the cock-pits, the sale of *pulque*, and there is a *monopoly* of

playing cards; and the *ice* is taxed which the Indians bring on their backs in panniers, forty miles from the mountain of Popocatepelt. The revenue from the post-office scarcely pays the expenses.

Mr. Thompson tells us, "Of gunpowder, an immense quantity is used in their civil wars, in the mines, firing cannon on days of religious festivals, and fireworks, for which the Mexicans have a great passion. The powder manufactured is of the most inferior quality; good powder used by sportsmen sells as high as four dollars the pound. This manufacture is also a government monopoly.

"A small amount is realised from the sale of lottery-tickets, raised for special grants to convents and other religious establishments.

"The revenue from the different mints is considerable, but there are no data from which it can be accurately stated.

"The maritime custom-houses in 1832, yielded to the government the sum of 12,000,000 dollars, that is to say, that sum was acknowledged to have been received by the respective custom-house officers; how much more the actual receipts were can only be conjectured. It would, however, be very safe to say at least one-third.

"The receipts at the maritime custom-houses do not now amount to more than 6,000,000 or 7,000,000 dollars. As nothing is more capricious than Mexican legislation on the subject of imports on foreign commerce, it is very difficult to form an estimate approximating accuracy upon this point.

"The following, although not pretending to minute accuracy, may be regarded as in some degree an approximation to a correct estimate of the revenues of the government, and the sources from which they are derived:—

	dollars.
From the maritime custom-houses	6,500,000
Interior commerce	4,500,000
Direct taxes	3,000,000
Per centage on produce of mines	1,000,000
Profits of mints	500,000
Tobacco monopoly	500,000
Post-office, lotteries, manufactures of powder and salt	500,000
Tolls and all other sources	500,000
	<hr/>
	16,000,000

"The local taxes levied by the different departments which may be stated at 4,000,000 dollars more, making an aggregate of 21,000,000 dollars, to which an addition should be made of 5,000,000 or 10,000,000 dollars more which is paid, but embezzled, and, therefore, does not find its way into the public treasury.

"With a government wisely and honestly administered, this sum is more than is necessary. But how that of Mexico is supported with it, and whence it is derived, are both, as I have said, inexplicable to me. Besides their army, of 30,000 to 40,000 men, for that is the number on the pay list, and an immense disproportion of this army officers, not less than from 200 to 300 generals, an otherwise enormous civil list, and the interest on a debt very little short of 100,000,000 dollars, there are a great variety of other and extraordinary charges upon a government so unstable and revolutionary.* With a productive industry at least fifty times as great as that of Mexico, very little more than the sum above stated is levied on the people of the United States. The annual expenditure of the vice-regal government was never more than 8,000,000 dollars. Can it be true that it costs more to execute laws made by the people themselves than the edicts of a despot?

"To all these heavy items must be added the taxes which are levied by the different departments for domestic purposes, the heavy exactions of tithes and other compulsory contributions to the church. These last have been estimated at 2,000,000 dollars, but they must greatly exceed that amount. There are in the city of Mexico alone, 700 or 800 secular, and near 2000 regular clergy. The salaries of some of them are enormous. Under the vice-regal government the various perquisites and salary of the archbishop

* The Report of the Secretary of the Treasury in 1832, contains an estimate of the whole expenses of the government for the next year, amounting to 22,392,508 dollars. Of this sum the estimate for the army is stated at 16,466,121 dollars.

amounted to 130,000 dollars, and those of several of the bishops to 100,000 dollars, but they are all much less now. Exclusively of donations and birth-day presents, which are often very large, the archbishop does not receive more than 30,000 or 40,000 dollars, and the incomes of the bishops are proportionately reduced.

"Some idea may be formed of the amount of these birth-day presents, from the fact that General Santa Anna, on the anniversary of his birth, has been known to receive presents to the amount of 20,000 dollars.

"All these enormous charges are to be paid out of the productions of a country where less is produced than in any other, except from the mines. Perhaps the universal dilapidation of all the old and large estates may indicate the quarter from which much of the revenue has hitherto been derived.

"The large estates and possessions of the banished Jesuits have supplied the government with very large sums. But these, with the mine of Fresnillo, have all been sold and the money wasted."—*Thompson's Recollections of Mexico*, 1846.

Mr. Thompson does not scruple to make the church property of Mexico, subsequent to the paying of the national debt, and contributory to the annual expenditure.

Speaking of the cathedral of Mexico, he says—

"Upon entering it, one is apt to recall the wild fictions of the Arabian Nights; it seems as if the wealth of empires was collected there. The clergy in Mexico do not, for obvious reasons, desire that their wealth should be made known to its full extent; they are, therefore, not disposed to give very full information upon the subject, or to exhibit the gold and silver vessels, vases, precious stones, and other forms of wealth; quite enough is exhibited to strike the beholder with wonder. The first object that presents itself on entering the cathedral is the altar, near the centre of the building; it is made of highly-wrought and highly-polished silver, and covered with a profusion of ornaments of pure gold. On each side of this altar runs a balustrade, enclosing a space about eight feet wide and eighty or a hundred feet long. The balusters are about four feet high, and four inches thick in the largest part; the hand-rail from six to eight inches wide. Upon the top of this hand-rail, at the distance of six or eight feet apart, are human images, beautifully wrought, and about two feet high. *All of these, the balustrade, hand-rail, and images, are made of a compound of gold, silver, and copper—more valuable than silver.* I was told that an offer had been made to take this balustrade, and replace it with another of exactly the same size and workmanship of pure silver, and to give 500,000 dollars besides. There is much more of the same balustrade in other parts of the church; I should think, in all of it, not less than 300 feet.

"As you walk through the building, on either side there are different apartments, all filled, from the floor to the ceiling, with paintings, statues, vases, huge candlesticks, waiters, and a thousand other articles, made of gold or silver. This, too, is only the every day display of articles of least value; the more costly are stored away in chests and closets. What must it be when all these are brought out, with the immense quantities of precious stones which the church is known to possess? And this is only one of the churches of the city of Mexico, where there are between sixty and eighty others, and some of them possessing little less wealth than the cathedral; and it must also be remembered, that all the other large cities, such as Puebla, Guadajara, Guanajuato, Zacatecas, Durango, San Louis, Potosi, have each a proportionate number of equally gorgeous establishments. It would be the wildest and most random conjecture to attempt an estimate of the amount of the precious metals thus withdrawn from the useful purposes of the currency of the world, and wasted in these barbaric ornaments, as incompatible with good taste as they are with the humility which was the most striking feature in the character of the Founder of our religion, whose chosen instruments were the lowly and humble, and who himself regarded as the highest evidence of his divine mission, the fact that 'to the poor the gospel was preached.' *I do not doubt but there is enough of the precious metals in the different churches of Mexico to relieve sensibly the pressure upon the currency of the world, which has resulted from the diminished production of the mines, and the increased quantity which*

has been appropriated to purposes of luxury, and to pay the cost of much more tasteful decorations in architecture and statuary, made of mahogany and marble.

"But the immense wealth which is thus collected in the churches is not by any means all, or even the larger portion, of the wealth of the Mexican church and clergy. They own very many of the finest houses in Mexico and other cities (the rents of which must be enormous), besides valuable real estates all over the republic. *Almost every person leaves a bequest in his will for masses for his soul, which constitute an incumbrance upon the estate, and thus nearly all the estates of the small proprietors are mortgaged to the church. The property held by the church in mortmain is estimated at fifty millions.*

"*Mexico is, I believe, the only country where the church property remains in its untouched entirety.* Some small amount has been recently realised from the sale of the estates of the banished Jesuits; but, with that exception, no president, however hard pressed (and there is no day in the year that they are not hard pressed), has ever dared to encroach upon that which is regarded consecrated property, *with the exception of Gomez Farrias, who, in 1834, proposed to the legislative chambers to confiscate all the church property, and the measure would, no doubt, have been adopted, but for a revolution which overthrew the administration.*

"But it is impossible that such a state of things can last always. *As a means of raising money, I would not give the single institution of the Catholic religion of masses and indulgences for the benefit of the souls of the dead, for the power of taxation possessed by any government.* No tax-gatherer is required to collect it; its payment is enforced by all the strongest and best feelings of the human heart. All religions and superstitions have their priesthood and their priestcraft, from the reptile worship of the Nile to our own pure and holy religion; but of all the artifices of cunning and venality to extort money from credulous weakness, there is none so potential as a mass for the benefit of souls in purgatory. It would seem to be in direct contradiction to the Saviour, in the comparison of the camel passing through the eye of a needle. Nothing is easier than for a rich man to enter the kingdom of heaven; he purchases that entrance with money. He who can pay for most masses, shortens in proportion the period of his probation of torment in purgatory. Who is it that will not pay his last farthing to relieve the soul of a departed friend from those torments? I do not know how the fee for these masses is exacted, but I do know that it is regularly paid; and that without the fee, the mass would be regarded of no value or efficacy. I remember that my washer-woman once asked me to lend her two dollars. I asked her what she wanted with it. She told me that there was a particular mass to be said on that day, which relieved the souls in purgatory from ten thousand years of torment, and that she wished to secure the benefit of it for her mother. I asked her if she was fool enough to believe it. She answered, 'Why, yes, sir, is it not true?' and with a countenance of as much surprise as if I had denied that the sun was shining. On a day of religious festival (the anniversary of St. Francisco), I have seen, stuck up on the door of the church of San Francisco—one of the largest and most magnificent in Mexico, a small advertisement, of which the following was the substance:—

"His Holiness the Pope (and certain bishops which were named) have granted thirty-two thousand three hundred years, ten days, and six hours of indulgence* for this mass."

"I do not remember exactly the number of years, days, and hours, but I positively assert that it specified the number of each, and I believe that I have stated them correctly. The manifest object of this minute particularity is to secure the more effectual belief in the imposture. By thus giving to it the air of a business transaction, a sort of contract between the devotee and the Almighty, by his authorised agent and vicegerent on earth, the Pope, is established—a contract the more binding in its character because the receipt of the consideration is acknowledged. I tremble at the apparent blasphemy of even describing such things.

"Mr. Brantz Mayer gives a literal copy of an advertisement which was stuck up in the beautiful church of Gaudeloupe, on the festival of Nuestra Señora de Guadeloupe, of which the following is a translation:—

* An indulgence is defined:—A remission of the punishment due for sins; a plenary indulgence, is a remission of the whole punishment; a particular indulgence, a remission of a part only.

“The faithful are reminded that the most illustrious Bishops of Puebla and Tarazona have granted an indulgence of eighty days for every quarter of an hour which the said images are exposed, and five hundred days for each Ave Maria which is recited before either of them. Lastly, the most excellent Fr. Jose Miria de Jesus Belaumzaron, for himself, and for the most illustrious the present Bishops of Puebla, Michoacan, Jolisci, and Durango, has granted an indulgence of two hundred days for every word of the appointed prayers to our most exalted lady, for every step taken in her house, for every reverence performed, and for every word of the mass which may be uttered by the priest or the hearers; as many more days of indulgence are granted for every quarter of an hour in which these images are exposed, in the balconies, windows, or doors, for public adoration.”

We have not made these extracts, from the most recent works, with a view of reflecting on the Catholic religion; but in order to exhibit the oppressive and ruinous character and privileges of the church establishment. Hereafter we will show that in Catholic Brazil no such abuses exist in regard to church revenues.

CHAPTER XXXIII.

ARMY AND NAVY.

THE will of the army, has actually formed what may be termed the only public opinion in Mexico: for the military commander who has been the most fortunate in obtaining the control over a major part of the army, has been the most successful in carrying out a *pronunciamiento*, and in overturning the government of the day.

The constitution or formation of this army is described by all authorities, and especially by the late American minister, Mr. Thompson, in no favourable character. This army has, to a great degree, been formed and is recruited by sending forth armed detachments into the mountains and wilds to capture the aborigines. These are actually brought in chains to some military head-quarters. Mr. Thompson says:—

“Droves of miserable and more than half-naked wretches are seen chained together and marching through the streets to the barracks, where they are scourged and then dressed in a uniform made of linen cloth or of serge, and are occasionally drilled—which drilling consists mainly in teaching them to march in column through the streets. Their military bands are good, and the men learn to march indifferently well—but only indifferently well—they put their feet down as if they were feeling for the place, and do not step with that jaunty, erect, and graceful air which is so beautiful in well-drilled troops. As to the wheelings of well-trained troops, like the opening and shutting of a gate, or the prompt and exact execution of other evolutions, they know nothing about them. There is not one in ten of these soldiers who has ever seen a gun, nor one in a hundred who has ever fired one before he was brought into the barracks. It is in this way that the ranks of the army are generally filled up—in particular emergencies the prisons are thrown open, *which always contain more prisoners than the army numbers, and these felons become soldiers, and some of them officers.* Their arms, too, are generally worthless English muskets which have been condemned and thrown aside, and are purchased for almost nothing and sold to the Mexican government. Their powder, too, is equally bad; in the last battle between Santa Anna and Bustamente, which lasted the whole day, not one cannon-ball in a thousand reached the enemy—they generally fell

about half-way between the opposing armies. I do not think that the Mexicans are deficient in courage ; or it might be more properly said that they are indifferent to danger or the preservation of a life which is really so worthless to the most of them. But with the disadvantages to which I have adverted, the reader will not be surprised that in all the conflicts with our people, in which they have been more or less engaged for the last thirty years, they have always been defeated."

A Mexican officer, in admitting that cavalry alone were not able to break a well-formed square of infantry, asserted that in this respect the Mexican cavalry had in this the advantage over all others ;—that the cavalry *armed* with lassoes rode up and threw them over the men forming the squares, and pulled them out, and thus made the breach.

"The Mexican army," says Mr. Thompson, "and more particularly their cavalry, may do very well to fight each other, but in any conflict with our own or European troops, it would not be a battle but a massacre. What then must be the murderous inequality between a corps of American cavalry and an equal number of Mexicans? The American corps, from the superior size of their horses, would cover twice as much ground, and the obstruction offered by the Mexicans on their small and scrawny ponies would scarcely cause their horses to stumble in riding over them ; to say nothing of the greater inequality of the men themselves, five to one at least in individual combats, and more than twice that in a battle. The infantry would be found even more impotent."

Mr. Thompson observes that there are in Mexico "more than two hundred generals, most of them without commands. Every officer who commands a regiment has the title of general, and is distinguished from generals who have no commands by the addition of 'general efectivo.' The rate of pay is not very different from that of our own army. Each officer and soldier, however, is his own commissary, no rations being issued ; and they are well satisfied if they receive enough of their pay to procure their scanty rations, which was very rarely the case, except with Santa Anna's favourite troops, whom he always kept about his person, and this made it their interest to sustain him. In one of the last conversations which I had with him, I told him *that the army would remain faithful to him just so long as he could pay them and no longer*, and that I did not see how it was possible for him to pay them much longer.

"The result proved the truth of both predictions, and that, I have no doubt, was the cause of the revolution which overthrew him. Shortly before I left Mexico, an officer in the army came to the city and settled his accounts with the war department, and received a certificate that twenty-five hundred dollars were due to him ; after hawking it about amongst the brokers, he sold the claim for a hundred and twenty-five dollars, which was five cents on the dollar."

He considers that the Mexican men (Indians in particular) have no more physical strength than the women of the United States. They are of diminutive stature, unaccustomed to exercise or labour. Marauding bands of Comanches penetrate several hundred miles into Mexico, levy black mail, carry off horses, cattle, and captives. He says "that there are not at this time (1846) less than 5000 Mexicans slaves of the Comanches, and of all our western tribes are the most cowardly. The Delawares frequently *whip them five to one* !

"That which is in all respects the greatest nuisance and the most insuperable barrier to the prosperity of Mexico is the army. They will tell you there that it amounts to fifty thousand men, but they have never had half the number. I have no doubt that the accounts at the department of war exhibit nearly the number stated, but a large proportion of them are men of straw—fictitious names fraudulently inserted for the benefit of the officers who pay them. They are paid every day, or rather that is the law, but the pay is just as fictitious as the muster-rolls."

Mr. Brantz Mayer gives the following statement of the army of Mexico:—

“I may state that the forces have been considerably augmented and in all probability amount to 40,000 men. In 1840 the Mexican army was composed of

CHAPTER XXXIV.

MINES AND MINERALS OF MEXICO.

WITH regard to the capabilities and resources of Mexico, the precious metals have at all periods, since the first conquest of the country by Cortez, been the objects of primary avidity with the Spanish rulers and people. They considered gold and silver as the standard of the value of these vast regions; and, they disregarded their really far richer powers of production, those of agriculture. The latter was only attended to with reluctance, and merely from necessity to obtain food.

With the exception of the silver and gold mines, the mineralogy of Mexico has been nearly altogether neglected. Tin, lead, and the finest copper are found in large quantities, but very little of any of these are wrought.

Under the Spanish government of Spain, it is remarked in Thompson's *Alcedo* (1814)—“The mines of Nueva Espana are, at this moment, the most productive of any that were ever worked in any country, at any period of history; and yet the whole number of persons employed in working these mines under ground, does not exceed 30,000, or one two-hundredth part of the whole population of the kingdom. Some of the occupations connected with mining are more laborious, and less favourable to health, than the employments of agriculture; but the choice of such occupations is voluntary, for, in Mexico at least, the labour of the miner is perfectly free, his wages are high, in proportion to the unwholesomeness, disagreeableness, and severity of his work; and he is secure from bad usage, as he is at liberty to quit his master and employment when he pleases, and may hire himself, if he chooses, at another mine. The *mita*

tanda, or forced labour of the Indians, has been abolished in Mexico for at least forty years."

According to Von Humboldt, "The circumstances of the principal Mexican mines are favourable to the health and accommodation of the miners: instead of being situated in barren mountains, adjoining to the limits of perpetual snow, like the mines of Potosi, Pasco, and Chota, in Peru, the richest and most abundant mines of Nueva Espana are not more than 1700 or 2000 metres above the level of the sea, in the midst of cultivated fields, cities, and villages; affording, in abundance, all that can be wanted for the use of the mine or convenience of the miner. It is accordingly found, that the mortality in the mining districts of Mexico, is not greater than in other parts of the kingdom. An examination of the parish registers of Guanajuato and Zacatecas, which are the seats of the two principal mines of Nueva Espana, has convinced Mr. Humboldt of this truth; he found, that in Guanajuata the number of births from 1797 to 1802 was, to the number of deaths, as 201 to 100."—[This statement is, with due deference for Von Humboldt, in our opinion, problematical.]

Alcedo continues—"But, if the labour of the mines is not that scourge of humanity, which well-meaning but ill-informed writers have imagined, there can be no doubt of the propriety of stating the increased productiveness of the mines as one of the symptoms of the growing prosperity of the country. An increase of the produce of the precious metals tends, no doubt, to a depreciation of their value; but this objection, which has been urged in Europe, against the further working of the American mines, would apply, with equal force, against the extension of any branch of agriculture or manufactures: every increase of supply tends to diminish the value of the article produced; but the natural corrective of this evil, when it becomes one, is the reduction of profit to the grower or manufacturer, who will abandon his trade or occupation as soon as he finds that he can no longer carry it on with advantage. But so far is the trade of mining from having arrived at this state in America, that at no period since the discovery of that continent, have there been so many opulent individuals engaged in mining, or such quantities of the precious metals extracted annually from the mines. In the kingdom of Nueva Espana, in particular, the improvement of the mines has been rapid and considerable, as will appear from the following table, which gives the average of the annual coinage of Mexico, during successive periods, from 1732 to near the present time, extracted from the registers of the mint."

AVERAGE of the annual Coinage of Mexico.

Y E A R S.	Silver.	Gold.	TOTAL.
	dollars.	dollars.	dollars.
From 1733 to 1742, ten years.....	8,998,209 1-5	434,050 2-5	9,432,259 3-5
1743 to 1752, ten years.....	11,566,030	455,109 9-10	12,021,139 9-10
1753 to 1762, ten years.....	11,971,835 2-5	462,773 1-2	12,434,603 9-10
1763 to 1771, nine years.....	11,777,909 1-3	761,553 1-3	12,539,462 1-3
1772 to 1782, eleven years.....	17,551,906 3-12	835,586	18,387,492 3-11
1783 to 1792, ten years.....	19,491,309 9-10	644,040 3-5	20,135,340 1-2
In 1793	23,428,080	884,262	24,312,342
From 1795 to 1804, ten years.....	21,084,787 3-5		

"The first six rows of figures in the preceding table, are calculated from *data* furnished by the *Mercurio Peruano*, vol. x. p. 133: the seventh is extracted from the same work, vol. xi. p. 13; and the last calculated from a statement furnished by Espinosa, director of the *caza de consolidacion*, or sinking fund at Madrid. As *very little bullion was exported from Mexico*, the amount of the coinage is, in general, very nearly equal to the amount of the produce of the mines; occasionally, however, it is less. In 1790, 1,500,000 dollars were remitted, in bullion, to the king from Vera Cruz.

"The silver mines of Nueva Espana, the most productive of any that have ever been known, are remarkable for the poverty of the mineral they contain. A quintal, or 1600 ounces of silver ore, affords, at a medium, not more than three or four ounces of pure silver: the same quantity of mineral, in the silver-mines of Marienberg in Saxony, yields from ten to fifteen ounces. It is not, therefore, the richness of the ore, but its

abundance, and the facility of working it, which render the mines of Nueva Espana so much superior to those of Europe.

"The mines of Guanajuato, infinitely richer than those of Potosi ever were, afforded, from 1796 to 1803, near 40,000,000 of dollars in gold and silver, or very near 5,000,000 of dollars annually; that is, somewhat less than one-fourth of the whole quantity of gold and silver from Nueva Espana; yet these mines, productive as they were, did not employ more than 5000 workmen of every description. The labour of the mines is perfectly free in Mexico, and no species of labour is so well paid; a miner earns from twenty-five to thirty francs a week, that is, from five to five dollars and a half; while the wages of the common labourer are not more than a dollar and a half. The *tenateros*, or persons who carry the ore on their backs from the place where it is dug out of the mine, to the place where it is collected in heaps, receive six francs for a day's work of six hours. No slaves, criminals, or forced labourers, are ever employed in the Mexican mines."—*Alcedo*.

Von Humboldt points out many defects and imperfections in working the mines of Nueva Espana.

"More than three-fourths of the silver obtained from America, is extracted from the ore by means of quicksilver: the loss of quicksilver in this operation, Mr. Humboldt estimates has been about 16,000 quintals a year, and in the whole of America, about 25,000 quintals are annually expended; the cost of which, in the colonies, is 6,200,000 livres. The greater part of this quicksilver has been furnished by the mine of Almaden in Spain, and the residue was obtained from Istria in Carniola; in 1802, Almaden alone supplied more than 20,000 quintals. Huencavelica in Peru, which in the sixteenth century afforded for some years more than 10,000 quintals of quicksilver in a year, did not yield, in 1814, quite 4000. Humboldt seems to be of opinion that there are mines of *cinnabar in America*, sufficient for the purpose; he enumerates several in Nueva Espana and Nueva Granada, as well as in Peru.

"It is the supply of mercury that determines the productiveness of the silver-mines; for such is the abundance of the ore both in Mexico and Peru, that the only limit to the quantity of silver obtained from those kingdoms, is the want of mercury for amalgamation. The sale of quicksilver in the Spanish colonies has been a royal monopoly, and the distribution of it among the miners a source of influence, and possibly of profit, to the servants of the crown. Gulvez, to whom America is indebted for a system of free trade, reduced the price of quicksilver from eighty-two to forty-one dollars the quintal, and thereby contributed most essentially to the subsequent prosperity and increase of the mines."—*Alcedo*.

"The annual produce of the mines of Nueva Espana, as calculated from the amount of the royal duties, up to 1812, and therefore considerably under the truth, amounted to 7000 Spanish marks of pure gold, and 2,250,000 dollars of pure silver; the value, in dollars, of both is 22,170,740; the gold being estimated at 145 $\frac{9}{10}$ dollars, and the silver at 9 $\frac{1}{10}$ dollars, the Spanish mark; besides this we must add for contraband 829,260 dollars, and the total produce will then be 23,000,000.

TABLE of the Coinage of Mexico, from the earliest Periods to the present Day.

Y E A R S.	Amount.	Y E A R S.	Amount.
	dollars.		dollars.
The mint of the city of Mexico, was established in 1535, but there are no returns for the first 155 years, until 1690. If we take the average of the coinage of these years to have been 1,000,000, we shall have.....	155,000,000	From 1834..... Brought forward.....	1,841,457,875
From 1690 to 1803, inclusive.....	1,353,452,020	1835.....	12,040,000
1803 to 1821, ".....	261,354,022	1836.....	12,000,000
1822.....	5,543,254	1837.....	12,050,000
1823.....	3,567,821	1838 to 1843 (averaging 12,000,000)...	11,610,000
1824.....	3,503,880		60,000,000
1825.....	6,036,878	To this must be added the coinage of state mints, not included in above:	
1825 to 1831 (on an average 3,000,000 per annum).....	15,000,000	Guanajuato, from 1812 to 1826.....	3,024,194
1831.....	13,000,000	Zacatecas, " 1810 to 1826.....	32,108,155
1832.....	12,500,000	Guadalupe, " 1812 to 1826.....	5,659,159
1833.....	12,500,000	Durango, " 1811 to 1826.....	7,483,626
Carried forward.....	1,841,457,875	Chihuahua, " 1811 to 1814.....	3,003,660
		Sombrerete, " 1810 to 1811.....	1,561,249
		All of these for the five years (after 1826), since which they have been calculated in the general coinage.....	66,000,000
		Total.....	2,062,597,948

This amount is less than it has been made by several other writers. See also "General Account of Precious Metals, and of the Coinage of Mexico and of South America."

CHAPTER XXXV.

AGRICULTURE OF MEXICO.

It will appear, from the miscellaneous descriptive sketches which we have given of Mexico—and nearly all accounts corroborate the fact, that agriculture is in a most rude and most backward condition throughout nearly all Mexico. Prohibition of foreign agricultural products has been persevered in, but husbandry has not improved. Cotton-wool is prohibited: the climate and soil is favourable to its culture, but enough is not produced to supply the demand for the miserable cotton factories of the country; although cotton-wool sells for treble price at which it could be imported from the United States of America.

One cause of slovenly agriculture, and of the indolence of the rural population, is the facility of obtaining sufficient food from the natural products of the soil.*

* In his account of the agriculture of Mexico, Von Humboldt enters into many curious and interesting details concerning the origin, natural history, and cultivation of the different vegetable productions of that country.

Of all productions cultivated for the use of man, none affords so much food from the same quantity of land as the plantain or banana tree: a field of 100 square metres in plantain trees affords 4000 lbs. weight of food; the same field in wheat will produce about thirty lbs.; and in potatoes ninety lbs. The quantity of food from the plantain tree is, according to Von Humboldt, to the quantity of food from wheat as 133 to one, and to the quantity from potatoes as forty-four to one; the quantities of nourishment, however, are not proportioned to the weights, for the fruit

We believe that the mines of precious metals are to some extent another cause: high authorities deny this.

The assertion that the backwardness of agriculture in Spanish America has been owing to its mines of gold and silver, has been refuted by Humboldt; he admits, "that in some districts, as in Choco and other parts of New Grenada, the people leave their fields uncultivated, while they misspend their time in searching for gold dust in the beds of rivers. It is also true, that in Cuba, Caracas, and Guatemala, where there are no mines, many highly cultivated tracts of country are to be found; but, on the other hand, the agriculture of Peru is not inferior to that of Cumana or Guayana; and in Mexico, the best cultivated district is the territory extending from Salamanca to Guanajuato and Leon, in the midst of the most productive mine of the world. So far from the mining being prejudicial to agriculture, no sooner is a mine discovered and wrought, than cultivation is seen in its neighbourhood; towns and villages are built; provisions are wanted for the workmen, and subsistence for the cattle employed in the mine: whatever the surrounding country can be made to produce, is raised from it in abundance. A flourishing agriculture is established, which not unfrequently survives the prosperity of the mines, to which it was indebted for its origin; the husbandman remains and cultivates his fields, after the miner, who had at first set him to work, is gone to another district, in search of a more abundant or less exhausted vein. The Indians, in particular, who prefer a mountainous situation to living on the plains, seldom quit the farms they have established, though the mines are abandoned, which were, perhaps, their original inducement for settling there. Indian villages and farms are continually found in the valleys, and amidst the precipices of the highest mountains."—*Humboldt. Alcedo.*

Notwithstanding the authority of M. Von Humboldt, it is considered that, generally speaking, agriculture is in a very backward condition.—(See Mayer, Gilliam, and other recent authorities.)*

PRINCIPAL ARTICLES OF CULTURE.—The same soil and climate which produces the plantain tree, yields the *farina* of the cassava root, called *manioc*, which is made into bread; and which the natives call *pan de tierra caliente*. The flour of manioc, when dried and toasted, is secure from the depredations of worms and other insects: it contains, besides

of the plantain tree contains a greater portion of mucilaginous juice than the seeds of the *cerealia*. An *arpent*, covered with plantain trees, will maintain fifty persons: the same quantity of ground sown with wheat, will not, he contends, support two individuals. The plantain tree does not thrive where the medium temperature is below 24 deg. (centign. therm., or 75.2 deg. F.), but there are 60,000 square leagues of the Mexican territory in that situation. The fruit of the plantain tree is farinaceous, but contains a small portion of vegetable gluten, and a great quantity of saccharine matter. Mr. Humboldt remarks, that in all tropical countries, saccharine matter is considered to be eminently nutritious.

* "Mexico," says Chevalier, "is a country so rich that famine scarcely visits even the most indolent. In the *tierras calientes*, and even on the *plateau*, the natives are content to dwell with their families in a cabin of bamboo trellis-work, so slight as scarcely to hide them from the stranger's gaze, and to sleep either on mere mats or at best on beds made of leaves and brushwood. Their dress consists simply of a pair of drawers, or petticoat, and a serape (a dyed woollen garment) which serves for a cloak by day and a counterpane by night. Each has his horse, a sorry beast, which feeds at large in the open country; and a whole family of Indians is amply supplied with food by bananas, chili, and maize, raised almost without labour, in a small inclosure round the hut. Labour, indeed, occupies but a trifling portion of the Indian's time, which is chiefly spent in drinking pulque, sleep, or singing to his wretched mandolin hymns in honor of Notre Dame de Gaudaloupe, and occasionally carrying votive chaplets to deck the altar of his village church. Thus he passes his life in a dreamy indifference, and utterly careless of the ever-reviving émeutes by which the peace of Mexico is disturbed. The assassinations and robberies which the almost impotent government allows to be committed with impunity on the public roads, and even in sight of the capital, are to him only matter for conversation—the theme of a tale or ditty. And why should he trouble himself about it? Having nothing in the world but the dress in which he stands, his lance, spurs, and guitar, he has no fear of thieves; nor will the poniard of the assassin touch him, if he himself, drunk with pulque or chingarito, do not use his own."

farinaceous fecula, a saccharine matter and a viscous substance resembling caoutchouc. The cassava root is not cultivated in New Spain at a greater height than 600 or 800 metres above the level of the sea; its poisonous juice becomes harmless by boiling, and separating the scum that rises to the top, and is then used by the natives for seasoning their food. The original inhabitants of Hayti, after the conquest of their country by the Spaniards, used to poison themselves with this juice, and for that purpose assembled in parties of fifty or more to take it together.

MAIZE is the chief food of the inhabitants of Mexico: it is cultivated from the coast to the height of 2800 metres above the sea; in very fertile lands, and in very good years, it gives a return of 800 to one; but the average return for the *intra-tropical* part of the country is not more than 150 for one; in very hot and moist districts two or three crops are obtained in the year, but in most parts of the country only one is grown. No crop is more uncertain than maize, and as it is seldom equally good in every part of the kingdom, the transport of maize comes to be the principal branch of internal commerce; a general failure of the crop would be followed by scarcity, or even famine. The annual produce of maize was estimated by Humboldt at 17,000,000 of *fanegas* annually. It may be preserved for three years at Mexico, and in colder climates for six or seven years. The Indians prepare a fermented liquor from maize, and before the arrival of the Spaniards, they extracted sugar from the stalks.

WHEAT.—None of the *cereal*ia of the old continent were known in America when it was first discovered. Wheat is not cultivated in the intra-tropical part of Mexico, at a lower elevation than 800 or 900 metres above the level of the sea, and in very small quantity at a less height than 1200 or 1300. At a greater elevation than 3500 or 4000 metres, neither wheat nor rye come to maturity. The Mexican wheat is of excellent quality, and the medium return wherever grown is from twenty-two to twenty-five for one: in some places it gives from thirty to forty for one. Much wheat has been exported from Vera Cruz to Cuba: barley and rye thrive very well in parts of Mexico; oats are very little cultivated; the potato is a great object of culture in the high and cold parts of the country: rice is but little attended to, though well adapted for the marshy lands along the sea coast.

VINEYARDS.—The Spanish government has always discouraged in its colonies the cultivation of the vine, the olive, the mulberry tree, and the plants yielding hemp and flax. While Humboldt was in Mexico, an order came from Madrid to grub up all the stocks of vines in the north part of the country, where they had been cultivated with so much success as to call forth the complaints of the wine merchants of Cadiz. There was then but one olive plantation in Mexico; it belonged to the archbishop of Mexico; tobacco was also subjected, and continues to be subjected to monopoly. In 1764, a royal monopoly was established, and no tobacco was allowed to be planted, except in particular districts, and none sold, except to the king's officers. Parties of soldiers have been regularly employed to go about the country in search of tobacco-fields, and impose fines on the owner of prohibited culture, and destroy the plantation: this odious monopoly yielded to the King of Spain, in Mexico alone, a revenue of more than 20,000,000 of livres annually.

AGAVE, OR MAGUEY.—The plantations of the *maguey de pulque* extend wherever the Aztec language is spoken. On the Mexican plain the maguey is scarcely cultivated to the north of Salamanca. The finest cultivations are in the valley of Toluca and on the plains of Cholula. The agaves are there planted in rows at a distance of fifteen decimetres, or fifty-eight inches, from one another. The plants only begin to yield the juice or sap, when the *hampe* is on the point of efflorescence. The cultivator goes daily through his *gave* plantations to mark those plants which approach efflorescence.

On the situation, on the soil, and on the temperature of the climate, depend the early or later periods of efflorescence. Near Cholula, and between Toluca and Cacanumacan, a maguey of eight years old gives signs of development of its *hampe*. They then begin to collect the juice, of which the pulque is made. They cut the *corason* or bundle of central leaves, and enlarge insensibly the incision, and cover it with lateral

leaves, which they raise up by drawing them close, and tying them to the extremities. In this incision the vessels appear to deposit all the juice which would have formed the *colossal hampe* loaded with flowers.

"This is a true vegetable spring, which keeps running for two or three months, and from which the Indian draws three or four times a day. We may judge of the quickness or slowness of the motion of the juice by the quantity of honey extracted from the maguey at different times of the day. A foot commonly yields, in twenty-four hours, four cubic decimetres, or 200 cubic inches (242 cubic inches English), equal to eight *quartillos*. Of this total quantity they obtain three *quartillos* at sunrise, two at mid-day, and three at six in the evening. A very vigorous plant sometimes yields fifteen *quartillos*, or 375 cubic inches (454 cubic inches English) per day, for from four to five months, which amounts to the enormous volume of more than 1100 cubic decimetres, or 67,130 cubic inches. This abundance of juice produced by a maguey of scarcely a metre and a half in height, or $4\frac{9}{10}$ feet, is so much the more astonishing, as the agave plantations are in the most arid grounds, and frequently on banks of rocks hardly covered with vegetable earth. The value of a maguey plant near its efflorescence is at Pachuca five piastres, or 1*l.* 2*s.* 4*d.* In a barren soil the Indian calculates the produce of each maguey at 150 bottles, and the value of the pulque furnished in a day at from ten to twelve sols. The produce is unequal, like that of the vine, which varies very much in its quantity of grapes.

"The cultivation of the agave has real advantages over the cultivation of maize, grain, and potatoes. This plant, with firm and vigorous leaves, is neither affected by drought nor hail, nor the excessive cold which prevails in winter on the higher *Cordilleras* of Mexico. The stalk perishes after efflorescence. If we deprive it of the central leaves, it withers, after the juice which nature appears to have destined to the increase of the hampe is entirely exhausted. An infinity of shoots then spring from the root of the decayed plant; for no plant multiplies with greater facility. An arpent of ground contains from 1200 to 1300 maguey plants. If the field is of old cultivation, we may calculate that a twelfth or fourteenth of these plants yields honey annually. A proprietor who plants from 30,000 to 40,000 maguey is sure to establish the fortune of his children; but it requires patience and courage to follow a species of cultivation which only begins to grow lucrative at the end of fifteen years. In a good soil the agave enters on its efflorescence at the end of five years; and in a poor soil no harvest can be expected in less than eighteen years. Although the rapidity of the vegetation is of the utmost consequence for the Mexican cultivators, they never attempt artificially to accelerate the development of the hampe by mutilating the roots or watering them with warm water. It has been discovered that by these means, which weaken the plant, the confluence of juice towards the centre is sensibly diminished. A maguey plant is destroyed, if, misled by false appearances, the Indian makes the incision long before the flowers would have maturely developed themselves."—*Thompson's Alcedo*.

"The juice of the agave is of a very agreeable sour taste. It easily ferments, on account of the sugar and mucilage which it contains. To accelerate the fermentation, they add a little old and acid pulque. The operation is terminated in three or four days. The vinous beverage, which resembles cider, has an odour of putrid meat extremely disagreeable; but the Europeans who have been able to get over the aversion which this fœtid odour inspires, prefer the pulque to every other liquor. They consider it as stomachic, strengthening, and especially as very nutritive; and it is recommended to lean persons. Whites also who have been known, like the Mexican Indians, totally to have abstained from water, beer, and wine, and to have drunk no other liquor than the juice of the agave. Connoisseurs speak with enthusiasm of the pulque prepared in the village of Hocotitlan, situated to the north of Toluca, at the foot of a mountain almost as elevated as the Nevado of this name. They affirm that the excellent quality of this pulque does not altogether depend on the art with which the liquor is prepared, but also on a taste of the soil communicated to the juice, according to the fields in which the plant is cultivated. There are plantations of maguey near Hocotitlan (*haciendas de pulque*) which bring in annually more than 40,000 livres, or 1666*l.* sterling."—*Alcedo. Humboldt*.

A strong spirit is distilled from the pulque, called *mexical*, or *aguardiente*

de maguey. The sugar-cane of a particular variety, with a violet-stalk, originally from the coast of Africa (*cano de Guinea*), is preferred in the province of Caracas for the fabrication of rum to the sugar-cane of Otaheite. The Spanish government, and particularly the *real hacienda*, prohibited the distillation of *mexical*, as prejudicial to the Spanish brandy trade. An enormous quantity, however, of this maguey spirit was clandestinely manufactured in the intendances of Valladolid, Mexico, and Durango, and especially in Leon.

The fibre of the maguey is formed into flax, and of it is also made the papyrus (*cyperus papyrus* of the Egyptians). The paper on which the ancient Mexicans painted their hieroglyphical figures was made of the fibres of agave leaves, cleansed in water, and disposed in layers like the fibres of the Egyptian cyperus, and the mulberry (*broussonetia*) of the South Sea Islands. Humboldt brought to Europe several fragments of Aztec manuscripts written on maguey paper, so varied in thickness that some resembled pasteboard, others Chinese paper. These fragments were interesting as the Mexican hieroglyphics deposited at Vienna, Rome, and Veletri, are on *Mexican stag-skins*. The thread of maguey flax is called *pite-thread*.

The Mexicans cultivate all the garden-stuffs and fruit-trees of Europe.* The Aztecs and some other nations of Americans cultivated onions (in Mexican *xonacatl*), haricots (in Mexican *ayacotli*, in the Peruvian or Quichua language *purutu*), and gourds (in Peruvian *capallu*). Cortes, speaking of the eatables which were daily sold in the market of the ancient Tenochtitlan, expressly says, that every kind of garden-stuff (*legume*) was to be found there, particularly onions, leeks, garlic, garden and water-cresses (*mastuerzo y berro*), borrague, sorrel, and artichokes (*cardo y tagarninas*). It would appear that no species of cabbage or turnip (*brassica et raphanus*) was cultivated in America.

Great numbers of farinaceous roots were also cultivated in Mexico and Peru.

The central table-land of Yutos produces in great abundance cherries, prunes, peaches, apricots, figs, grapes, melons, apples, and pears. In the environs of Mexico the villages and gardens yield in the months of June, July, and August fruit of most exquisite flavour, although the trees are in general very ill taken care of. In

* Mr. Waddy Thomson, alluding to fruits and vegetables, says "The apples and peaches of Mexico are not good, the latter decidedly inferior. The pears are very fine. They have one species of this fruit which is decidedly the best that I have ever seen; it is nearly the size of a goose-egg, and its flavour as delicious as that of the famous Philadelphia pear. All the fruits of the tropics—the orange, pine-apple, banana, mango, cherimoya, and last and least in size, but most exquisite in flavour, the *tuna*—are produced in Mexico to great perfection. It is the produce of one of the infinite varieties of cactus, of which I have seen twenty different varieties growing on an acre of land. One of these varieties runs up to the height of thirty or forty feet, in the form of a beautifully fluted column, and is used to enclose gardens, by planting close together. That which produces the *tuna* grows to the height of thirty feet, and covers an area of twenty feet in circumference, with the leaves (if leaves they may be called) dropping over each other like the shingles of a house. These leaves are exactly like those of the prickly pear on our mountains, only larger, generally of twelve or eighteen inches in breadth. The fruit is about the size, and very much the shape, of a duck's egg. The combined flavours of a water melon, a cucumber, and a lump of sugar-candy, will give some idea of this delicious and refreshing fruit, as it melts in the mouth. The cherimoya is a large fruit, and is altogether delicious. The idea which occurs to every one on eating it for the first time is, that it is a vegetable custard. I scarcely ever offered it to an American who did not make that comparison, thinking that he had said an original and smart thing; but I had heard it before at least a hundred times. They have a fruit very much like what we call the 'May-apple.'"

Mexico, Peru, and New Granada are found both the fruits of temperate Europe, and ananas, different species of *passiflora* and *tacsonia*, sapotes, mameis, goyavas, anonas, chilimoyas, and other rich productions of the torrid zone. The ecclesiastics, and especially the missionaries, contributed greatly to the early introduction of European fruits and vegetables. The gardens of the convents and of the secular priests were, in fact, nurseries, from which the recently imported vegetables were diffused over the country.

Bees'-wax is an article produced in great quantities. In the churches wax candles are perpetually burning, and are also used in processions.

Sugar was formerly an important article of production. The cane is cultivated in many districts. But, although it has been proved that it can be produced cheaper than by slave labour in Cuba, yet no great efforts are made to cultivate the sugar cane as an important branch of industry. It succeeds very well in most of the countries south of twenty-eight degrees. The most productive plantations are on the declivities of the table land, and in the lower plains, to the height of 5400 feet above the sea; but in many places well sheltered the sugar cane grows at an elevation of nearly 7000 feet. These plantations are most numerous in the valley of the Rio Santiago, and on the plains towards the Pacific. Their produce is very considerable, but nearly the whole of the sugar is consumed in the country.

From Vera Cruz there was exported annually more than half a million of arrobas of sugar, and M. Humboldt estimated the domestic consumption in Mexico at more than twice as much. Cuba, he says, in 1803 exported 2,576,000 arrobas of sugar, and used for her internal consumption 440,000 more. The export of sugar from the Havannah, from 1801 to 1810 inclusive, averaged 2,850,000 arrobas, or about 644,000 cwt. a year. Cotton, indigo, coffee, and cacao, have never been cultivated to any great extent in New Spain; though the Mexicans, like all other Spaniards, are great consumers of chocolate. Humboldt ascertained the quantity of cacao exported annually from the Spanish settlements, from 1799 to 1803, to be as follows;—from Venezuela and Maracaybo, 145,000 fanegas; from Cumana, 18,000; from New Barcelona, 5000; and from Guyaquil, 600,000; total, 228,000. But he omitted the delicate cacao of Guatemala. The vanilla sent to Europe was nearly all from the provinces of Oaxaca and Vera Cruz. Great care is required in drying this plant. Cochineal was formerly a production cultivated only in Mexico. Oaxaca furnished annually 32,000 arrobas of cochineal, valued at 2,400,000 dollars.

Very little silk is produced in Mexico; a company has lately been formed in order to cultivate the mulberry and breed silk-worms.

The annual produce of agriculture of New Spain was valued by Humboldt at 29,000,000 of dollars. This, like nearly all other estimates respecting this country, must be considered vague.

Of the obstacles to the improvement of agriculture, the excessive dryness of the climate is in many parts almost insuperable. Even the want of moisture in the ground, is usually attributed to the Spaniards, who cut down the forests in the interior of the country, and exposed the soil to the stronger action of the rays of the sun, which caused extraordinary evaporation. The extensive landed properties possessed by a few persons, held under all the strictness of Spanish entails, and the extensive tracts of country possessed in common, and therefore ill-cultivated and neglected, have been, and to a great degree continue to be, notwithstanding the rights of primogeniture have been abolished, the great impediments, coupled with indolence, to the successful cultivation of the soil.

Mr. Thompson informs us,—

“The immense estates of which I have spoken, of eighty and a hundred leagues square, with eighty or a hundred thousand cattle, and fifteen or twenty thousand mules and horses, yield very little profit. Perhaps not one acre out of ten thousand on these estates is cultivated. The grass is green all the year round, and their horses and cattle receive and seem to require no other food; they multiply as the birds do, and with little more profit to the proprietors of the estates. Now and then, the government purchases five hundred or a thousand horses for the army, but, with this exception, there are very few occasions when they can be sold. The average price for droves of unbroken horses is eight or ten dollars a head, and mules the same. The mules are generally small, but by no means too small for any service, nor smaller than those frequently used in this country. I have seen mules, however, in Mexico, as large as any I have ever seen elsewhere. The most of these are brought from California, and other departments north of Mexico; a pair of these large mules will sell for a thousand dollars, and that sum has frequently been paid for one fine saddle mule.

“In the villages the houses are generally small filthy hovels of ten or twelve feet square, built of unburnt bricks, with a small enclosure, in which the chili (red pepper), and a small patch of Indian corn for tortillas is cultivated. A Mexican village very closely resembles an American Indian village, with the difference that the Mexican hovels are built of brick instead of being log-cabins. The same idleness, filth, and squalid poverty are apparent.

“The road, for its entire extent from Vera Cruz to Jalapa, passes through the lands of General Santa Anna, which extend an immense distance on both sides of it: much of this land is of good quality, and would produce cotton and sugar most profitably. Very little of it is in cultivation, with the trifling exception of the chili and corn patches. General Santa Anna owns immense herds of cattle, some forty or fifty thousand head, which graze upon it. He also permits others to graze their cattle upon his lands for a rent which they pay him; I believe, forty dollars per annum for a hundred head.

“The system of agriculture in Mexico is, like every thing else, so wretchedly bad, that it is impossible to form any accurate opinion of the productiveness of the soil, the more especially as, on the whole route from Vera Cruz to Mexico, with the exception of a very few places, and for very short distances, there are no trees nor other natural growth but a few scrubby bushes, some palms, and the almost innumerable varieties of the cactus. The whole country is of manifestly volcanic formation, at least the upper strata. I have never been at any place where some species of lava was not presented, and in infinite varieties, some having very much the resemblance of cinders just taken from an iron furnace; others so entirely petrified, as to have little of the appearance of lava, except by their porousness. The soil is generally, I think, not very rich. In many places, such as the plain of which I have been speaking, the land is very good; nowhere, however, to be compared with our richest oak and hickory lands. The plough in universal use is that used two thousand years ago; neither more nor less than a wooden

wedge, without a particle of iron attached to it. The hoe is a wooden staff, with an iron spike in the end. What is still more remarkable, the only animal used in ploughing is the ox; a planter, with twenty thousand horses and mules (by no means an unusual number), will only use his oxen in the plough. If you ask why this is, the only answer I can give is, that the Spaniard never changes his habits, nor any thing else but his government. All the passion for change which exists in other men, with him is concentrated in political changes.

"It is this peculiar characteristic which has tended more than any and every other cause to produce the present degraded condition of Spain.

"As you approach the city of Puebla, there are farms of considerable extent on both sides of the road. The grains chiefly cultivated are wheat, barley, and Indian corn. The wheat is used for bread by the better classes, and I have never seen better bread anywhere. The Indian corn is used chiefly, I believe entirely, by the Mexicans in making tortillas. There is not a corn-mill in Mexico. The tortilla is the bread, and the only bread of the great mass of the people. The grain is softened by soaking it in water, it is then ground on a smooth stone, with a long roller made also of stone; and after mixing the due proportion—which is always a very large proportion of chili and some lime, it is spread out in a thin layer, and cooked as we do the hoe cake. Corn is not used at all as food for horses; the only grain used for that purpose is barley, and the only fodder is wheat straw—an article generally regarded by us as of little or no value for food. In this, I am satisfied that we are mistaken. I had a very large pair of American horses, and I was at first afraid that, however well the barley and wheat straw might agree with the Mexican horses, it was not substantial enough for mine. But I found that they became so fat upon it that I was obliged to curtail their allowance."

The wages of labour in New Spain are stated in Thompson's *Alcedo* to be $2\frac{1}{2}$ *reals de plata* a day, on the coast, and two *reals de plata*, or one-fourth of a dollar, on the table-land. This is only a vague estimate. Mr. Thompson considers the condition of the labourer as worse than that of the slave in the United States.* The average price of maize on the table-land, where it is the prin-

* The late minister of the United States at Mexico tells us: "There are a good many negroes in Vera Cruz; more probably than in any other part of Mexico. I did not see half-a-dozen negroes in the city of Mexico, in a residence there of two years, and very few mulattoes. It is a very great mistake to suppose they enjoy any thing like social equality even with the Indian population; and although there are no political distinctions, the aristocracy of colour is quite as great in Mexico as it is in this country; and the pure Castilian is quite as proud that he is a man without 'a cross,' as was *old Leatherstocking*, even if that cross should have been with the Indian race, however remote. The negro in Mexico, as everywhere else, is looked upon as belonging to a class a little lower than the lowest. . . the same lazy, filthy, and vicious creatures that they inevitably become where they are not held in bondage. *Bondage or barbarism seems to be their destiny*—a destiny from which the Ethiopian race has furnished no exception in any country for a period of time long enough to constitute an epoch. The only idea of the free negro of liberty in Mexico, or elsewhere, is exemption from labour, and the privilege to be idle, vicious, and dishonest; as to the mere sentiments of liberty, and the elevating consciousness of equality, they are incapable of the former; and, for the latter, no such equality ever did or ever will exist. There is a line which cannot be passed by any degree of talent, virtue, or accomplishment. The greater the degree of these, which, in rare individual instances, may exist, and the nearer their possessors may approach this impassable barrier, they are only the more miserable. This may be called prejudice, but it is a prejudice which exists wherever the Caucasian race is found; and nowhere is it stronger than in Mexico. The negro is regarded and treated there as belonging to a degraded caste equally as in the United States, much more so than in South Carolina, and in quite as great a degree as in Boston or Philadelphia.

"*Servitude*.—Whilst upon this subject it may not be inappropriate to allude to the system of servitude which prevails in Mexico—a system immeasurably worse for the slave, in every aspect, than the institution of slavery in the United States. The owners of the estates (*haciendas*) receive labourers into their service. These labourers are ignorant, destitute, half-naked Indians; certain wages are agreed upon, which the employer pays in food, raiment, and such articles as are absolutely necessary; an account is kept of all these things, and neither the labourer nor his family can

incipal food of the people, was estimated by Humboldt at five livres the fanega. The fanega is somewhat more than a bushel and a half. The ordinary price paid for wheat upon the farm, in New Spain, is about four or five dollars the carga or mule load, which weighs 150 kilograms; but the expense of carriage raises it in the city of Mexico to nine or ten dollars; the extreme prices being eight and fifteen. Mr. Ward states the prices more precisely, and says wheat is nearly twice as dear in the city of Mexico as it is in Paris; but wheat is not so much an article of the first necessity in Mexico as in France.

PRICES of Provisions, &c., to Housekeepers in the City of Mexico, as stated by Mr. Mayer.

PROVISIONS, &c.	Quantities and Prices.	PROVISIONS, &c.	Quantities and Prices.
MEATS.		Fruits—(continued.)	
Beef.....	12½ cents per 20 ounces.	Plantains.....	6½ cents for four.
Mutton.....	12½ " " 18 "	Grapes.....	25 " per lb.

Oranges.....	6½ " " six.		

ever leave the estate until all arrearages are paid. These, of course, he has no means of paying but by the proceeds of his labour, which being barely sufficient for his subsistence, he never can get free; and he is not only a slave for life, but his children after him, unless the employer chooses to release him from his service, which he often finds it convenient to do when the labourer becomes old or diseased. Whatever may be the theoretical protection from corporal punishment which the law affords him, the Mexican slave is, practically, no better off in this respect than is the African slave in this country. All the labourers in Mexico are Indians; all the large proprietors Spaniards, or of mixed blood. I say all; there may be a few exceptions, but they are very few of either. So of the army; the higher officers are all white men, or of mixed blood, the soldiers all Indians."

CHAPTER XXXVI.

MANUFACTURES.

SPAIN prohibited, but was unable altogether to prevent manufacturing industry in her colonies. The great extent, and populousness, of her foreign possessions,—the remoteness of the principal settlements from the coast,—the difficulty of transporting bulky commodities over the interior of America,—the want of industry and commercial enterprise in her subjects at home,—the almost exclusive attention of her government to the acquisition of the precious metals,—and the Spanish indifference, and ignorant contempt, for other sources of opulence,—all contributed to bring forward some fabrics in Mexico. Spain, it is true, recognised the existence of a few branches of manufacturing industry in her colonies,—but the policy was to sacrifice those at any time to the real, or supposed, interests of the mother country. About the middle of the eighteenth century an extensive plan for the establishment of European manufactures at Quito was proposed to the Spanish ministry, and undertaken with their consent and apparent approbation, but was defeated by secret instructions given to their agents in America; and in 1801 the manufactory of *Indian chintz* in Mexico was prohibited, lest it should interfere with the cotton manufactures of the peninsula. It must not, however, be forgotten that this was also the avowed policy of England; and that even Lord Chatham was its champion.* But neither the governments of England, nor of Spain, could prevent the colonies from manufacturing certain necessary articles.

The chief manufactures of Mexico under the Spanish government up to 1807 were woollens, cottons, gold and silver lace, hats, leather, soap, and earthenware; but the total value of the goods which they produced, according to Humboldt, was not more than 7,000,000 or 8,000,000 of dollars annually. Some trifling fabrics of silk were introduced since that time; and the manufactures increased considerably in consequence of the war with England and the interruption of

* Lord Chatham declared that he would not, if he could prevent them, allow the colonies to manufacture a horse-shoe nail. Mr. Thompson says, "The mechanical arts are in a low condition. Most of the articles of every description which are used there are brought from other countries, with the exception of plate, saddles, and a few others. Large quantities of plate are manufactured both for churches and individuals. I never saw a handsome piece, however, which was made there. They say that the saddlers of no other country can make a Mexican saddle. I do not think any decent saddler would if he could. There are two articles, however, which I believe have never been manufactured in any other country—the *reboso* (a long shawl worn by the women), and the *serape*, which is used all the year round by the men. The *reboso* is made either of cotton or silk, and sometimes one-half of each. Those made of cotton are most esteemed, and sell for the highest price. They sell for from twenty to fifty and a hundred dollars. If they could be made as other similar fabrics are, by European skill and machinery, they would not cost ten dollars. The *serape* is nothing more than a blanket, the warp of cotton and the filling of wool, with all the fantastical figures woven upon it which characterise the Indian taste for wampum and beads. They sell at from three dollars to three hundred. In summer or winter nearly every Indian you meet has one thrown over his shoulders, and in the rainy season no man rides five miles without one."

foreign commerce. Tobacco and gunpowder were royal manufactures and monopolies; and the former brought to the crown a clear revenue of 4,000,000 of dollars annually. Mexican artizans were said, by Von Humboldt, to be remarkably skilful in works of plate and jewellery; and, like some of the eastern nations, they had a singular turn for imitation; that very good carriages were made at Mexico, though the best coaches came from England. Mr. Thompson denies that they are skilful plate workers.

There were carriage-roads established by Spain from Mexico to most of the principal towns of the kingdom; but the transport of commodities has been chiefly effected, as in Old Spain, on the backs of mules. The new road from Perote to Vera Cruz was compared by Humboldt to the roads of the Simplon and Mont Cenis. It was going since then to ruin; but is in better condition, since the enterprising Americans have established diligences, driven also by Americans, between Vera Cruz and the city of Mexico.

Of the present state of manufactures in Mexico, Mr. Mayer gives the following statement:—

“A favourite mode,” he says, “of raising loans in Mexico, for the benefit of government, has been that of granting permits to merchants (chiefly Englishmen) to introduce cotton twist into the republic. This is a prohibited article—prohibited for the purpose of cherishing the manufacturing establishments of the country. That these have progressed to a very considerable extent, and have entirely outstripped the production of the cotton planters of Mexico, will be seen by the annexed table, which I have obtained from the most authentic sources:—

STATISTICS of Mexican Manufactures.

DEPARTMENTS.	Factories.	Spindles Established.	Spindles in Erection.	TOTAL.
	number.	number.	number.	number.
In Mexico.....	12	30,156	30,156
“ Puebla*.....	21	35,672	12,240	47,912
“ Vera Cruz.....	7	17,860	5,200	23,060
“ Guadalupe.....	5	11,312	6,500	17,812
“ Queretaro.....	3	7,620	7,620
“ Durango.....	4	2,520	2,520
“ Guanajuato.....	1	1,200	1,200
“ Sonora.....	1	1,000	1,000
Total.....	53	107,340	23,940	131,280

* Mr. Thompson says,—“Puebla is the Lowell of Mexico. The principal cotton manufactories are located there, and some of them in very successful operation, which can be said of very few others. The English and other foreign merchants had, in 1842, either by the force of argument or some more potential influence, induced the President to consent to the admission, on more favourable terms, of coarse cotton goods; but the united and violent opposition of the manufacturers of Puebla defeated the arrangement. I said that very few of these establishments in Mexico were prosperous, or ever have been, although the price of an article of cotton goods is in Mexico thirty cents a yard, which sells in the United States for six cents. This results from many causes, which appear insuperable. The first of these is the high price of the raw material, which ranges from forty to fifty cents per pound, and in such articles as coarse cottons, the raw material constitutes the chief element of value. The importation of raw cotton is absolutely prohibited, and the tariff policy in Mexico, as in all other countries, rests upon a combination of different interests which are benefited by it; and although neither the manufacturers nor the cotton growers constitute a numerous class in Mexico, yet their combined influence, with the aid of the catch-words ‘National independence, home industry,’ &c., which have had so much power in a much more enlightened country than Mexico, are all-sufficient to sustain the prohibitory system—by which a Mexican pays for one shirt a sum that would buy him five in any other

"It must be remarked, that there are three manufacturing establishments in the department of Durango, the number of spindles in which, are not included in the preceding table, because the *Junta de Industria* had not received very definite information respecting them. They may, however, be calculated at about 4000, which, added to the 131,280, will give a grand total of 135,000, at least. The number of looms, also, in the republic is not presented, because *data* have been furnished only in relation to those moved by machinery. An immense number of hand-loomers are in constant occupation throughout the republic.

COTTON FACTORIES.	Quantity.	Amount.	COTTON FACTORIES.	Quantity.	Amount.

			Produce of the country, as above....		50,000
			Leaving a deficit of.....		197,973½

* At the town of Lowell, alone, they make nearly 1,250,000 yards of cotton cloth per week, employ about 9000 operatives (6375 females), and use 433,000 lbs. of raw cotton per week. The annual amount of raw cotton used, is 22,568,000 lbs.; enough to load fifty ships, of 350 tons each; and of cotton manufactured, 70,275,910 yards: 100 lbs. of cotton will produce eighty-nine yards of cloth.

"It is true, that many persons have been induced by this condition of the market, and the prohibition of importing the raw material, to commence plantations of cotton; but we doubt whether the habits of the agricultural population will permit their prosperity. They dislike to adventure in new branches of industry. If their ancestors wrought on cotton plantations, they are content to continue in the same employment; but it will be difficult to train the new labourer to the newer cultivation. They adhere too closely to traditional occupations, and I have heard of some most signal failures, which have forced persons to abandon their establishments, after a considerable outlay of money in land and implements.

"The cotton crop of Mexico has been very variable in value. At Tepic, on the west coast, it has been as low as fifteen dollars the quintal; at Vera Cruz, on the east coast, twenty-two dollars and thirty-four dollars; while at Puebla, and in the capital, it has risen to forty dollars, and even forty-eight dollars.

"In spite of all the efforts of English capitalists and diplomacy, the government has steadily persevered in fostering the manufactures of the republic, except by the occasional allowances of the importation of *twist*. The administration of Santa Anna, however, has been energetic, I am informed, both in its opposition to the introduction of this article,

country. Another immense disadvantage of the Mexican manufacturer is, that all his machinery is transported by land at enormous cost—and when any portion of it gets out of order, the difficulty and delay of repairing it, and the consequent loss are incalculable. However tempting to such an investment may be the high prices of the manufactured articles, those high prices are equally tempting to smuggling in a country with 10,000 miles of frontier and sea-board. There is, perhaps, no other country where the receipts of the custom-house are so little to be relied on as to the amount of importations, and where smuggling is carried to so great an extent; even where goods are regularly imported, innumerable frauds are practised both by and upon the custom-house officers."

and in its effects to suppress the smuggling of English and American fabrics. The manufacturers, therefore, regard their establishments as perfectly safe, and their future success as certain."

The average price of *mantas* (cotton cloth), of one *vara* width, in 1842, was about twenty-five cents the *vara*: and of *twist*, No. 12 to 22, about seventy-five cents the pound. It was estimated, that if cotton fell in consequence of importations being allowed, or a large crop, to twenty-five dollars the quintal, these articles would be reduced to eighteen and three-quarters cents the *vara* for the first, and to fifty cents the pound for the second. This condition of the market would prevent all importations from abroad, even aided by smuggling.*

"An intelligent merchant of the city of Mexico, who has resided long in the country, and has an extensive acquaintance in the republic, informs me that there are about 5000 hand-loom throughout the departments, which will work up all the spun yarn into *mantas* and *rebosos* as fast as it can be made. Many of these looms are entirely employed in the manufacture of the common *rebosos* the consumption of which is so great among the poorer classes. The value of these looms is estimated at between 6,000,000 dollars and 7,000,000 dollars. The number of persons employed, in every way in manufactures, cannot be much short of 30,000.

"The power made use of for the movement of the factories is water; which is abundant for that purpose, all over the country, proceeding from small streams falling from the mountains into the neighbouring plains or barrancas. Owing to the scarcity of wood, and the costliness of its transportation, steam cannot be advantageously applied.

"There are several manufactories of cotton balls, or thread, in Mexico, but they are not of very great importance.

"Paper factories are working with considerable success. There are two near the capital, one at Puebla, and one in Guadalupe. Their productions are very good, but by no means adequate to the consumption of the country. The quantity of this article used for *cigarritos*, or paper cigars, is inconceivable. The best coarse wrapping or envelope paper, I have ever seen, is made in Mexico from the leaves of the *Agave Americana*, the plant which yields "pulque." It has almost the toughness and tenacity of iron.

"Both at Puebla and Mexico there are several glass factories, making large quantities of the material for windows and common tumblers. Their produce is, nevertheless, insufficient for the wants of the country.

* "I have before remarked that enough cotton is not raised to supply the very limited demand of the Mexican manufacturers. The most of this is produced in the districts which lie upon the Pacific Ocean, but the climate of nearly all Mexico is suited to the growth of cotton. I can see no reason why it is not produced in much larger quantities, bearing, as it does, so enormous a price, except the characteristic indolence of the people. I have no data from which to form even a conjecture of the number of yards of coarse cottons which are annually manufactured in Mexico. It is estimated that 8,000,000 of dollars are invested in these manufactories. From that fact those skilled in such matters may be able to form some estimate of the quantity manufactured. It would be well, however, in making such an estimate to consider that the same machinery could be put up in this country at one-third of what it has cost in Mexico, and that an establishment in which the managers and operatives were Americans would probably make at least five yards for one. With the exception of a few of the manufactories in Puebla the business of manufacturing cotton has not been profitable in Mexico. One or two Americans have gone there and attempted it, but their experiments have ended in bankruptcy. A more striking proof of the unconquerable repugnance of the Mexican to labour cannot be given than the fact that short staple cotton sells there at from forty to forty-five cents per pound, while they have lands and climate as well adapted to its culture as ours, and these lands dirt cheap; yet they never make enough for their own small consumption. The importation of cotton is positively forbidden by law; but this law is often relaxed, by selling the privilege to mercantile companies to import a certain number of bales. If such prices could be obtained at home, our northern people would discover some plan of raising it profitably in hot-houses. Although the whole road from the city of Vera Cruz to the city of Mexico passes through a country inexpressibly picturesque and beautiful, yet the ignorant, idle, and degraded population, the total absence of cultivation and improvement, and a general appearance of wildness and desolation, produced in me feelings partaking of gloom and melancholy. Neither in going nor returning did I see one human being, man, woman, or child, engaged at work of any sort. The great mass of the population doze out their lives with no higher thoughts or purposes than the beasts which perish around them."

“Woollen blankets, and some very coarse woollen cloths or *baizes*, are also manufactured in the republic. The blankets are often of beautiful texture, and woven, with the gayest colours and patterns, into a garment that frequently costs a fashionable cavalier from two to five hundred dollars. As this is as indispensable an article for the comfort of a lépero as of a gentleman, and as necessary for a man as a reboso is for a woman, you may readily imagine how great is the consumption.

“Such is a sketch of this branch of industry, to which the government and people seem to have devoted themselves with a hearty will. We have dwelt at considerable length upon it, as evincing an energy and temper not usually attributed to Mexicans, and for the purpose of exhibiting a phase of character at once creditable to their resolution and manifesting a degree of independence and thriftiness worthy of imitation.”

Several failures have occurred in the cotton factories of Mexico. The prohibitory system is persevered in; and the prices of cotton cloths, especially, are enormously high. Mr. Thompson has a far less favourable opinion than Mr. Mayer of the manufactures of this republic.

CHAPTER XXXVII

COMMERCE OF MEXICO UNDER THE SPANISH GOVERNMENT.

THE commerce of New Spain with the mother country was carried on almost entirely through Vera Cruz. In time of peace, Mr. Humboldt estimated the annual value of the exports, in that commerce, at 22,000,000 of dollars, and the annual value of the imports at 15,000,000 dollars. His statement of the articles are as follows:—

EXPORTS.	Dollars.	IMPORTS.	Dollars.
Gold and silver, in coin, bullion, and plate ..	17,000,000	Bale goods, including woollens, cottons, linens, and silks	9,200,000
Cochineal.....	2,400,000	Paper	1,000,000
Sugar.....	1,300,000	Brandy.....	1,000,000
Flour.....	300,000	Cacao.....	1,000,000
Indigo, being the produce of Nuevo Espana..	280,000	Quicksilver.....	650,000
Salt meat and other provisions	100,000	Iron, manufactured and unmanufactured....	600,000
Tanned hides.....	80,000	Steel.....	200,000
Sarsaparilla	90,000	Wine.....	700,000
Vanilla.....	60,000	Bees'-wax	300,000
Jalap.....	60,000		
Soap.....	50,000		
Logwood.....	40,000		
Pimento	30,000		
	21,790,000		14,600,000

This statement, however, must be considered as a mere approximation, which Humboldt, founded on the average of several years of peace, and therefore more applicable to the period antecedent to 1796, when the war with England broke out. Humboldt does not include, in this estimate, the contraband trade on the sea coast, and he has also omitted the indigo imported from Guatemala, and the *cacao* of Guayaquil, though exported from Vera Cruz, because these articles were not the produce of that kingdom.

The difficulty of intercourse at times was so great, that from Acapulco to Lima the passage was sometimes longer than from Lima to Cadiz. Mexico and Peru, though at no great distance, were therefore incapable of maintaining any considerable commerce with each other. The old Acapulco Manilla ship arrived

once a year at Acapulco with a cargo of Indian goods, valued at 1,200,000 or 1,300,000 dollars, and carried back silver in exchange, with a very small quantity of American produce, and some European goods.

The last *flota*, under the old system, sailed from Vera Cruz in 1778, and exported the produce of the four preceding years, which amounted in value to

	Dollars.
The exports of produce in 1787—90, the four first years after the new system was completely established, were valued at.....	2,470,022
Difference of the four years.....	11,394,664
Export of produce in { 1802.....	8,924,642
{ 1803.....	9,188,212
	5,128,283

The export of 1802 was not, probably, a fair comparison, as *that* was the first year of peace after the termination of a long war, in which the direct commerce with Spain had been in a great measure suspended. In 1803, the value of exports was more than double that of four years under the old system, and nearly equal to the exports of two years immediately after the introduction of a more open trade. This open trade must not be considered either a free trade, or a trade with a foreign country. It meant, in fact, an open trade with Spain. The trade with foreign countries was really *open* only after 1808, and it is now nearly closed by a prohibitory tariff.

Humboldt gives the following estimate of the total amount, including the contraband:

	Dollars.
Annual value of importation of goods.....	20,000,000
— exportation of produce	6,000,000
Balance to be discharged in money.....	14,000,000
Annual produce of the mines.....	23,000,000
Export of money on account of the crown, and of private individuals residing in Spain.....	8,000,000
Export to discharge the balance of trade.....	14,000,000
Money added to the circulation of the colony.....	1,000,000
	23,000,000

According to Humboldt, the dollars imported into Nueva Espana and Guatemala, in 1803, amounted to 22,000,000; and the exports consisted of produce to the value of 9,000,000 dollars, besides 22,500,000 dollars in specie.

The commerce of Mexico has been diminishing for the last eighteen years. This is attributable to the continual revolutionary disturbances of the country, the decrease of the wealth of the people, and the pecuniary embarrassments to which most of the inhabitants have been subjected, by the non-payment of government loans, and of unfortunate investments.

In 1832 and 1833, the revenue of the custom house amounted to about 12,000,000 per annum. In 1839, on account of the French blockade, it fell to nearly 3,000,000; in 1840, it rose again to 7,000,000; and, in the following year, fell to little more than 5,000,000 which sum may be divided among the different ports as follows, to wit:

	Dollars.
Vera Cruz.....	3,329,802
Tampico.....	883,039
Matamoras.....	312,403
Marattan.....	383,159
Guyamas.....	55,914
Monterrey.....	96,853
Acapulco.....	17,182
San Blas.....	208,845

5,287,097

This corresponds to about 12,300,000 dollars' value of importation annually divided (according to an estimate), in the following manner:—

	Dollars.
From England	4,500,000
" France	3,000,000
" Hamburg	1,500,000
" China	1,000,000
" United States	800,000
" Spain	500,000
" Genoa and other ports	1,000,000
	<hr/> 12,300,000

The expense to the government, for the collection of this revenue, was 348,290 dollars. These statements are exclusive of the contraband trade from the United States by Santa Fé, and by the English and Americans by the sea-coasts.

The exports from the whole republic (chiefly its own productions), may be rated as follows, viz.:—

E X P O R T S.		Amount.
		dollars.
Precious metals..	{ Specie, through Vera Cruz	4,000,000
	" " Mazatlan and San Blas	2,500,000
	{ Silver and gold, through other ports	5,000,000
	{ Silver, through Tampico	7,000,000
Cochineal, jalap, vanilla, sarsaparilla, and hides		1,000,000
Sundries		500,000
Total		20,000,000

From this estimate, about 18,500,000 dollars in the precious metals, are exported annually from Mexico. The mines produce near 22,000,000 of silver, of which, it is calculated, that 12,000,000 are coined in the seven mints of the republic per annum. There is a difference of about 8,000,000 dollars between he imports and exports, a large portion: all which is estimated to be covered by smuggling.

The following comparative estimate of the exports and imports of the United States and of Mexico, for the years 1841 and 1842, cannot fail to be interesting in this connexion, especially when the comparative extent of territory and population is taken into consideration:

E X P O R T S.	Amount.	Amount.
	dollars.	dollars.
Exports from Mexico in 1842	20,000,000
Of which, in gold and silver	18,500,000
Balance in other products of industry	1,500,000
Excess of imports over the industrial exports, exclusive of the precious metals	10,500,000
Imports of the United States in 1841—2	99,357,329
Exports from " " " "	104,117,969
Difference	4,760,640
Exports of gold and silver	9,805,235
Of which was the produce of U. S. Mines	2,746,486	
" foreign gold	677,297	
" foreign silver	6,381,452	
Total	9,805,235	
Total exports from the United States	104,117,969]
Deduct exports of the precious metals	9,805,235
		94,312,734

The United States exported 94,312,734 dollars' value, representing her industry (exclusive of gold and silver), while Mexico, with a territory nearly as large, exported but 1,500,000 dollars. In addition to this, it must be recollected, that but 2,746,846 dollars of the precious metals were the product of the United States, while at least 15,000,000 dollars were the product of the Mexican mines; leaving an excess of nearly 3,000,000 above the total annual coinage of the nation.

	dollars.
Whole value of exports, say for 8,000,000 inhabitants . . .	20,000,000
" " 17,000,000 " . . .	104,117,969

This will give the ratio of about 6 dollars 12½ cents for each person in the United States, and 2 dollars 50 cents for each person in Mexico.

The contraband trade of Mexico has been carried on there with the utmost audacity; statistical returns must therefore be imperfect.

TRADE OF THE SEA PORTS.

We have observed that there are no great navigable rivers, and few good harbours. Not a mile of any Mexican river is navigated by steamboats. Probably not 600 miles of all the rivers in the empire could be navigated by the smallest steam vessels—nor is there a railroad in Mexico. It is asserted that there is not one in any country in which the Spanish language was spoken. We believe not one in 1846. Nearly all European trade passes through Vera Cruz and Tampico. The backs of mules are the means of transport.

PORT OF VERA CRUZ.—This port is far from being a good harbour. It is rather a roadstead. The little island of St. Juan de Ulloa, which is entirely covered with the immense fortress, is 500 or 600 yards from the mole of Vera Cruz, between which points all the commercial shipping anchors. It frequently occurs that violent north winds (called "los nortes," or northers) drive the vessels on shore, and even seriously damage the mole. The anchorage is bad. There is a brilliant revolving light, eighty feet above the level of the sea, on the north-west point of the island. Foreign ships of war anchor about three miles below, near the island of Sacrificios. A very narrow channel affords the only passage for ships of war, which must consequently pass immediately under the guns of the fort. The fortress of St. Juan de Ulloa has always been considered as one of the strongest in the world. When it was blown up in 1839, by the French, its garrison was wretched. Even then it would not have been so readily taken had it not been for the accidental explosion of the powder magazine. It is at present, August, 1846, blockaded by the United States. Mr. Thompson says,

"Vera Cruz is much more effectually protected than by all her fortifications, by the northers and vomito (the yellow fever). The former have been the terror of all seamen since the discovery of the country. The latter prevails on all the Atlantic coast of Mexico during the whole year, and with the greatest malignancy, for two-thirds of the year; and it so happens, that the few months of comparative exemption from the ravages of the yellow fever are precisely those when the *northers prevail* with the most destructive violence.

"I can see no advantage which could be gained by getting possession of Vera Cruz

which would be at all commensurate with the loss of life, from disease alone, in retaining it. It is not the only port which Mexico possesses ; and if it were, there is no country in the world which would be so little injured by cutting off all its foreign commerce, for there is no single want of civilised man which Mexico is not capable of furnishing. The town, it is true, might be destroyed, and heavy losses and much individual suffering be caused, but these are amongst the painful and deplorable consequences, not the legitimate objects of honourable war."

The present city of Vera Cruz is not the same which was built by Cortez in 1519, and which was the first European settlement in America. The *Villa Rica de la Vera Cruz*, the rich town of the true cross, is distant about six miles from the present city. Vera Cruz is described as rather a neatly built town, with broad and tolerably clean streets.

Mr. Thompson, who gives the last account of it, says,

"It would no doubt be as healthy as any other place in the same latitude and climate, if it were not for some large swamps in the rear of the city. The vomito is by no means the only, nor do I think it the most fatal of the diseases which prevail there. The bills of mortality in some years exhibit a great number of deaths from some other diseases, whilst in other years much the greatest number die of vomito."

COMMERCE of the Port of Vera Cruz.

REMARKS.— The value of foreign importations cannot be obtained at the custom-house, where no account of them is kept ; nor are foreign merchants at all disposed to give any such information.

The PORT OF TAMPICO has a bar at both the entrance of Boca del Rio and Brazo de Santiago, and they only admit small brigs and lesser vessels; but the rivers which flow into the lagoon are to some extent navigable. It is quite or nearly as unhealthy as Vera Cruz.

FOREIGN Trade of Tampico, from the 1st of January to the 31st of December, 1841.

* Chiefly specie.

† Including specie.

The PORT OF MATAMOROS is formed by the Rio Bravo del Norte, and is forty miles distant from the town, where the custom-house is. There are two harbours, viz., the

Brazo de Santiago, and the Boca del Rio ; which latter is about nine miles to the southward of the former. Both are obstructed by a bar ; that of the Brazo having usually from eight to ten feet water over it ; and that of the Boca del Rio, from four to six feet. These bars are impassable during any strong wind. The anchorage in both harbours is fair, in three to five fathoms ; but there is no perfect security for vessels during the gales so frequent in August and September. Vessels cannot come up the river to the town. In the Brazo, they unload by means of lighters ; and in the Boca del Rio, they discharge on the banks of the river. The tide rises and falls but a few inches.

There is no lighthouse, and the coast is very flat. The best indication to an arriving vessel of her proximity to the port, is the discolouration of the water caused by the river, and which extends to some distance at sea.

On the arrival of a vessel off either harbour, the pilot goes out to her, if the bar be not too rough. A custom-house officer receives all the papers, giving to the captain a receipt for the same.

The whole trade of Matamoras in 1841, was carried on in vessels from the United States—Vessels, 32 ; tonnage, 2345.

Exchange of Money, Weights, and Measures.—1 dollar = 8 rials, 1 rial = 2 medios.

The currency of the place, "*dinero provisional*," although it consists precisely of the same denominations, is worth $2\frac{1}{2}$ per cent less than the new Mexican dollar, which is the only coin exported or received at the Custom-house. That is to say, $2\frac{1}{2}$ per cent is the premium paid on the spot, in exchanging one for the other. But the difference between the intrinsic value of the two coins is, I understand, much greater.

1 quintal = 4 arrobas = 100 lbs. Spanish; 100 Spanish lbs. = 101.75 lbs. English.

1 vara = 36 inches, 108 varas = 100 English yards.

Pilotage.—At the Boca del Rio, five dollars per foot draught of water. At the Brazo de Santiago, three dollars per foot draught of water.

A bill of health is always required.

Charges and Dues for Lights, Buoys, Quays, Wharfs, &c.—None.

PORTS OF THE PACIFIC.

ACAPULCO, or LOS REYES, is situated on the coast of the South Sea. Its inhabitants formerly consisted of nearly 400 families of Chinese, mulattoes, and negroes. The greater part of the town is on the sea-shore. The air is extremely hot and moist, independent of its being in the torrid zone, it is entirely shut out from the north winds, being surrounded by lofty *serrania*. These circumstances render it very unhealthy, especially in the wet season, on account of the damps and sea-winds blowing from the south-east to the great detriment of the inhabitants and merchants who come to trade here; this being the principal cause why scarcely any Spanish families ever resided here. Owing to the barren state of the land it is forced to seek its necessary supplies from the Indian settlements. The only commerce which it can be said to have ever had was a fair, held on the arrival of the galleons formerly from China; and when those departed there were no other means for the people of maintaining a trade. At the distance of a musket-shot, and on a promontory running far into the sea, is situate the castle and royal fort of San Diego, mounted with artillery. The port is safe, and so spacious that 500 ships can lay at anchor in it with ease. It is surrounded by lofty rising grounds. Its principal mouth is on the south side, formed by an

island of an oblong figure, and somewhat inclining to the south-west. The same island forms also another mouth, which they call chica, or little. The canals on either side of the island are twenty-five fathoms deep. The chief trade of Acapulco was its commerce with Manilla. Lat., according to Humboldt, 16 deg. 50 min. 29 sec.; long. by ditto, 99 deg. 46 min. Lat., according to the Spaniards, 16 deg. 50 min. 30 sec.; long. by ditto, 100 deg. Both longitudes being measured from the meridian of Greenwich.

The Ports of SAN BLAS and MAZATLAN are the other principal ports; as harbours, neither are good. We have already given all the information we could obtain relative to the ports and trade of San Francisco and California.

Gross Return of British and Foreign Trade at the principal Ports within the Consulate of San Blas during the Year ending the 31st of December, 1845.

Matamoras.....	1½	gratification to pilot 16½	6	8
San Blas.....	1½	16, and for shifting their ship each time, 4
Mazatlan.....							
Guyamas.....	1½

REMARKS.—Whether a ship takes a pilot or not, the pilotage money is exacted on foreign shipping. The charge for ballast is exorbitant, and presses severely on owners of foreign vessels. The supply for ballast is a monopoly in the hands of barge proprietors. No foreign ship is allowed to convey its own ballast from the beach, which is all sand, and superabundant. Could the Mexican government be prevailed on to permit

each ship to ballast with its own boats, it would have the effect of reducing the price of ballast, and would prove a great relief to British ship owners. Vouchers are not given in all cases. Vouchers are here given only on water dues, pilotage, and bill of health; the exceptions being on tonnage duty, fees to captain of the port, and stamps. There are no lights on the coast in this vicinity. Any assistance afforded to vessels in distress is an enormous and extra charge, at the will or caprice of the solitary pilot establishment at the bar, which is not under the control of the government. Vouchers are given by the custom-house on payment of the tonnage duty, and for the captain of the port for fees levied by him.

The dues here specified are exacted on all foreign vessels whatever, and under every circumstance, whether loaded or in ballast, when calling for orders or for supplies. Every vessel letting go her anchor in the harbours or roadstead, even if there is no cargo on board, is subject to these dues; and if loaded the cargo must all be discharged, whether destined for that port, or any other place whatever. There are no light-houses, buoys, or moorings, nor any establishment of pilots on the west coast of Mexico; nor are any services rendered or advantages existing which would warrant the exorbitant tonnage dues and charges exacted.

No advantages are enjoyed by foreign vessels from which British vessels are excluded. Mexican vessels employed in the coasting trade are exempted from all the charges specified in this statement. No foreign vessels are permitted to carry on the coasting trade.

BRITISH CONSULATE, *Mexico*, 30th of May, 1845.

No country imposes such enormous charges on shipping as Mexico. For instance:

JAMES WILLIAM GLASS, (*Consul*).

CHAPTER XXXVIII.

TREATIES OF AMITY, COMMERCE, AND NAVIGATION, BETWEEN THE GOVERN-
MENT OF THE UNITED STATES AND THE GOVERNMENTS OF THE SPANISH
AMERICAN REPUBLICS.*Treaty with the United States of Mexico.*

ARTICLE I.—There shall be perpetual amity between the dominions and subjects of his Majesty, the King of the United Kingdom of Great Britain and Ireland, and the United States of Mexico, and their citizens.

ARTICLE II.—There shall be, between all the territories of his Britannic Majesty in Europe and the territories of Mexico, a reciprocal freedom of commerce. The inhabitants of the two countries respectively, shall have liberty freely and securely to come, with their ships and cargoes to all places, ports, and rivers in the territories aforesaid, saving only such particular ports to which other foreigners shall not be permitted to come, to enter into the same, and to remain and reside in any part of the said territories respectively; also to hire and occupy houses and warehouses for the purposes of their commerce; and, generally, the merchants and traders of each nation, respectively, shall enjoy the most complete protection and security for their commerce.

In like manner, the respective ships of war, and post-office packets of the two countries, shall have liberty freely and securely to come to all harbours, rivers, and places, saving only such particular ports (if any) to which other foreign ships of war and packets shall not be permitted to come, to enter into the same, to anchor, and to remain there and refit; subject always to the laws and statutes of the two countries, respectively.

By the right of entering the places, ports, and rivers mentioned in this article, the privilege of carrying on the coasting trade is not understood, in which national vessels only are permitted to engage.

ARTICLE III.—His Majesty the King of the United Kingdom of Great Britain and Ireland, engages further, that the inhabitants of Mexico shall have the like liberty of commerce and navigation stipulated for in the preceding article, in all his dominions situated out of Europe, to the full extent in which the same is permitted at present, or shall be permitted hereafter, to any other nation.

ARTICLE IV.—No higher or other duties shall be imposed on the importation into the dominions of his Britannic Majesty, of any article of the growth, produce, or manufacture of Mexico, and no other or higher duties shall be imposed on the importation into the territories of Mexico, of any articles of the growth, produce, or manufacture of his Britannic Majesty's dominions, than are or shall be payable on the like articles, being the growth, produce, or manufacture of any foreign country; nor shall any other or higher duties or charges be imposed in the territories or dominions of either of the contracting parties, on the exportation of any articles to the territories of the other, than such as are or may be payable on the exportation of the like articles to any other foreign country; nor shall any prohibition be imposed upon the exportation of any articles the growth, produce, or manufacture of his Britannic Majesty's dominions, or of the said territories of Mexico, to or from the said dominions of his Britannic Majesty, or to or from the said territories of Mexico, which shall not equally extend to all other nations.

ARTICLE V.—No higher or other duties or charges on account of tonnage, light or harbour dues, pilotage, salvage in case of damage or shipwreck, or any other local charges, shall be imposed, in any of the ports of Mexico, on British vessels, than those payable, in the same ports, by Mexican vessels; nor, in the ports of his Britannic Majesty's territories, on Mexican vessels, than shall be payable, in the same ports, on British vessels.

ARTICLE VI.—The same duties shall be paid on the importation into the territories of Mexico, of any article the growth, produce, or manufacture of his Britannic Majesty's dominions, whether such importation shall be in Mexican or in British vessels; and the same duties shall be paid on the importation into the dominions of his Britannic Majesty, of any article the growth, produce, or manufacture of Mexico, whether such importation shall be in British or in Mexican vessels. The same duties shall be paid, and the same bounties and drawbacks allowed, on the exportation to Mexico of any articles of the growth, produce, or manufacture of his Britannic Majesty's dominions, whether such exportation shall be in Mexican or in British vessels; and the same duties shall be paid, and the same bounties and drawbacks allowed, on the exportation of any articles the growth, produce, or manufacture of Mexico, to his Britannic Majesty's dominions, whether such exportation shall be in British or in Mexican vessels.

ARTICLE VII.—In order to avoid any misunderstanding with respect to the regulations which may respectively constitute a British or Mexican vessel, it is hereby agreed that all vessels built in the dominions of his Britannic Majesty, or vessels which shall have been captured from an enemy by his Britannic Majesty's ships of war, or by subjects of his said Majesty, furnished with letters of mark by the Lords Commissioners of the Admiralty, and regularly condemned in one of his said

Majesty's prize courts as a lawful prize, or which shall have been condemned in any competent court for the breach of the laws made for the prevention of the slave-trade, and owned, navigated, and registered according to the laws of Great Britain, shall be considered as British vessels : and that all vessels built in the territories of Mexico, or captured from the enemy by the ships of Mexico, and condemned under similar circumstances, and which shall be owned by any citizen or citizens thereof, and whereof the master and three-fourths of the mariners are citizens of Mexico, excepting where the laws provide for any extreme cases, shall be considered as Mexican vessels.

And it is further agreed, that every vessel, qualified to trade as above described, under the provisions of this treaty, shall be furnished with a register, passport, or sea-letter, under the signature of the proper person authorised to grant the same, according to the laws of the respective countries (the form of which shall be communicated), certifying the name, occupation, and residence of the owner or owners, in the dominions of his Britannic Majesty, or in the territories of Mexico, as the case may be ; and that he, or they, is, or are, the sole owner or owners, in the proportion to be specified ; together with the name, burden, and description of the vessel, as to build and measurement, and the several particulars constituting the national character of the vessel, as the case may be.

ARTICLE VIII.—All merchants, commanders of ships, and others, the subjects of his Britannic Majesty, shall have full liberty, in all the territories of Mexico, to manage their own affairs themselves, or to commit them to the management of whomsoever they please, as broker, factor, agent, or interpreter ; nor shall they be obliged to employ any other persons for those purposes than those employed by Mexicans, nor to pay them any other salary or remuneration than such as is paid, in like cases, by Mexican citizens ; and absolute freedom shall be allowed, in all cases, to the buyer and seller, to bargain and fix the price of any goods, wares, or merchandise, imported into, or exported from Mexico, as they shall see good, observing the laws and established customs of the country. The same privileges shall be enjoyed in the dominions of his Britannic Majesty, by the citizens of Mexico, under the same conditions.

The citizens and subjects of the contracting parties, in the territories of each other, shall receive and enjoy full and perfect protection for their persons and property, and shall have free and open access to the courts of justice in the said countries, respectively, for the prosecution and defence of their just rights ; and they shall be at liberty to employ, in all causes, the advocates, attorneys, or agents of whatever description, whom they may think proper ; and they shall enjoy, in this respect, the same rights and privileges therein, as native citizens.

ARTICLE IX.—In whatever relates to the succession to personal estates, by will or otherwise, and the disposal of personal property of every sort and denomination, by sale, donation, exchange, or testament, or in any other manner whatsoever, as also the administration of justice, the subjects and citizens of the two contracting parties shall enjoy, in their respective dominions and territories, the same privileges, liberties, and rights, as native subjects ; and shall not be charged, in any of these respects, with any higher imposts or duties than those which are paid, or may be paid, by the native subjects, or citizens of the power in whose dominions or territories they may be resident.

ARTICLE X.—In all that relates to the police of the ports, the lading and unlading of ships, the safety of merchandise, goods, and effects, the subjects of his Britannic Majesty, and the citizens of Mexico, respectively, shall be subject to the local laws and regulations of the dominions and territories in which they may reside. They shall be exempted from all compulsory military service, whether by sea or land. No forced loans shall be levied upon them ; nor shall their property be subject to any other charges, requisitions, or taxes, than such as are paid by the native subjects or citizens of the contracting parties in their respective dominions.

ARTICLE XI.—It shall be free for each of the two contracting parties to appoint consuls for the protection of trade, to reside in the dominions and territories of the other party : but, before any consul shall act as such, he shall, in the usual form, be approved and admitted by the government to which he is sent ; and either of the contracting parties may except from the residence of consuls such particular places as either of them may judge fit to be excepted. The Mexican diplomatic agents and consuls shall enjoy, in the dominions of his Britannic Majesty, whatever privileges, exceptions, and immunities are or shall be granted to agents of the same rank belonging to the most favoured nation : and, in like manner, the diplomatic agents and consuls of his Britannic Majesty in the Mexican territories shall enjoy, according to the strictest reciprocity, whatever privileges, exceptions, and immunities are or may be granted to the Mexican diplomatic agents and consuls in the dominions of his Britannic Majesty.

ARTICLE XII.—For the better security of commerce between the subjects of his Britannic Majesty and the citizens of the Mexican states, it is agreed that if, at any time, any interruption of friendly intercourse, or any rupture should unfortunately take place between the two contracting parties, the merchants residing upon the coasts shall be allowed six months, and those of the interior a whole year, to wind up their accounts, and dispose of their property ; and that a safe conduct shall be given them to embark at the port which they shall themselves select. All those who are established in the respective dominions and territories of the two contracting parties, in

the exercise of any trade or special employment, shall have the privilege of remaining and continuing such trade and employment therein, without any manner of interruption, in full enjoyment of their liberty and property, as long as they behave peaceably, and commit no offence against the laws; and their goods and effects, of whatever description they may be, shall not be liable to seizure or sequestration, or to any other charges or demands than those which may be made upon the like effects or property, belonging to the native subjects or citizens of the respective dominions or territories in which such subjects or citizens may reside. In the same case, debts between individuals, public funds, and the shares of companies, shall never be confiscated, sequestered, or detained.

ARTICLE XIII.—The subjects of his Britannic Majesty, residing in the Mexican territories, shall enjoy, in their houses, persons and properties, the protection of the government; and, continuing in possession of what they now enjoy, they shall not be disturbed, molested, or annoyed in any manner, on account of their religion, provided they respect that of the nation in which they reside, as well as the constitution, laws, and customs of the country. They shall continue to enjoy, to the full, the privilege already granted to them of burying, in the places already assigned for that purpose, such subjects of his Britannic Majesty as may die within the Mexican territories; nor shall the funerals and sepulchres of the dead be disturbed in any way, or upon any account. The citizens of Mexico shall enjoy, in all the dominions of his Britannic Majesty, the same protection, and shall be allowed the free exercise of their religion, in public or private, either within their own houses, or in the chapels and places of worship set apart for that purpose.

ARTICLE XIV.—The subjects of his Britannic Majesty shall, on no account or pretext whatsoever, be disturbed or molested in the peaceable possession and exercise of whatever rights, privileges, and immunities they have at any time enjoyed within the limits described and laid down in a convention, signed between his said Majesty and the King of Spain, on the 14th of July, 1786; whether such rights, privileges, and immunities shall be derived from the stipulations of the said convention, or from any other concession which may at any time have been made by the King of Spain, or his predecessors, to British subjects and settlers residing and following their lawful occupations within the limits aforesaid: the two contracting parties reserving, however, for some more fitting opportunity the further arrangements on this article.

ARTICLE XV.—The government of Mexico engages to co-operate with his Britannic Majesty for the total abolition of the slave-trade, and to prohibit all persons inhabiting within the territories of Mexico, in the most effectual manner, from taking any share in such trade.

ARTICLE XVI.—The two contracting parties reserve to themselves the right of treating and agreeing hereafter, from time to time, upon such other articles as may appear to them to contribute still further to the improvement of their mutual intercourse, and the advancement of the general interests of their respective subjects and citizens; and such articles as may be so agreed upon, shall, when duly ratified, be regarded as forming a part of the present treaty, and shall have the same force as those now contained in it.

ARTICLE XVII.—The present treaty shall be ratified, and the ratifications shall be exchanged at London, within the space of six months, or sooner if possible.

In witness whereof the respective plenipotentiaries have signed the same, and have affixed thereto their respective seals.

Done at London, the twenty-sixth day of December, in the year of our Lord one thousand eight hundred and twenty-six.

(L.S.) WILLIAM HUSKISSON.
(L.S.) JAMES J. MORIER

Additional Articles.

ARTICLE I.—Whereas, in the present state of Mexican shipping, it would not be possible for Mexico to receive the full advantage of the reciprocity established by the Articles V., VI., VII. of the Treaty signed this day, if that part of the VIIth Article which stipulates that, in order to be considered as a Mexican ship, a ship shall actually have been built in Mexico, should be strictly and literally observed, and immediately brought into operation—it is agreed that, for the space of ten years, to be reckoned from the date of the exchange of the ratifications of this treaty, any ships, wheresoever built, being *bonâ fide* the property of, and wholly owned by one or more citizens of Mexico, and whereof the master and three-fourths of the mariners, at least, are also natural born citizens of Mexico, or persons domiciliated in Mexico, by act of the government, as lawful subjects of Mexico, to be certified according to the laws of that country, shall be considered as Mexican ships; his Majesty the King of the United Kingdom of Great Britain and Ireland reserving to himself the right, at the end of the said term of ten years, to claim the principle of reciprocal restriction stipulated for in the Article VII. above referred to, if the interests of British navigation shall be found to be prejudiced by the present exception to that reciprocity, in favour of Mexican shipping.

ARTICLE II.—It is further agreed that, for the like term of ten years, the stipulations contained

in Articles V. and VI. of the present treaty, shall be suspended; and, in lieu thereof, it is hereby agreed that, until the expiration of the said term of ten years, British ships entering into the ports of Mexico from the United Kingdom of Great Britain and Ireland, or any of his Britannic Majesty's dominions, and all articles the growth, produce, or manufacture of the United Kingdom, or of any of the said dominions, imported in such ships, shall pay no other or higher duties than are or may hereafter be payable, in the said ports, by the ships, and the like goods, the growth, produce, or manufacture of the most favoured nation: and, reciprocally, it is agreed that Mexican ships entering into the ports of the United Kingdom of Great Britain and Ireland, or any other of his Britannic Majesty's dominions, from any port of the states of Mexico, and all articles the growth, produce, or manufacture of the said states, imported in such ships, shall pay no other or higher duties than are or may hereafter be payable, in the said ports, by the ships and the like goods, the growth, produce, or manufacture of the most favoured nation; and that no higher duties shall be paid, or bounties or drawbacks allowed, on the exportation of any article the growth, produce, or manufacture of the dominions of either country, in the ships of the other, than upon the exportation of the like articles in the ships of any other foreign country.

It being understood that, at the end of the said term of ten years, the stipulations of the said Vth and VIth Articles shall, from thenceforward, be in full force between the two countries.

The present additional articles shall have the same force and validity as if they were inserted, word for word, in the treaty signed this day. They shall be ratified, and the ratifications shall be exchanged at the same time.

Treaty of Amity, Commerce, and Navigation, between His Majesty and the United Provinces of Rio de la Plata. Signed at Buenos Ayres, February 2, 1825.

ARTICLE I. There shall be perpetual amity between the dominions and subjects of his Majesty the King of the United Kingdom of Great Britain and Ireland, and the United Provinces of Rio de la Plata and their inhabitants.

ARTICLE II. There shall be, between all the territories of his Britannic Majesty in Europe, and the territories of the United Provinces of Rio de la Plata, a reciprocal freedom of commerce. The inhabitants of the two countries, respectively, shall have liberty freely and securely to come, with their ships and cargoes, to all such places, ports, and rivers, in the territories aforesaid, to which other foreigners are or may be permitted to come, to enter into the same, and to remain and reside in any part of the said territories respectively; also to hire and occupy houses and warehouses for the purposes of their commerce; and, generally, the merchants and traders of each nation, respectively, shall enjoy the most complete protection and security for their commerce, subject always to the laws and statutes of the two countries respectively.

ARTICLE III. Same as third article in Mexican treaty.

ARTICLE V. No higher or other duties or charges on account of tonnage, light, or harbour dues, pilotage, salvage in case of damage or shipwreck, or any other local charges, shall be imposed, in any of the ports of the said United Provinces, on British vessels of the burthen of above 120 tons, than those payable in the same ports by vessels of the said United Provinces of the same burthen; nor in the ports of any of his Britannic Majesty's territories, on the vessels of the United Provinces of above 120 tons, than shall be payable in the same ports on British vessels of the same burthen.

ARTICLE VI. Same as in Mexican treaty.

ARTICLE VII. In order to avoid any misunderstanding with respect to the regulations which may respectively constitute a British vessel or a vessel of the said United Provinces, it is hereby agreed that all vessels built in the dominions of his Britannic Majesty, and owned, navigated, and registered according to the laws of Great Britain, shall be considered as British vessels; and that all vessels built in the territories of the said United Provinces, properly registered and owned by the citizens thereof, or any of them, and whereof the master and three-fourths of the mariners, at least, are citizens of the said United Provinces, shall be considered as vessels of the said United Provinces.

ARTICLE VIII.—All merchants, commanders of ships, and others the subjects of his Britannic Majesty, shall have the same liberty in all the territories of the said United Provinces as the natives thereof, to manage their own affairs themselves, or to commit them to the management of whomsoever they please as broker, factor, agent, or interpreter; nor shall they be obliged to employ any other persons for those purposes, nor to pay them any salary or remuneration unless they shall choose to employ them; and absolute freedom shall be allowed, in all cases, to the buyer and seller to bargain and fix the price of any goods, wares, or merchandise imported into, or exported from, the said United Provinces, as they shall see good.

ARTICLE IX.—In whatever relates to the lading and unlading of ships, the safety of merchandise, goods, and effects, the disposal of property of every sort and denomination, by sale, donation, or exchange, or in any other manner whatsoever, as also the administration of justice, the subjects and citizens of the two contracting parties shall enjoy, in their respective dominions, the same

privileges, liberties, and rights as the most favoured nation, and shall not be charged, in any of these respects, with any higher duties or imposts than those which are paid, or may be paid by the native subjects or citizens of the power in whose dominions they may be resident. They shall be exempted from all compulsory military service whatsoever, whether by sea or land, and from all forced loans or military exactions or requisitions; neither shall they be compelled to pay any ordinary taxes under any pretext whatsoever, greater than those that are paid by native subjects or citizens.

ARTICLE X.—It shall be free for each of the two contracting parties to appoint consuls for the protection of trade, to reside in the dominions and territories of the other party; but before any consul shall act as such he shall, in the usual form, be approved and admitted by the government to which he is sent; and either of the contracting parties may except from the residence of consuls such particular places as either of them may judge fit to be so excepted.

ARTICLE XI.—For the better security of commerce between the subjects of his Britannic Majesty and the inhabitants of the United Provinces of Rio de la Plata, it is agreed that if at any time any interruption of friendly commercial intercourse, or any rupture should unfortunately take place between the two contracting parties, the subjects or citizens of either of the two contracting parties residing within the dominions of the other shall have the privilege of remaining and continuing their trade therein, without any manner of interruption, so long as they behave peaceably and commit no offence against the laws; and their effects and property, whether intrusted to individuals or to the state, shall not be liable to seizure or sequestration, or to any other demands than those which may be made upon the like effects or property belonging to the native inhabitants of the state in which such subjects or citizens may reside.

ARTICLE XII.—The subjects of his Britannic Majesty residing in the United Provinces of Rio de la Plata shall not be disturbed, persecuted, or annoyed on account of their religion, but they shall have perfect liberty of conscience therein, and to celebrate divine service either within their own private houses or in their own particular churches or chapels, which they shall be at liberty to build and maintain in convenient places, approved of by the government of the said United Provinces: liberty shall also be granted to bury the subjects of his Britannic Majesty who may die in the territories of the said United Provinces in their own burial places, which, in the same manner, they may freely establish and maintain. In the like manner, the citizens of the said United Provinces shall enjoy, within all the dominions of his Britannic Majesty, a perfect and unrestrained liberty of conscience, and of exercising their religion publicly or privately, within their own dwelling-houses or in the chapels and places of worship appointed for that purpose, agreeably to the system of toleration established in the dominions of his said majesty.

ARTICLE XIII.—Same as ninth article in Mexican treaty,

ARTICLE XIV.—His Britannic Majesty being extremely desirous of totally abolishing the slave trade, the United Provinces of Rio de la Plata engage to co-operate with his Britannic Majesty for the completion of so beneficent a work, and to prohibit all persons inhabiting within the said United Provinces, or subject to their jurisdiction, in the most effectual manner and by the most solemn laws from taking any share in such trade.

*Treaty of Amity, Commerce, and Navigation, between Great Britain and Colombia.
Signed at Bogota, 18th April, 1825.*

ARTICLE I.—There shall be perpetual, firm, and sincere amity between the dominions and subjects of his Majesty the King of the United Kingdom of Great Britain and Ireland, his heirs and successors, and the state and people of Colombia.

ARTICLE II.—There shall be between all the territories of his Britannic Majesty in Europe and the territories of Colombia a reciprocal freedom of commerce. The subjects and citizens of the two countries, respectively, shall have liberty freely and securely to come, with their ships and cargoes, to all such places, ports, and rivers, in the territories aforesaid, to which other foreigners are or may be permitted to come, to enter into the same, and to remain and reside in any part of the said territories respectively; also to hire and occupy houses and warehouses for the purposes of their commerce; and, generally, the merchants and traders of each nation respectively shall enjoy the most complete protection and security for their commerce, subject always to the laws and statutes of the two countries respectively.

ARTICLES III. IV. V. and VI.—Same as in Mexican treaty.

ARTICLE VII.—In order to avoid any misunderstanding with respect to the regulations which may respectively constitute a British or a Colombian vessel, it is hereby agreed that all vessels built in the dominions of his Britannic Majesty and owned by British subjects, or by any of them, and whereof the master and three-fourths of the mariners, at least, are British subjects, excepting where the laws provide for any extreme case, shall be considered as British vessels; and that all vessels built in the territories of Colombia, and owned by the citizens thereof, or any of them, and whereof the master and three-fourths of the mariners, at least, are Colombian citizens, excepting where the laws provide for any extreme cases, shall be considered as Colombian vessels.

ARTICLES VIII., IX., X., XI., and XII.—Same as in treaty with Buenos Ayres.

ARTICLE XIII.—The government of Colombia engages to co-operate with his Britannic Majesty for the total abolition of the slave trade, and to prohibit all persons inhabiting within the territories of Colombia, in the most effectual manner, from taking any share in such trade.

ARTICLE XIV.—And forasmuch as it would be convenient and useful for the purpose of facilitating the mutual good understanding between the two contracting parties, and for avoiding all difficulties henceforward, that other articles should be proposed and added to the present treaty, which articles, both from a want of due time for their consideration, as well as from the pressure of circumstances, cannot at present be drawn up with required perfection, it has been and is agreed, on the part of both powers, that they will, with the least possible delay, come forward to treat and agree upon such articles as may be wanting to this treaty and deemed mutually beneficial, and which articles, when they shall be agreed upon and shall be duly ratified, shall form part of the present treaty of amity, commerce, and navigation.

Additional Article.

Whereas in the present state of the Colombian shipping, it would not be possible for Colombia to take advantage of the reciprocity established by Articles V., VI., and VII. of the treaty signed this day, if that part should be carried into immediate effect which stipulates that in order to be considered a Colombian ship a ship shall actually have been built in Colombia—it is agreed that for the space of seven years, to be reckoned from the date of the ratification of this treaty, any ships, wheresoever built, being *bonâ fide* the property of any of the citizens of Colombia, and whereof the master and three-fourths of the mariners, at least, are also Colombian citizens excepting where the laws provide for any extreme cases, shall be considered as Colombian ships;—his Majesty the King of the United Kingdom of Great Britain and Ireland reserving to himself the right, at the end of the said term of seven years, to claim the principle of reciprocal restriction stipulated for in article VII. above referred to, if the interests of British navigation shall be found to be prejudiced by the present exception to that reciprocity, in favour of Colombian shipping.

The present additional article shall have the same force and validity as if it were inserted, word for word, in the treaty signed this day. It shall be ratified, and the ratification shall be exchanged at the same time.

In witness whereof, the respective plenipotentiaries have signed the same, and have affixed thereto the seals of their arms.

Convention between His Majesty and the State of Venezuela. Signed at London, 29th October, 1834.

Whereas a treaty of amity, commerce, and navigation, consisting of fifteen articles, was concluded between his Majesty the King of the United Kingdom of Great Britain and Ireland and the state of Colombia, which said treaty, together with an additional article thereto, was signed at Bogotá, on the 18th day of April, 1825; and whereas, after reciting that extensive commercial intercourse having been established for a series of years between the dominions of his Britannic Majesty in Europe and the several provinces and countries of America which (then united) constituted the state of Colombia, it seemed good for the security as well as encouragement of such commercial intercourse, and for the maintenance of good understanding between his said Britannic Majesty and the said state, that the relations then subsisting between them should be regularly acknowledged and confirmed by the signature of a treaty of amity, commerce, and navigation; it was in and by the said treaty declared and agreed that, under certain regulations and conditions therein specified, there should be reciprocal freedom of commerce between the territories of his Britannic Majesty in Europe and the territories of Colombia: and whereas at the signing of the said treaty, the provinces of Venezuela were united with, and formed a component part of, the state of Colombia, but have since that time finally and entirely separated themselves therefrom, and from all other countries or provinces then or now united therewith, and have become a separate and independent state under a distinct government: and whereas it is desirable that the commercial relations or intercourse now or lately subsisting between the territories of his Britannic Majesty in Europe and the territories of the state of Venezuela respectively, should continue and be carried on in the same manner, and under the same regulations and conditions as are expressed and specified in the aforesaid treaty between his said majesty and the state of Colombia, and that his majesty should acknowledge the independence of the said state of Venezuela; it has been accordingly agreed to conclude a convention for the purposes aforesaid.

ARTICLE I.—His Majesty the King of the United Kingdom of Great Britain and Ireland and the state of Venezuela, the independence of which state is hereby acknowledged, recognised, and declared by his said majesty, mutually agree to adopt and confirm, as effectually as if the same were inserted word for word therein, the several articles and provisions of the aforesaid treaty con-

cluded between his said Majesty and the state of Colombia, together with the aforesaid additional article thereto; and that all the matters and things contained in such treaty and additional article shall, *mutatis mutandis*, from and after the conclusion of the present convention, be applied to the high contracting parties, their subjects and citizens, as effectually as if they were recited word for word herein; confirming and approving hereby all matters and things done or to be done by their respective subjects and citizens, under the aforesaid treaty, and in execution thereof.

ARTICLE II.—The high contracting parties further mutually agree to adopt and confirm, as part of the present convention, as effectually as if the same were inserted word for word herein, the declaration explanatory of that part of the VIIth article of the aforesaid treaty concluded between his Britannic Majesty and the state of Colombia, wherein it was defined what ships should be considered as entitled to the privileges of British and Colombian ships, which declaration was signed at London on the 7th day of November, 1825, by the Right Honourable George Canning, then his Britannic Majesty's Principal Secretary of State for Foreign Affairs, on behalf of his said majesty, and by Señor Manuel José Hurtado, plenipotentiary of the state of Colombia, on behalf of the said state; and that the said declaration, and the several provisions therein contained shall, from and after the ratification of the present convention, *mutatis mutandis*, be applied to his said majesty and his subjects, and to the said state of Venezuela and its citizens, as effectually as if the same were inserted word for word herein.

PERU.

Treaty of Amity, Commerce, and Navigation, between his Britannic Majesty and the Peru-Bolivian Confederation. Signed at Lima, June 5, 1837.

ARTICLE I.—Extensive commercial intercourse having been established for some time between the dominions of his Britannic Majesty and the States which compose the Peru-Bolivian Confederation, it seems good for the security as well as the encouragement of such commercial intercourse, and for the maintenance of good understanding between his Britannic Majesty and the said Confederation, that the relations now subsisting between them should be regularly acknowledged and confirmed by the signature of a treaty of amity, commerce, and navigation.

ARTICLES II., III., IV., V., VI., VII., VIII.—Same as in Mexican treaty.

ARTICLE IX.—In whatever relates to the police of the ports, the lading and unlading of ships, the safety of merchandise, goods, and effects, the succession to personal estates by will or otherwise, and the disposal of personal property of every sort and denomination, by sale, donation, exchange, or testament, or in any other manner whatsoever, as also the administration of justice, the subjects and citizens of the two contracting parties shall enjoy, in their respective dominions and territories, the same privileges, liberties, and rights as native subjects; and shall not be charged, in any of these respects, with any higher imposts or duties than those which are paid, or may be paid, by the native subjects or citizens of the power in whose dominions or territories they may be resident; subject of course to the local laws and regulations of such dominions or territories.

In the event of any subject or citizen of either of the two contracting parties dying without will or testament, in the dominions or territories of the said contracting parties, the consul-general or consul of the said nation, or, in his absence, his representative, shall have the right to nominate curators, to take charge of the property of the deceased, so far as the laws of each country will permit, for the benefit of his lawful heirs and creditors, without interference, giving convenient notice thereof to the authorities of the countries.

ARTICLE X.—The subjects of his Britannic Majesty residing in the Peru-Bolivian Confederation, and the natives and citizens of the Peru-Bolivian Confederation residing in the dominions of his Britannic Majesty, shall be exempted from all compulsory military service whatsoever, whether by sea or land, and from all forced loans, or military exactions or requisitions; neither shall they be compelled under any pretext whatsoever, to pay any other ordinary charges, requisitions, or taxes greater than those that are paid by native subjects or citizens of the territories of the contracting parties, respectively.

ARTICLES XI. and XII.—Same as in Mexican treaty.

ARTICLE XIII.—The subjects of his Britannic Majesty, and the citizens of the Peru-Bolivian Confederation, respectively, shall enjoy in their houses, persons, and properties, the protection of the government, and continue in possession of the privileges which they now enjoy. And the subjects of his Britannic Majesty residing in the territories of the Peru-Bolivian Confederation, shall furthermore enjoy the most perfect and entire security of conscience, without being annoyed, prevented, or disturbed on account of their religious belief. Neither shall they be annoyed, mo-

lest, or disturbed in the proper exercise of their religion, provided that this take place in private houses, and with a decorum due to divine worship, with due respect to the laws, usages, and customs of the country. In the like manner, the citizens of the Peru-Bolivian Confederation shall enjoy, within all the dominions of his Britannic Majesty, a perfect and unrestrained liberty of conscience, and of exercising their religion publicly or privately, within their own dwelling-houses, or in the chapels and places of worship appointed for that purpose, agreeably to the system of toleration established to the dominions of his said Majesty. Liberty shall also be granted to bury the subjects or citizens of either of the two contracting parties, who may die in the dominions or territories of the other, in burial places of their own, which, in the same manner, they may freely establish and maintain; nor shall the funerals or sepulchres of the dead be disturbed in any way, or upon any account.

ARTICLES XIV., XV., XVI.—Same as in Mexican treaty.

Additional Articles.

ARTICLE I.—Whereas, in the present state of Peru-Bolivian shipping, it would not be possible for the said Confederation to receive the full advantage of the reciprocity established by the Articles V., VI., and VII., of the treaty signed this day, if that part of the VIIth Article which stipulates that, in order to be considered as a Peru-Bolivian ship, a ship shall actually have been built in the Peru-Bolivian Confederation, should be strictly and literally observed, and immediately brought into operation; it is agreed that, for the space of fifteen years, to be reckoned from the date of the exchange of the ratifications of this treaty, any ships, wheresoever built being *bonâ fide* the property of, and wholly owned by, one or more citizens of the Peru-Bolivian Confederation, and whereof the master and three-fourths of the mariners at least are also natural born citizens of the Peru-Bolivian Confederation, or persons domiciliated in the Peru-Bolivian Confederation by act of the government, as lawful subjects of the Peru-Bolivian Confederation, to be certified according to the laws of that country, shall be considered as Peru-Bolivian ships; his Majesty the King of the United Kingdom of Great Britain and Ireland reserving to himself the right, at the end of the said term of fifteen years, to claim the principle of reciprocal restriction stipulated for in the Article VII. above referred to, if the interests of British navigation shall be found to be prejudiced by the present exception to that reciprocity, in favour of Peru-Bolivian shipping.

ARTICLE II.—It is further agreed that, for the like term of fifteen years, the stipulations contained in the Articles V. and VI. of the present treaty shall be suspended; and, in lieu thereof, it is hereby agreed, that until the expiration of the said term of fifteen years, British ships entering into the ports of the Peru-Bolivian Confederation, from the United Kingdom of Great Britain and Ireland, or any other of his Britannic Majesty's dominions, and all articles the growth, produce, or manufacture of the United Kingdom, or of any of the said dominions, imported in such ships, shall pay no other or higher duties than are or may hereafter be payable in the said ports by the ships, and the like goods, the growth, produce, or manufacture of the most favoured nation; and, reciprocally, it is agreed that Peru-Bolivian ships entering into the ports of the United Kingdom of Great Britain and Ireland, or any other of his Britannic Majesty's dominions, from any port of the Peru-Bolivian Confederation, and all articles, the growth, produce, or manufacture of the said Confederation, imported in such ships, shall pay no other or higher duties than are or may hereafter be payable in the said ports, by the ships and the like goods, the growth, produce, or manufacture of the most favoured nation; and that no higher duties shall be paid, or bounties or drawbacks allowed, on the exportation of any article, the growth, produce, or manufacture of the dominions of either country, in the ships of the other, than upon the exportation of the like articles in the ships of any other foreign country.

It being understood that, at the end of the said term of fifteen years, the stipulations of the said Vth and VIth Articles shall, from thenceforward, be in full force between the two countries.

The present additional articles shall have the same force and validity as if they were inserted, word for word, in the Treaty signed this day. They shall be ratified, and the ratifications shall be exchanged at the same time.

Treaty of Amity, Commerce, and Navigation, between his Majesty and the Republic of Bolivia. Signed at Sucre, September 29, 1840.

ARTICLES I., II., III., IV., V., VI., VII., VIII., IX., X.—Same as in Mexican and Peru-Bolivian Treaty.

ARTICLES XI. and XII.—Same as in Mexican Treaty.

ARTICLES XIII. and XIV.—Same as in Peru-Bolivian Treaty.

ARTICLES XV. and XVI.—Same as in Mexican Treaty.

Additional Articles.

ARTICLE I.—Whereas, in the present state of Bolivian shipping, it would not be possible for the said republic to receive the full advantage of the reciprocity established by the Articles V., VI., and VII. of the Treaty signed this day, if that part of the VIIth Article, which stipulates that, in order to be considered as a Bolivian ship, a ship shall actually have been built in the republic of Bolivia, should be strictly and literally observed, and immediately brought into operation; it is agreed that, for the space of fifteen years, to be reckoned from the date of the exchange of the ratifications of this Treaty, any ships, wheresoever built, being *bonâ fide* the property of, and wholly owned by, one or more citizens of the republic of Bolivia, and whereof the master and three-fourths of the mariners, at least, are also natural born citizens of the republic of Bolivia, or persons domiciliated in the republic of Bolivia by act of the government, as lawful subjects of the republic of Bolivia, to be certified according to the laws of that country, shall be considered as Bolivian ships; her Majesty the Queen of the United Kingdom of Great Britain and Ireland reserving to herself the right, at the end of the said term of fifteen years, to claim the principle of reciprocal restriction stipulated for in the Article VII. above referred to, if the interests of British navigation shall be found to be prejudiced by the present exception to that reciprocity, in favour of Bolivian shipping.

ARTICLE II.—It is further agreed that, for the like term of fifteen years, the stipulations contained in the Articles V. and VI. of the present Treaty shall be suspended; and, in lieu thereof, it is hereby agreed, that until the expiration of the said term of fifteen years, British ships entering into the ports of the republic of Bolivia from the United Kingdom of Great Britain and Ireland, or any other of her Britannic Majesty's dominions, and all articles, the growth, produce, or manufacture of the United Kingdom, or of any of the said dominions, imported in such ships, shall pay no other or higher duties than are or may hereafter be payable, in the said ports by the ships, and the like goods, the growth, produce, or manufacture of the most favoured nation; and, reciprocally, it is agreed that Bolivian ships entering into the ports of the United Kingdom of Great Britain and Ireland, or any other of her Britannic Majesty's dominions, from any port of the republic of Bolivia, and all articles the growth, produce, or manufacture of the said republic, imported in such ships, shall pay no other or higher duties than are or may hereafter be payable in the said ports, by the ships and the like goods, the growth, produce, or manufacture of the most favoured nation; and that no higher duties shall be paid, or bounties and drawbacks allowed on the exportation of any article, the growth, produce, or manufacture of the dominions of either country, in the ships of the other, than upon the exportation of the like articles in the ships of any other foreign country.

It being understood that, at the end of the said term of fifteen years, the stipulations of the said Vth and VIth Articles shall, from thenceforward, be in full force between the two countries.

ARTICLE III.—If in the drawing up of this Treaty in the Spanish language, an involuntary error has been made in the translation, the English text is to be adhered to.

The present additional articles shall have the same force and validity as if they were inserted, word for word, in the Treaty signed this day. They shall be ratified, and the ratifications shall be exchanged at the same time.

Treaty of Amity, Commerce, and Navigation between her Majesty and the Oriental Republic of the Uruguay. Signed at London, August 26, 1842.

ARTICLES I. and II.—Same as in Mexican Treaty.

ARTICLE III.—There shall be reciprocal liberty of commerce and navigation between and amongst the subjects and citizens of the two high contracting parties; and the subjects and citizens of the two countries, respectively, shall not pay in the ports, harbours, roads, cities, towns, or places whatsoever in either country, any other or higher duties, taxes, or imposts, under whatsoever names designated or included, than those which are there paid by the subjects or citizens of the most favoured nation; and the subjects and citizens of each of the high contracting parties shall enjoy the same rights, privileges, liberties, favours, immunities, and exemptions, in matters of commerce and navigation, that are granted, or may hereafter be granted, in either country, to the subjects or citizens of the most favoured nation.

No duty of customs or other impost shall be charged upon any goods the produce of one country, upon importation by sea or by land from such country into the other, higher than the duty or impost charged upon goods of the same kind, the produce of, or imported from, any other country. And her Majesty the Queen of the United Kingdom of Great Britain and Ireland, and the Oriental Republic of the Uruguay, do hereby bind and engage themselves not to grant any favour, privilege, or immunity in matters of commerce and navigation, to the subjects or citizens of any other State, which shall not be also and at the same time extended to the subjects or citizens of the other high contracting party; gratuitously, if the concession in favour of that

other State shall have been gratuitous ; and on giving as nearly as possible the same compensation or equivalent, in case the concession shall have been conditional.

ARTICLE IV., V., VI.—Same as in Mexican Treaty.

ARTICLE VII.—The subjects of her Britannic Majesty shall have full liberty, in all the territories of the Oriental Republic of the Uruguay, to manage their own affairs themselves, or to commit them to the management of whomsoever they please, as broker, factor, agent, or interpreter ; and they shall not be obliged to employ any other persons in those capacities, than those employed by the citizens of the Oriental Republic of the Uruguay ; and they shall not be restrained in their choice of persons to act in such capacities, nor be obliged to pay them any other salary or remuneration than such as is paid in like cases by the citizens of the said republic ; and absolute freedom shall be allowed in all cases to the buyer and seller to bargain and fix the price of any goods, wares, or merchandise imported into and exported from the Oriental Republic of the Uruguay, as they shall see fit, provided they observe the laws and established customs of the country. The same privileges shall be enjoyed in the dominions of her Britannic Majesty by the citizens of the Oriental Republic of the Uruguay, under the same conditions.

The subjects and citizens of each of the contracting parties, respectively, shall, in the territories of the other, receive and enjoy full and perfect protection for their persons and property, and shall have free and open access to the courts of justice in the said countries, respectively, for the prosecution and defence of their just rights ; and they shall be at liberty to employ, in all causes, the advocates, attorneys, or agents of whatever description, whom they may think proper ; and they shall enjoy, in this respect, the same rights and privileges therein, as native citizens.

ARTICLE VIII.—In whatever relates to the police of ports, the lading and unlading of ships, the safety of merchandise, goods, and effects, the succession to personal estates by will or otherwise, and the disposal of personal property, of every sort and denomination, by sale, donation, exchange, or in any other manner whatsoever ; and to the administration of justice ; the subjects and citizens of each of the two contracting parties shall enjoy, in the dominions and territories of the other, the same privileges, liberties, and rights, as native subjects or citizens ; and they shall not be charged, in any of these respects, with any higher imposts or duties than those which are or may be paid by natives ; conforming of course to the local laws and regulations of such dominions or territories.

And it is further agreed, that the subjects and citizens of the two contracting parties shall have and enjoy, in all the dominions or territories of each other, the most full and perfect liberty to devise or dispose of their property and effects of every kind and denomination, and wheresoever situate, by will or testament, to such person or persons, and in such proportions as their own free will may dictate.

If any subject or citizen of either of the two contracting parties should die without will or testament in the dominions or territories of the other, the consul-general or consul, or, in his absence, the representative of such consul-general or consul, shall have the right to nominate curators to take charge of the property of the deceased, so far as the laws of the country will permit, for the benefit of the lawful heirs and creditors of the deceased, without being interfered with by the authorities of the country, but giving to those authorities due and proper notice.

ARTICLE IX.—The subjects of her Britannic Majesty residing in the territories of the Oriental Republic of the Uruguay, and the citizens of the said Republic residing in the dominions of her Britannic Majesty, shall be exempted from all compulsory military service whatsoever, either by sea or land, and from all forced loans or military exactions or requisitions.

Neither shall they be compelled, under any pretext whatsoever, to pay any charges, requisitions, or taxes, greater than those which are or may be paid by native subjects or citizens of the territories in which they reside.

ARTICLE X.—It shall be free for each of the two contracting parties to appoint consuls for the protection of trade, to reside in the dominions and territories of the other party ; but no consul shall act as such, until he shall, in the usual form, be approved and admitted by the government to which he is sent ; and either of the contracting parties may except from the residence of consuls such particular places as they may judge fit to be excepted. The diplomatic agents and consuls of the Oriental Republic of the Uruguay, in the dominions of her Britannic Majesty, shall enjoy whatever privileges, exemptions, and immunities, are or may there be granted to agents of the same rank belonging to the most favoured nation ; and in like manner, the diplomatic agents and consuls of her Britannic Majesty in the territories of the Oriental Republic of the Uruguay, shall enjoy, according to the strictest reciprocity, whatever privileges, exemptions, and immunities, are or may there be granted to the diplomatic agents and consuls of the most favoured nation.

ARTICLE XI.—Same as Article XII. in Mexican Treaty.

ARTICLE XII.—Same as Article XIII. in Peru-Bolivian Treaty.

ARTICLE XIII.—The present Treaty shall be in force for the term of ten years from the date thereof ; and further, until the end of twelve months after either of the high contracting parties

shall have given notice to the other of its intention to terminate the same : each of the high contracting parties reserving to itself the right of giving such notice to the other at the end of the said term of ten years, or at any subsequent time.

And it is hereby agreed between them, that at the expiration of twelve months after such notice shall have been received by either party from the other, this Treaty, and all the provisions thereof, shall altogether cease and determine.

ADDITIONAL ARTICLE.—Whereas by Article IX. of the Treaty of Amity, Commerce, and Navigation, concluded and signed this day between her Britannic Majesty and the Oriental Republic of the Uruguay, it is stipulated that the subjects of her Britannic Majesty, residing in the said Republic, shall not be compelled, under any pretext whatsoever, to pay any charges, requisitions, or taxes, greater than those which are or may be paid by native citizens ; and whereas, by a law of the Oriental Republic of the Uruguay, a foreigner pays for the licence to open a shop, or other establishment included in the provisions of the said law, a sum greater than that which is paid by a native citizen ; her Britannic Majesty engages, notwithstanding the provisions of the above-mentioned Article, not to insist upon the abolition of this distinction, so long as it exists impartially with regard to the subjects or citizens of every other foreign nation.

And his Excellency the President of the Oriental Republic of the Uruguay engages, on his part, that if at any future time, the amount payable by British subjects for such licence should be increased, a corresponding increase shall at the same time be made in the sum payable by native citizens of the Republic ; so that the proportion between the sum payable by British subjects and the sum payable by citizens of the Oriental Republic of the Uruguay, respectively, shall never be altered to the prejudice of British subjects.

The present additional article shall have the same force and validity as if it were inserted, word for word, in the Treaty signed this day. It shall be ratified, and the ratifications shall be exchanged at the same time.

SECOND ADDITIONAL ARTICLE.—Whereas a strict and immediate execution of that part of Article VI. of the Treaty of Amity, Commerce, and Navigation, signed at London on the 26th of August, 1842, between her Majesty the Queen of the United Kingdom of Great Britain and Ireland, and the Oriental Republic of the Uruguay, which stipulates that a ship must have been actually built within the territory of the Oriental Republic of the Uruguay, to be considered a ship of that Republic, would, in the present state of Uruguay shipping, deprive the Republic of the full advantage of the reciprocity intended to be established by the Treaty ; it is agreed that, for the space of seven years from the date of the exchange of the ratifications of the said Treaty, any ships, wheresoever built, being owned, navigated, and registered in conformity with the provisions of Article VI. of the Treaty, shall be considered as ships of the Oriental Republic of the Uruguay : her Majesty the Queen of the United Kingdom of Great Britain and Ireland reserving to herself the right to claim, at the end of the said term of seven years, the strict enforcement of all the stipulations contained in the said article of the Treaty, relative to the conditions which are to determine the national character of vessels of the Oriental Republic of the Uruguay.

The present additional article shall have the same force and validity as if it had been inserted, word for word, in the aforesaid Treaty of the 26th of August, 1842. It shall be ratified, and the ratifications shall be exchanged at the same time and place as those of the Treaty.

BRAZIL.

The *Commercial Treaty* with Brazil has expired in accordance with a notice given two years previously to that effect. No new Treaty has as yet been negotiated in consequence of excluding, by a prohibitory duty, sugar, the produce of Brazil by the British sugar duties acts of 1842, 1843, 1844, 1845.

CHAPTER XXXIX.

CUSTOMS' TARIFF OF THE SPANISH AMERICAN REPUBLICS.

THE commercial regulations and custom-house prohibitions and duties of the Spanish American Republics have been characterised by barbarous restrictions and by ignorance of all sound principles of commerce and finance. The most absurd restrictions even upon internal traffic, and the most preposterous attempts to protect national industry, have been adopted since the independence of those states, and as suddenly and capriciously altered in form. These regulations, and prohibitions, and duties have, like the revolutions of those unfortunate countries, been suddenly and capriciously changed by every new ruler, but always to the great injury of trade and commerce.

Though the latest tables of duties which we have obtained may, in a very short period, be altered, we believe the changes will not, for some time, materially alter the amount of duty, nor the restrictions on trade.

MEXICO.

General Commercial Regulations for the Maritime and Frontier Custom-houses, according to the Laws of the 27th of August, 1845.

ARTICLE I.—Every vessel of whatever nation, not at war with Mexico, shall be admitted into such ports of the latter as are open to foreign commerce; and in the act of arriving, the captain, or supercargo, and the crew, as well as the vessel and the cargo, shall be subjected to the regulations prescribed in this decree; to the payment of duties, and to the penalties established by it, or to the measures in force at the time of arriving. Vessels shall therefore be considered as arrived for all the uses of this tariff immediately on casting anchor in the waters of the port.

ARTICLE II.—Vessels proceeding from a foreign port, not excepting national vessels, shall bring no more merchandise than is destined for the Mexican port to which they are bound. The breach of this article shall be punished by confiscating the vessel and the merchandise not destined to the same port.

ARTICLE III.—The following ports are open to foreign commerce:

	Sisal.
	Campeachy.
	Santa Juan Bautista de Tabasco.
	Vera Cruz.
In the Mexican Gulf	Santa Anna de Taumalipas.
	Matamoros.
	Matagorda.
	Velasco
	Galveston
In the Pacific	Acapulco.
	San Blas.
	Mazatlan.
In the Gulf of California	Guaimas.
In the Sea of Upper California	Monterey.

Section I.

ARTICLE IV.—National vessels, conveying foreign or native goods, produce, or other effects from one port to another, or others in the republic, shall be free from tonnage duties.

ARTICLE V.—The following effects shall be free of all duties in whatever vessel they may be imported, viz.:

1. Card-wire.
2. Exotic or dissected animals.
3. Quicksilver.
4. Mineral coal, until the mines of the republic supply it.

5. Mineralogical and geological collections.
6. Objects of natural history.
7. Designs and models of machines, edifices, monuments, and shipping.
8. Bricks and earth for foundry furnaces.
9. Printing types.
10. Printed books, stitched and manuscript, or printed music, not including in this exemption books and other prints used for infant schools, or for devotion, and bound or half-bound books.
11. Topographical and geographical maps and charts.
12. Machines, apparatus, and instruments for scientific purposes.
13. Machines and apparatus for agriculture, mining, and the arts, except *stills* that are not of new invention. (In this and the preceding classification *machines* are understood to be such works as are composed of various pieces, with the object of putting into play mechanical power; and *apparatus* such works as are composed of various pieces adapted for experiments in physics, and the chemical affinities of bodies, solid, liquid, gaseous, or imponderable; things that can be sold separately, such as pig iron, oil, broad cloth, plush, skins, &c., though coming as connected with machinery, shall be subject to the payment of duties.)
14. Ancient and modern coins of all metals, and facsimiles of them in compositions or pasteboard.
15. Ship masts.
16. Exotic plants and their seeds.
17. New vessels of all kinds, destined to become naturalised.
18. Linen rags.
19. Printing ink.

ARTICLE VII. Such articles as are declared free of importation duties, shall also be free of all other duties in their transit through the country.

ARTICLE VIII. Although the effects enumerated in the 5th article shall be free of all duties, they must be entered in the general manifest of the vessel, and bring particular invoices with them made in conformity with what is prescribed in Article XXVIII. Goods arriving in the republic without said documents, and having a consignee, he shall pay only a fine of fifty dollars, but should there be no consignee to take charge of them immediately, the fine shall be levied on said effects, which in this case shall be 100 dollars, and the surplus effects shall be delivered to the respective consuls, that they may hold them at the disposal of whoever may have a right to them.

Section II.—Prohibitions.

ARTICLE IX.—The importation of the following effects is prohibited under the penalty of confiscation, and other penalties imposed by this tariff:

1. Brandy distilled from sugar-cane, and any other not from the grape, except gin and rum imported in bottles and jars.
2. Starch.
3. Aniseed, cumin, and caraway-seed.
4. Capers.
5. Sugar of all kinds.
6. Rice.
7. Raw Cotton.
8. Indigo.
9. Brass and copper wire of all kinds.
10. Fire-arms, and other arms of all kind.
11. Sulphur.
12. Boots and half-boots of leather or cloth, with soles for men, women, and children.
13. Buttons of every metal, which are engraved or stamped on the obverse or reverse with the national or Spanish arms.
14. Coffee.
15. Manufactured wax.
16. Cast nails of all sizes.
17. Copper in pigs, and manufactured into utensils for domestic use.

18. Cumin.
19. Tortoiseshell and horn, manufactured into articles of the latter material only.
20. Epaulettes of all kinds and metals for military insignia.
21. Cordovan leather of all kinds and qualities.
22. Tin in blocks.
23. All kinds of prints, miniatures, pictures, and figures that are obscene, and in general every article of workmanship that is obscene, and contrary to religion and good morals.
24. Artificial flowers.
25. All kinds of galloons made of metals or other materials.
26. Chamois leather of all kinds.
27. Woollen cloths of the poorest and coarsest kinds, called "gerga" and "gergue-tilla."
28. Wheat flour, except for Yucatan.
29. Every kind, number, and colour of cotton yarn.
30. Every kind, number, and colour of cotton thread.
31. Thread of cotton and linen mixed.
32. Soap of all kinds.
33. Children's toys.
34. Common earthenware, glazed or not glazed, printed or plain.
35. Books, pamphlets, and manuscripts prohibited by competent authority.
36. Blank books, ruled or not ruled, and invoices, bills of exchange, bills of lading, and forms of custom-house documents, whether printed, engraved or lithographed.
37. Hog's lard.
38. Molasses.
39. Timber of all kinds, excepting for ship masts, fine wood for veneers, and that permitted in Tampico and Matamoros by the decree of the 3rd of June, 1840, subject to the duties assigned to it.
40. Munitions of war, whether of lead, or any other metal.
41. Playing cards of all kinds.
42. Gold leaf or tinsel.
43. Broad cloth, not of the first quality.
44. Parchments, except for drawing.
45. Lead in the rough or refined.
46. Gunpowder, except for sporting.
47. Ploughshares of the same form as that used in the country.
48. "Rebosos" (cotton scarfs of the country) of all kinds, and all printed or clouded cloths, imitating them.
49. All kinds of ready-made clothing, including vestments and clerical ornaments.
(The following articles excepted :
 Bands and sashes, with or without fringe.
 Covered buttons of all kinds. Leather shirts.
 Stocking web, shirts and drawers, whether of silk, cotton, or wool.
 Silk scarfs.
 Netted, or elastic caps, whether of silk, cotton, or wool.
 Gloves.
 Stockings, hats, and suspenders.
 Handkerchiefs.
 Shawls, with and without linings.)
50. Common salt.
51. Saltpetre.
52. Blankets and coverlets of cotton or woollen, or of a mixture of both.
53. "Sayal" (a fabric made of wool and hair) and sayalete (a coarse woollen stuff called in some places taminy).
54. Tallow in the rough and refined.
55. Tobacco of all kinds and in every form. It can only be imported by the director of the tobacco monopoly, but private licences for cigars and rappee will be granted

by the government, in which case the duties will be paid at three dollars per pound.

56. Plain and ribbed cloths, bleached, and unbleached, made of cotton alone or mixed, that do not exceed thirty threads weft and warp on a quarter inch.
57. Unbleached, twilled, and satin-faced cloths, made of cotton only or mixed, which do not exceed thirty threads weft and warp on a quarter inch.
58. Plain coloured cloths of fast colours made of cotton only, or mixed, which do not exceed twenty-five threads weft and warp on a quarter inch.

(When in this and other parts of the tariff colours are alluded to, it must be understood that the definition includes not only the colours which resist the action of water, soap, and light, but also those which do not resist them, but always retain enough colour to prevent them being used to the prejudice of the bleached and unbleached cottons manufactured in the country.)

59. Plain coloured cloths of fugitive colours, made of cotton only, or mixed, which do not exceed thirty threads under the quarter inch of weft and warp.
60. Salt pork cured or pressed and the offal of pigs.

(In this prohibition are not included *sausages* and *smoked hams*.)

61. Wheat and all other grain.
62. Shoes and slippers.

With respect to manufactured articles of iron and steel, the following are exempted from the said prohibition, and they shall pay the corresponding duties:—

- Awl blades.
- Fish hooks.
- Barrel hoop and hoop iron.
- Gimlets.
- Braces and bracebits.
- Gravers.
- Knives proper to the arts.
- Strings for musical instruments.
- Hand vices.
- Hooks for dentists.
- Files.
- Saws.
- Screws.

ARTICLE X. The law of the 29th of March, 1827, remains in force, inasmuch as the powers given by it to the states' legislatures for fixing the periods for allowing the importation, are exercised by the "juntas" of the departments.

ARTICLE XI. The importation of wheat into the state of Chiapas is permitted in such cases as the "junta" of the department shall determine.

Section III.—Of Duties on a Valuation to be fixed according to the prices of the Articles within the Republic.

ARTICLE XII. All goods, produce, and effects included in this tariff shall pay the rates designated in it.

The goods which exceed a vara in width shall be reduced to square measure, and the rate shall be collected on each square vara; but cloths under a vara wide, which are joined together by a seam or list, are not to be passed as a single piece, otherwise it will be held as a fraud. Those which are not specified in this tariff, shall pay an *ad valorem* duty of thirty per cent.

ARTICLE XIII.—The vessels, barrels, or bottles, which contain liquids, and the common wrappers of piece goods, including up to ten varas of inside wrapper, whether of linen, woollen, or cotton stuff not prohibited, will be exempt from duties, but if they exceed this length the whole shall pay duty according to this tariff, and should they be of a prohibited kind, they shall be confiscated.

SECTION IV.—Specific duties imposed according to fixed valuations on the basis of thirty per cent. These valuations are those which the goods are worth in Mexico, without any reference to the invoice prices. The following

Thread, cotton, or of cotton and wool, including the paper-packages.....	lb.	11 50	0 2 1				

Note 1.—All handkerchiefs which exceeds a square vara, shall be subject to pay duties, according to their kind, for the number of square varas they contain.

Note 2.—All the cloths included in this classification, although they may have a mixture of flax, hemp, grass, or tow, or any of them, shall pay the rate and duty as pure cotton, according to the description of cloth they are.

ARTICLE XVIII.—The weights and measures referred to in this tariff, and which shall regulate the collection of duties, are those of established usage in this Republic. The measures, therefore, are:—

The *vara*, of three feet long.

The *foot*, of twelve inches.

The *inch*, of twelve lines.

The weights are,—

The *quintal*, of four arrobas, is equal to 101 lbs. 7 ounces, averdupois.

The *arroba*, of twenty-five pounds.

The *pound*, of sixteen ounces, is equal to 1 lb. 4 drams nearly, averdupois.

The *ounce*, of sixteen drachms.

The *drachm*, of thirty-six grains.

The moneys named for the payment of duties are,—

The *dollar*, of eight silver rials, in value equal to about 4s. 2d. sterling.

The *cents*, one hundred to each dollar.

Dry Measure.—The cahiz contains 12 fanegas; and the fanega, 12 celemines. The latter has many sub-divisions. The fanega is of the capacity of 3439 cubic inches, English, and is equal to 1.599 bushel.

Liquid Measure.—The mozo of wine contains 16 arrobas, or cantaros; an arroba, 8 azumbras, or 32 quartillos. A botta contains 30 arrobas. The arroba measures 981 cubic inches, English, and is equal to 4.245 gallons. The arroba of oil is equal to 3.33 gallons.

Long Measure.—The foot is divided into 12 pulgadas, and is equal to 11.128 inches, English. The palmo measures 9 pulgadas, or $8\frac{1}{4}$ inches; the vara, 4 palmos, or 33.384 inches.

Section V.—Of the Formalities required to be observed previous to the departure of the Vessel from the Port of Shipment.

ARTICLE XXVII.—These formalities shall be observed :—

- 1st. By the shippers of goods to the Republic.
- 2nd. By the captains and supercargoes of the vessels which bring the said goods.
- 3rd. By the consuls, vice-consuls, or merchants, who certify the invoices of the shippers and the vessels' manifests in the mode expressed in the proper place.

Of the Shippers and Consignees of Goods.

ARTICLE XXVIII.—Any individual sending from a foreign country merchandise to the Mexican Republic, shall make one or more invoices (according as it suits him) of all the merchandise which he ships to each consignee. This invoice must contain the following particulars:—

- 1st. The name of the vessel and captain, and the port of Mexico to which the vessel is bound, together with the name of the party to whom the articles contained in said invoice are consigned.
- 2nd. The particulars in writing and cypher of the contents of all bales, cases, barrels, packs, or bundles in which each kind of merchandise comes.
- 3rd. The marks and numbers of each package.
- 4th. The name of the merchandise, and the particulars, in writing and cypher, of the quantity, weight, length, and breadth appertaining to the said merchandise, agreeably to what this tariff requires for the regulation of the payment of duties, it being understood that the width shall be expressed in the same kind of measure as the length.

The liquids and commodities, whose duties are regulated according to this tariff by weight, the invoices must specify in the kind of weight that is in use at the port from whence the vessel comes, and must give all particulars as to what it is.

5th. The signature of the owner or shipper.

6th. The shipper shall present to the Mexican consul, or vice-consul, residing at his port, three copies of the invoice, and this officer shall certify each one in the manner required in the thirty-fifth article, and then deliver to the said shipper one of the copies to be sent to his consignee by said vessel. Should there be no Mexican consul or vice-consul in the port, these invoices shall be presented to the consul or vice-consul of any other nation at peace with Mexico; but should there be no such consul or vice-consul there, then said invoices may be certified by two merchants of known reputation resident in the port. The form of the certificate will be, in all cases, that prescribed by the thirty-fifth article.

ARTICLE XXIX.—For the neglect of any one of these six requisites the collector shall impose the penalties hereinafter expressed, and exact them from the consignee.

- 1st. For the omission of each one of the requisites, 1, 2, and 3, a fine not under five, and not above twenty-five dollars.
- 2nd. Omitting to explain in writing and cypher what is required in 4, will incur a penalty similar to the one stated in the preceding paragraph; but if the invoice do not specify the quantity, weight, or measure of the goods, the whole of that part of the cargo not so specified shall be examined, and the duties on this part shall be charged twenty-five per cent more than that fixed in this tariff.
- 3rd. When the signature of the shipper is wanting in the invoices, the omission shall be punished by a fine of from five to twenty-five dollars; but should the signature be wanting in one or two copies, which in all other respects agree with the one signed, no penalty shall be incurred; and if they should not agree the aforesaid fine will be levied, and the duties shall be rated according to the invoice which will yield the greatest amount of them.
- 4th. In case the consular certificate, or that of two merchants where there are no

consuls, be wanting, the goods thus uncertified shall be placed in deposit for one month; during this time, should the consignee present certified invoices, the goods shall be despatched, without exacting any fine, but being longer in deposit without the required certificate being presented, they shall be confiscated. Where the certificate has been granted in any consulate, and the seal omitted, a fine shall be imposed of from ten to fifty dollars; but should this happen with respect to one or two of the copies, or that they be not certified at all, the penalty will be the same as that expressed in the preceding paragraph.

Great care is required in packing separately all articles liable to quick ignition by friction.

ARTICLE XXX.—All interpolations, corrections, scratchings, and erasures in the body of invoices are prohibited under a penalty of from fifty to two hundred dollars. Should any alteration be necessary, it shall be placed at the foot, and before the consular certificate, specifying clearly what is the alteration in the part or parts of said invoice, but without touching in any way the original writing, only in this way or in that expressed in Article XLI., can be admitted any alteration, otherwise the penalty imposed by this article shall be incurred.

ARTICLE XXXI.—Should the vessel have proceeded from two or more foreign ports, and have brought cargoes from each, she must bring invoices from each one of the goods taken on board at each place with the same number of copies and other requisites indicated in the preceding articles, and similar to those she brings from the first port of her sailing.

Of Captains of Vessels.

ARTICLE XXXII.—The duties of captains of vessels, spoken of in this tariff belong equally to supercargoes, when there are any.

ARTICLE XXXIII.—The captain of every vessel laden with any kind whatever of merchandise from a foreign port, must make a general manifest of them in triplicate, at the port of shipment, and this document shall specify:—

- 1st. The vessel's name and nation, the measurement of her tonnage in writing and cypher, the captain's name, the port of her departure, and the Mexican port to which she is bound.
- 2nd. The shippers' names and those of the consignees to whom the cargo is to be delivered.
- 3rd. The bales, cases, barrels, packs or packages of every kind, with their corresponding marks and numbers, the number of which shall be written in letters and cyphers, and each kind specified, whether they be bales or cases, &c.
- 4th. The general denomination of the merchandise shall be stated as it appears in the bills of lading.
- 5th. The date and signature of the captain.
- 6th. The captain shall present to the Mexican consul or vice-consul residing in the port from whence he sails, three copies of the manifest, in order that in each one may be written the certificate expressed in the thirty-fourth Article. Should there be no consuls or vice-consuls there, the provision stated in the sixth paragraph of the twentieth Article shall be observed.

ARTICLE XXXIV. For the omission of any of the first five conditions aforesaid, the captain shall be fined from five to twenty-five dollars, to be regulated by the collector.

ARTICLE XXXV.—In case the certificate alluded to in the sixth condition be omitted in the three copies of the manifest, the vessel, and all that belongs to it will be confiscated but the cargo will not be subject to this penalty provided its respective invoices and certificates are in order.

ARTICLE XXXVI.—The omission of the certificate, seal, or captain's signature, and any one of the three copies of the manifest shall be liable to similar fines as the omissions of a similar nature in the shipper's invoices.

ARTICLE XXXVII.—It will be the captain's duty to avoid the defects in his manifest spoken of in Article XXX., and in case there be any, to have them rectified in the same manner as is stated in the said article, under the penalty of 200 dollars for each infraction.

ARTICLE XXXVIII.—The captain is equally obliged to present certified manifests of any cargo he may receive at ports where he may stop at, after his first sailing, as well as to have invoices made out agreeably to Article XXX., under the penalty of losing his vessel, and all that belongs to her, for such omission.

Of Consuls and Consular Certificates.

ARTICLE XXXIX.—The consuls and vice-consuls of the republic resident in foreign countries, are required under the strictest penalty of the law punctually to observe all the provisions of this tariff that relate to themselves. At the same time, the republic expects all consuls, vice-consuls, and merchants of friendly nations, to proceed agreeably to these instructions, in the exercise of that protection which in their official capacity it is their duty to extend to the fair trader, and thus protect the captains of vessels and shippers of goods from the injuries to which they would be exposed by any deviation from the forms prescribed in this tariff for their guidance.

ARTICLE XL.—As soon as any captain or super-cargo of a vessel presents the consul with the manifest in triplicate, of the cargo destined to any Mexican port, or when any merchant delivers him his invoices in triplicate, he shall intimate to them that if any alteration is necessary, it must be done immediately without losing sight of the provision relative to alterations contained in Articles XXX. and XXXVII.; for when once the certificate is added, no alteration whatever shall be admitted.

ARTICLE XLI.—By virtue of what is provided in Article XXX., no consul, vice-consul, or merchant, shall certify any manifest or invoice brought to them with interpolations, corrections, scratchings, or erasures; in such case they shall be returned to the owner to be written out afresh; but if it should happen that the sailing of the vessel does not allow time for this, the consular certificate may be added, provided said defects are described in it, whether they occur in manifests or invoices; such defects being interpolations, corrections, scratchings, or erasures. The fees of office in such case, will be double what is commonly paid for a certificate. When any manifest or invoice has not passed these forms, the fine imposed by the Articles XXX. and XXXVII. will be incurred by the captain or consignee.

ARTICLE XLVIII.—Before certifying the manifests of the captains and the invoices of shippers, the consul or vice-consul shall ask if they are aware of the kind of goods, produce, and other merchandise prohibited from entering the republic, and of the penalties imposed by this tariff on those who trade in such merchandise. If they reply in the affirmative, their documents shall be certified; if the contrary, they shall be made aware of them before the certificates are granted.

Section VI.—Of the Arrival of Vessels at the Ports of the Republic.

ARTICLE XLIX.—All foreign vessels arriving at the ports of the republic, shall pay a tonnage duty of twelve rials per ton, and national vessels arriving direct from foreign ports shall be subject also to the same.

The anchorage dues in respect to both are abolished.

ARTICLE L.—When a vessel, after her total discharge, is permitted, agreeably to Article CV., to go from one port to another in the republic, in order to ship merchandise of the country, tonnage duties shall not again be exacted, but in order to enjoy this privilege, it must be understood that she comes direct from a national port, otherwise she shall pay the usual dues.

ARTICLE LI.—The captains or supercargoes of vessels proceeding from a foreign port, on arrival in the waters of a Mexican port, shall not allow any person whatever to come on board until they have been visited by the quarantine officers, and those of the custom-house, whose boats shall carry the national flag. The violation of these provisions shall subject the captain or supercargo to a fine of fifty dollars. An equal fine shall be exacted from any person not belonging to the vessel, who shall either speak or board her before the visit of the aforesaid officers.

The non-payment of the fine shall be remedied by confining the defaulters, who shall also suffer for breaking the quarantine regulations.

ARTICLE LII.—Whether the vessel be in the act of sailing or anchored, as soon

as a revenue officer, or some one authorised by the collector of the customs, should he think proper to appoint such, shall go on board; the captain or supercargo shall deliver in the same moment to either one or other of the aforesaid officers the packet or packets addressed to the collector agreeably to Article XXXVIII.; should he fail to do so without being able to produce justifiable proof of some extraordinary accident having occurred during the voyage, he shall be subjected to a fine of 200 dollars, besides the expenses of making new copies of the manifest taken from the third copy which he brings with him as required by the same Article XXXVIII., and from the invoices presented by the consignees, which copies shall be authorised by the collector and comptroller of the custom-house.

If the lost manifest be that which the captain should bring with him, and its absence be not accounted for from a similar cause, he shall be fined fifty dollars; but should the sealed packet inclosing the two copies of manifest of invoices, together with his own manifest be wanting, and their absence not be honestly accounted for, the vessel and all that belongs to her shall be confiscated, but not the cargo; if, however, the consignee of any part of it do not present his invoices as required by Article XXXVIII., then this part also shall be confiscated. As a general rule, the non-delivery of the three copies of the ship's manifest, or that of the invoices without a sufficient cause being shown before a revenue law-court, shall be punished with the confiscation of the vessel and that part of the cargo involved in it. Of all which, advice shall be given by the first post to the principal office of customs and direct taxes.

ARTICLE LIII.—At the same time that the captain or supercargo delivers the packet treated of in the foregoing article, to the revenue officer or the agent from the custom-house, he shall also deliver to them a note signed by him, stating the trunks, valises, and any other baggage belonging to his passengers, expressing the names of those to whom they belong. Said note shall also contain the stock on hand of provisions belonging to the vessel. The non-delivery of this note shall subject the captain to a fine of fifty dollars.

ARTICLE LIV.—Should the stock of provisions appear to the collector of the custom-house excessive in the extreme, he shall have power to order it to be deposited in the custom-house stores, directing the vessel to be supplied with what may be necessary for its consumption, and allowing the remainder to be embarked only when there be no risk of fraud.

ARTICLE LV.—The captain or supercargo having omitted to deliver a note stating the baggage and the surplus stock of provisions, it shall be supplied by the revenue or custom-house agents, forming one by taking the particulars as given by the passengers in respect to their luggage; and by taking an inventory of the stock of provisions at the same time if possible, either before or after the vessel has finished her discharge. The officer who does this, shall add his signature, and it shall be at the option of the collector to fix the time for doing it.

ARTICLE LVI.—Should the vessel have suffered stress of weather during her voyage, causing part of the cargo to be thrown overboard, or having been forced to put into port, and obliged to sell some part of the cargo to meet expenses, then the captain or supercargo shall present a declaration in writing of the circumstances, and deliver the same to the revenue officer, or to the agent of the custom-house, with the sealed packet containing the manifest and invoices.

ARTICLE LVII.—As soon as the collector receives this declaration, he shall communicate it to the mercantile tribunal, which shall immediately proceed to obtain proofs of the alleged facts. If the case be of goods thrown overboard, it will be necessary to prove it, not only by the affirmation of the passengers and crew, but also by the entry of it in the log-book. Similar evidence will be required of the sales made at the port which the vessel may have been forced to put into, and besides a certificate of the fact shall be legalised by a public authority at said port.

ARTICLE LVIII.—On the facts as stated having been proved, no duties shall be exacted on the merchandise thrown overboard or sold.

ARTICLE LIX.—The principal revenue officer or the custom-house officer having received the sealed packet, and the statement as required by Articles XLIV. and XLV., which

the captain or supercargo ought to deliver to one of the two, said officer shall give the captain or supercargo the proper receipt, which shall in every case be a printed form, bearing the custom-house seal. This being done, he shall immediately proceed to seal the hatches and other parts of the hold of the vessel. No guard shall remain on board, excepting when the collector so orders it, which order must be in writing.

ARTICLE LX.—Due vigilance shall be used by the revenue officers both by land and water, in order to prevent communication with the vessel, or fraudulent extraction of the cargo.

ARTICLE LXI.—The principal revenue officer, or the custom-house agent, on landing shall immediately deliver into the hands of the collector the sealed packet containing the manifest and invoices, as well as the list of luggage and stock of provisions, and without any delay the collector shall put into the post-office the packet for the Minister of Finance, in order that it may be forwarded by the first mail, or by an express, should there be one. After this the collector shall compare the documents, and finding them in order, shall sign them.

ARTICLE LXII.—Within twelve business hours from casting anchor, the captain or supercargo shall deliver to the collector and comptroller, or to the person who acts for them, the third copy of his general manifest, as required by Article XXXVIII. He shall make oath in the manner he holds most solemn and in due form before said officers, that all the merchandise on freight and for sale, forming the vessel's cargo, is contained in the manifest, and in the list of luggage and stock of provisions presented by him. Should he refuse to make oath, the collector shall direct the captain of the port to detain the vessel until the custom-house be satisfied that there is no fraud.

ARTICLE LXIII.—Within twelve business hours after the delivery of the correspondence, the consignees shall present their copies of invoices belonging to the cargo, making oath to each with their signatures affixed, that they are correct and in order according to the best of their knowledge and belief, taking into account the corrections which may have been made. Should the consignee refuse to make oath in the manner aforesaid, the merchandise included in his invoices shall be examined piece by piece, and with the greatest scrutiny.

ARTICLE LXIV. The consignee named in the invoice of the shipper of the goods may refuse to receive them, provided he renounce his right during the twelve business hours granted for presenting the invoices, and provided also he present them at the time of formally refusing the consignment.

ARTICLE LXV.—The time fixed in the preceding article having elapsed without either refusing to receive the goods or presenting the corresponding invoices, it shall be understood that the consignment is accepted.

ARTICLE LXVI.—Should there be several consignees in common, the refusal must be signed by all. But if they are named in order, 1, 2, 3, &c., the refusal of the last in order is equivalent to that of all those who precede.

ARTICLE LXVII.—If the shipper of the goods, whose consignment is refused, be a citizen of the republic, the collector shall inform the mercantile tribunal of it, and it shall name two respectable merchants as consignees.

ARTICLE LXVIII.—If one of these refuse, and the other consent, this one alone shall be the consignee. The refusal of these consignees officially named must be made within two business days after the date of their nomination, otherwise it shall be understood that they have accepted the consignment.

ARTICLE LXIX.—Should both the persons thus appointed refuse, the tribunal shall inform the collector, who shall order the goods to be sold at public auction to the best bidder. From the produce of the sale, the duties shall be deducted, and the balance placed in deposit with the mercantile tribunal on account of the owner.

ARTICLE LXX.—Should the shipper of the goods whose consignment has been refused be a foreigner, the collector shall make an official communication to the consul or vice-consul belonging to the same nation, advising him of it, in order that within the time limited by Article LX., he may state whether or not he will take charge of the goods; after this limited time expires, he shall be considered the consignee.

ARTICLE LXXI.—The consul or vice-consul having declined the charge, the goods shall be disposed of as directed in Articles LXVII., LXVIII., and LXIX.

ARTICLE LXXII.—Any vessel anchoring in a Mexican port, whose object is neither to receive or discharge cargo, but merely to repair damages, or take in provisions for the crew, shall be permitted to remain during the time necessary for this object, but on condition that all the papers belonging to the cargo be exhibited, and that she be subject to all the regulations and precautions established for all other vessels arriving at and destined for these ports. If any transshipment of goods take place without the permission given by the collector to store them during the time of careening, and it be discovered, the vessel shall be dealt with in the manner prescribed in Articles CXX., CXXI., and CXXII., according to the kind of the goods. When the damage is of such a kind as to prevent the vessel continuing her voyage, the collector shall inform the government, in order that it may determine what ought to be done.

ARTICLE LXXIII.—The captain or supercargo, during the twelve business hours allowed him for presenting his manifest, and the consignees, during the twelve hours allowed them for their invoices, may correct at the foot of them any of the defects fineable by Articles XXVIII., XXXIV., and XXXVI., of this tariff, but no defects can be reformed which incur the penalty of confiscation, nor that of 25 per cent augmentation in the duties, as spoken of in the 2nd part of Article XXVIII., nor in respect to the omissions treated of in Article LXXXIV, because these penalties falling on breaches of the law which cannot be attributed to forgetfulness, or involuntary negligence, do not merit indulgence; the aforesaid reforms shall free those who were liable to the corresponding fines.

Section IX.—Of Exportation.

ARTICLE CX.—Foreign vessels shall not be allowed to carry on the coasting-trade, or of "Echelle," in the ports of the republic, but after concluding their discharge in any of them, and having cleared, they may go directly to those open to the coasting or other trade, in order to load dyewood, or any other national produce that is exempted by law from duties of exportation, provided always that they have a certificate in due form from the respective custom-houses of having there paid the tonnage duties.

ARTICLE CXI.—In order to enjoy the privilege granted in the preceding article, all foreign vessels must submit to the visit of the officers of health and search belonging to the port at which they arrive; and should they carry money to make purchases, they must have also a certificate in due form from the respective custom-houses, expressing in figures and writing the amount embarked, and that the export duties appointed by this tariff have been paid.

ARTICLE CXII.—All goods, produce, and national commodities shall be free of all duties on exportation, neither shall they be liable to duties of any kind whatever in their transit through the interior of the country or coastwise, excepting the following, which they shall pay to the national revenue:—

Gold in coin	3 per cent.
Gold bullion (quintado)	6 "
Silver in coin	6 "
Wrought silver (quintado)	7 "
Virgin silver, accompanied with certificate of having paid "quinto" duty	7 "

ARTICLE CXIII.—The exportation of gold and silver in bars or ingots, in ore, and dust, Mexican monuments and antiquities, and the seed of the cochineal is prohibited under penalty of confiscation; but this prohibition shall not extend to small quantities of the mineral ores and dust intended for specimens as curiosities; but a permit from the government for their exportation will always be required.

ARTICLE CXIV.—The permission to export gold and silver bullion at the ports of Guainas and Mazatlan shall be continued, under the conditions and formalities prescribed in the decrees of the 10th November, 1841, and 16th February, 1842, gold when exported paying 11 per cent and silver $9\frac{1}{2}$ per cent on the value, besides 1 per cent more for each of duty imposed by the 2nd article of the decree of the 10th March of

this year, when not sent to the mint to be coined. The collection of these duties hereby authorised is exempt from the term of credit allowed by the 101st article.

ARTICLE CXV.—Articles subject to export duty, shipped clandestinely to evade the payment of duty shall be confiscated, if so discovered: should the goods be beyond seizure, a fine equal to the amount of them valued at the market price shall be levied. Should the article have been embarked and the vessel still in port, the respective tribunals shall cause it to be landed, or, in case of resistance, shall proceed against the captain or supercargo of the vessel, imposing penalties on them equal to the degree and circumstances of the offence.

ARTICLE CXVI.—The exportation of goods not liable to duty being effected, without attending to the formalities prescribed, shall be punished with a fine equal to 10 per cent of their value, taken at the market price of the goods.

Section X.—Of other Cases wherein fines or penalties shall be incurred.

ARTICLE CXVII.—Besides the cases specified already in the respective articles of this tariff for levying penalties, there are others which incur them, should the following provisions be infringed:—

ARTICLE CXVIII.—If any foreign vessel, of whatever burden or form, or wherever she may have come from, be found loading or unloading goods of any kind at any coast, river, harbour, bay, or other place not pointed out by this tariff as a port for foreign vessels, she shall for this alone be confiscated, together with the cargo and all that belongs to her. The commander of said vessel shall be fined from 500 to 3000 dollars, according to the value of the cargo, and shall be condemned besides to from six months to five years of labour and banishment. All those who knowingly aid or protect the loading of said vessels, or the carriage of goods by land introduced into or carried out of places described in this article, shall suffer the following fines and punishments, viz.;—the owner, or his deputy, of the carts, beasts of burden, and every thing used in the transport of the effects, and the persons who receive the goods, as well as he who delivers, deposits, takes charge of, or conceals them, shall all undergo the same penalties and punishments as the captain or supercargo of the vessel, and the other shall be punished by paying a tenth-part of the fine, and suffering a tenth of the punishment imposed on the principals.

National vessels shall be liable to the same penalties on coming from a foreign port and entering any of those not open to foreign commerce, if found shipping any effects whatever for a foreign country, and when they are found loading or unloading any kind of goods whatever at ports or places not open to foreign commerce, or to the coasting trade.

ARTICLE CXX.—All merchandise found in ports open to foreign commerce, or the coasting trade, which has been introduced, or be in the act of being introduced, without being subjected to the forms prescribed in this decree, and without observing any of the instructions or regulations issued by the government, shall be confiscated, together with all the boats, canoes, and vessels of every class.

ARTICLE CXXI.—Should said merchandise be prohibited, there shall be imposed besides the fines in Article XCVII.;—

ARTICLE CXXII.—Should they be goods of which the government has a monopoly, the importers and exporters who introduce them in another port or coast of the republic, together with him who delivers and receives them, shall suffer, besides the confiscation of the goods, vessels, cars, beasts for riding or of burden, with their harnesses, equipments, and arms, a fine of double the value of the monopolised goods, rated at the price of the monopoly at the respective places, and in default of payment shall be condemned to banishment for the term of from two to eight years.

ARTICLE CXXIII.—Should false money, whatever the metal may be, be found, besides the confiscation of every thing mentioned in the preceding article, and besides a fine equal to what the false money would represent if legal, the offender shall be punished with all the penalties inflicted by the law on coiners; should the offender be unable to pay the fine, the metal shall be melted, and held, together with all the property that may have been recovered, for the benefit of the informer, and those who seized it.

Passports.—The master of any vessel coming from a foreign port, shall immediately on his arrival in any of the ports of the Republic, declare in writing to the chief of the maritime custom-house, the number of passengers he has on board, the country to which they belong, their trade or occupation, and the place where they embarked. The penalty for neglect to comply with this regulation, or the making a false statement, is 100 dollars, and an additional fine of twenty dollars for each passenger omitted in the report. The vessel may be detained until the penalty be paid. Seamen, whose names are entered on the roll, are not considered as passengers.

Every foreigner shall, before he disembarks, declare his name, age, stature, place of birth, from whence he came, his destination, the object of his voyage, and his profession, which, when executed by the head of a family, will be sufficient for the women and children thereof.

The declaration above must be in writing, and signed by the person making the same.

This formality being complied with, the collector shall give to the foreigner a permit to disembark, subject, however, to the following rules:

1. That no Spaniard, or subject of the Spanish government, shall enter the Republic.

2. That any foreigner provided with a passport from the general government may disembark.

3. That the citizens of the new States of America, and the subjects of nations who may have agents officially accredited to the Republic, may also land, having passports granted, or examined by any Mexican agent at the place of embarkation, or on security of their consul in the port where they may arrive, or on that of any Mexican citizen.

The subjects of nations who are not comprehended in the foregoing paragraph, shall only be permitted to land with a passport of the General government, or with one granted or examined by any Mexican agent residing in a foreign country.

The foreigner to whom such permit is granted, must, within twenty-fours of having landed, present himself to the civil authority of the port.

Any foreigner permitted to introduce himself into the Republic as aforesaid, shall, within one month thereafter, solicit of the Supreme government, a *carta de seguridad* (card of safety), to remain in, and pass through the same for the period of one year; in order to obtain which, a certificate will be required from the officially accredited agent of the applicant, stating that he is a subject or citizen of the nation he represents, as also his occupation or profession.

Every foreigner, whatever his passport may be, must present himself to the civil authority of the place where he may have resided more than eight days; and, also, whenever he may change his place of residence; non-compliance with that provision subjects the party to a fine of twenty dollars.

Foreigners introduced and established agreeably to the regulations herein prescribed, shall be under the protection of the laws, and enjoy the same civil rights that are conceded by said laws to Mexican citizens, with the exception of acquiring real estates, which can only be held by citizens.*

Any foreigner who shall disembark and introduce himself into the territory of the republic contrary to the provisions of this decree, shall be expelled therefrom. As, also, any foreigner who shall be adjudged guilty of having used, for the purpose of his disembarkation, any document belonging to another, or for having suppressed or falsified any of the statements required, or for having counterfeited or altered any passport or *carta de seguridad*.

Every foreigner wishing to leave the republic, must make application for the proper passport, either to the General government or the civil authority of the state in which he may be.

* This exception does not extend to lands belonging to mining establishments in which aliens may hold shares. Aliens may purchase and hold land by permission of the general government for federal territory, or of the state governments for state territory. By the colonization law, aliens may also hold land, but one-fourth part of the colonists must be Mexicans.

TARIFF OF YUCATAN.

This state having declared its independence the following tariff regulations were adopted by the late Congress.

The ports open to foreign commerce, are Campeachy and Sisal. For exportation only, the ports of Laguna and Bacalar are designated.

The tonnage duty on foreign vessels, from foreign ports, is fixed at one dollar fifty cents per ton, according to her register. Vessels arriving in distress to be subject to charge, except that of their anchorage duty.

The officers, crew, and passengers of all vessels arriving in the port of Yucatan, are forbidden to land without a permit from the visiting health officer, under a penalty of 200 dollars.

The duties on importations, which shall not exceed 200 dollars, to be paid in cash; if exceeding that sum, to be paid by three instalments in the course of ninety days. The duties on exported articles to be paid on the clearance of the vessel.

Prohibited Articles.—The importation of the following articles is prohibited, under the penalty of confiscation, viz.: cotton, indigo, rice, sugar, trunks, hogs, chocolate, coverlids, sacks, obscene pictures, beans, copper pans, grain, meal, yarn, soap (except scented), lard, molasses and honey, combs, skins (except morocco leather, clothing), salt, tallow, and candles, saddles, straw hats, tobacco, beef, shoes.

Articles Duty Free.—Live animals for improving breeds, newly-invented carriages, wooden houses; instruments of agriculture, of science, or of the arts; types for printing; books in sheets or bound; hops, sugar machinery; specie; iron and steel, for machinery; maps, exotic plants, leeches, seeds, turning machinery.

Export Duty.—All articles are free of duty for exportation, except the following:—Gold, in bars, or coin, one per cent; silver, two per cent; logwood, eight per cent. Every captain and supercargo is permitted to export 100 dollars worth of articles, free of duty, on account of the expenses of the vessel.

General Import Duty.—Flour, forty per cent ad valorem; olive, linseed, and whale oil, twenty; steel, twenty-nine; brandy, forty; codfish, twenty; empty bottles, twenty; cotton goods, fifteen; iron chains, fifteen; beef and pork in barrels, twenty; Cashmere goods, twenty; wax, forty; beer and porter in bottles, fifty; nails, fifteen; sheet copper, fifty; glassware, twenty; knives and forks, twenty; linen goods, fifteen; drugs, forty; brandy fruits, twenty; sewing thread, twenty; hams, twenty; liquors, forty; listadees, twenty; apples, twenty; mustard, twenty; muslins, twenty; paper, twenty; perfumery, forty; cheese, twenty; cutlery, twenty; watches, six; clocks, twenty; vinegar, forty; wines, forty.

CHAPTER XL.

YUCATAN.

YUCATAN, though noticed under the head of Mexico as one of the states of that republic, may now be considered as entirely separated from those which had joined that, at all times, loosely-bound confederacy.

The state of Yucatan attained independence of Spain at the same time as Mexico. It had previously, under Spain, an administration unconnected either

with Mexico or Guatemala. The last account of Yucatan, upon which we can place any reliance, is found in Mr. Stephens's very interesting work; which, however, is chiefly devoted to illustrate the wonderful ruins which he has explored in this Peninsula and in Central America.

His descriptions of the soil and climate are brief, and confined to the localities which he visited. We deduce from the information which he gives, that Yucatan is a country remarkable for bad roads, or rather the general want of roads,—a soil, in which stony and not very fertile districts, prevail; rich vegetation where there is moisture, on those soils of which fertility is the character; a general want of water; few good harbours; a hot climate; occasional forests, with wild beasts and reptiles; pastures, with herds of cattle; ranchos and haciendas; towns and villages with cathedrals and churches; a population ignorant and superstitious, yet towards him kindly disposed; with industry in a very backward state; with little trade, and few, or only rude, manufactures. But that Yucatan, notwithstanding a hot, and in many parts an unhealthy climate, and other disadvantages, is still capable of being important as a productive country, and of maintaining a large population.*

In alluding to the political state of Yucatan, Mr. Stephen says—

“Separated from Spain, in an evil hour Yucatan sent commissioners to Mexico, to deliberate upon forming a government, and on the return of these commissioners, and on their report, she gave up her independent position, and entered into the Mexican confederation as one of the states of that republic. Ever since, she has been suffering from this unhappy connexion, and a short time before our former visit, a revolution broke out all over the country, in the successful progress of which, during that visit, the last Mexican garrison was driven out of Yucatan. The state assumed the right of sovereignty, asserting its independent powers, at the same time not disconnecting itself entirely from Mexico, but declaring itself still a component part of that republic, upon certain conditions. The declaration of its independence was still a moot question. The assembly had passed a bill to that effect, but the senate had not yet acted upon it, and its fate in that body was considered doubtful. In the mean time a commissioner had been sent to Texas, and two days after our arrival at Merida, the Texan schooner of war, *San Antonio*, arrived at Sisal, bringing a proposition for Yucatan to pay 8000 dollars per month, toward the support of the Texan navy, and for the Texan vessels to remain upon the coast of Yucatan and protect it against invasion by Mexico. This proposition was accepted immediately, and negotiations were pending for further co-operation, in procuring a recognition of their mutual independence.

* This corresponds nearly with the sketch of Yucatan which we have taken from Alcedo.—See pp. 322 and 323.

"Thus, while shrinking from an open declaration of independence, Yucatan was widening the breach, and committing an offence which Mexico could never forgive, by an alliance with a people whom that government, or rather Santa Anna, regarded as the worst of rebels, and whom he was bent upon exerting the whole power of the country in an effort to reconquer. Such was the disjointed and false position in which Yucatan stood at the time of our presentation to the governor, Don Santiago Mendez. He was about fifty years of age, tall and thin, with a fine intellectual face, and of very gentlemanly appearance and deportment.

"Our visit to him was made at his private residence, which was one befitting his station as a private gentleman, and not unworthy of his public character. His reception-room was in the *sala*, or parlour, of his house, in the centre of which, after the fashion of Merida, three or four large chairs, covered with morocco, were placed facing each other.

"Free from internal wars, and saved by her geographical position from the sanguinary conflicts common in the other Mexican states, Yucatan has had no school for soldiers; there are no military chieftains, and no prepossessions for military glory. Don Santiago Mendez was a merchant, until within a few years, at the head of a respectable commercial house in Campeachy. He was so respected for uprightness and integrity, that, in the unsettled state of affairs, he was agreed on, by the two opposite parties, as the best person in the state to place at the head of the government. From a quiet life and occupations he found himself all at once in the front rank of a wide-spread rebellion. An invasion from Mexico was constantly apprehended, and should it prove successful, while others would escape by reason of their insignificance, his head would be sure to fall. The two great parties, one in favour of keeping open the door of reconciliation with Mexico, and the other for immediate and absolute separation, were both urging him to carry out their views. The governor shrank from the hazard of extremes, was vacillating, undecided, and unequal to the emergency. In the mean time, the enthusiasm which led to the revolution, and which might have achieved independence, was wearing away."

From this sketch and from other information, which may be relied upon, the condition of the people of this Spanish republic, for self-government, does not encourage the hope of secure and peaceful administration.

The government of Yucatan has, since the deposition of Santa Anna, acted independently of Mexico. A separate customs' tariff has been published and acted upon, and whatever may hereafter be the destiny of this state, which, with an area of about 50,000 square miles, and a population variously estimated at from 450,000 to nearly 600,000 inhabitants, we need scarcely expect, nor can we desire, its re-annexation to the government of Mexico, which has hitherto exhibited so remarkable an incapacity for wise, or for efficient, administration. Since the commencement of the present war, between the United States of North America and Mexico, Yucatan has proclaimed its neutrality and independence.

TABLE of Statistics of Yucatan, obtained by Mr. Stephens.

DISTRICTS.	PRINCIPAL PLACES.	Parishes.		leag.	Popu- tion.	PRODUCTIONS.
		No.	No.			
Capital.....	Merida.....	4	5	..	37,801	Horned cattle, horses, mules, tallow, jerked beef, leather, salt, gypsum, hemp (raw and manufactured), straw hats, guitars cigars, and extract of logwood.
Campeachy.....	City of Campeachy.....	2	0	36	19,600	Salt, logwood, rice, sugar, and marble of good quality.
Lerma.....	Village of Lerma.....	3	8	37	10,567	Logwood, timber, rice, and fish oil.
Valladolid.....	City of Valladolid.....	11	17	36	63,164	Cotton, sugar, starch, gum-copal, tobacco, cochineal, saffron, vanilla, cotton-fabrics, yarns, &c., wax, honey, castor-oil, horned cattle, hogs, and skins.
Coast.....	City of Izamal.....	16	27	15	78,846	Horned cattle, horses, mules, tallow, jerked beef, castor-oil, hides, wax, honey, timber, indigo, hemp (raw and manufactured), straw-cigars, barilla, and salt.
The Upper Highlands...	City of Tekax.....	9	7	25	60,776	Horned cattle, horses, mules, hogs, sheep, skins, sugar, molasses, timber, rice, tobacco (in the leaf and manufactured), spirits, arrow-root, straw-hats, cotton-lace, ochre, flints, and grind-stones.
The Lower Hghlands...	Village of Teabo.....	8	5	17	42,188	Horned cattle, horses, mules, hogs, sheep, skins, tallow, dried beef, hemp (raw and manufactured), and cotton-lace.
The Upper Royal Road.	Town of Jeguelchakan..	5	11	26	54,447	Cattle, horses, mules, skins, tallow, dried beef, logwood, tobacco, sugar, and rum.
The Lower Royal Road.	Village of Maxcanu.....	5	7	14	41,726	Horned cattle, horses, mules, oil of palma Cristi, tobacco, hemp, and fine straw-hats.
The Upper "Beneficios"	Village of Ichmul.....	7	15	79	66,680	Sugar, molasses, rum, tobacco of good quality, rice, laces, pepper, gum copal, sarsaparilla, hats, hammocks, ebony, barilla, gypsum, and skins.
The Lower "Beneficios"	Village of Sotuta.....	6	16	22	49,443	Horned cattle, horses, mules, hogs, skins, tallow, and dried beef.
Tizimin.....	Village of Tizimin.....	7	18	41	37,168	Tortoise-shell, skins, timber, logwood, India-rubber, incense, tobacco, achioté (a substitute for saffron, and a very rich dye), starch from the <i>yucca</i> , cotton, wax, honey, molasses, sugar, rum, castor-oil, salt, amber, vanilla, hogs, and cochineal.
Island of Carmen.....	Town of Carmen.....	2	1	80	4,364	Logwood.
Seiba-Plaza.....	Village of Seiba-Plaza...	3	6	42	8,183	Timber, rice, logwood, and salt.
Bacalar.....	Town of Bacalar.....	2	0	88	3,986	Logwood, valuable timber, sugar of inferior quality, tobacco of the best description, rum, a fine species of hemp (known under the name of <i>pita</i> , resin, India-rubber, gum copal, pimento, sarsaparilla, vanilla, and gypsum.
Total.....	15	91	143	..	578,939	

POPULATION OF YUCATAN.

STATEMENT showing the Number of Inhabitants in the Five Departments into which the State is divided, distinguishing the Sexes; taken from the Census made by Order of the Government, of the 8th of April, 1841.*

DEPARTMENTS.	Men.	Women.	GRAND TOTAL.
	number.	number.	number.
Merida.....	48,606	58,663	107,269
Izamal.....	32,915	37,933	70,848
Tekax.....	58,127	64,957	123,144
Valladolid.....	45,353	46,926	92,279
Campeachy.....	39,017	40,639	79,656
Total.....	224,018	248,858	472,876

The best information goes to show that the population of the state cannot fall short of 600,000 souls.

* This census is probably not very exact, because, having continually the fear of new contributions, and detesting military service, every one reduces, as far as possible, the number of his family in the lists prepared for the Census. It appears to me that the total population of Yucatan may be fixed at 525,000 souls.—*P. de R.*

CHAPTER XLI.

AGRICULTURE, TRADE, AND MANUFACTURES OF YUCATAN.

MAIZE, or Indian corn, beans, pumpkins, squashes and camotes, a kind of potato, are the chief productions raised by the Maya or Indian population. Sugar-cane and hemp is cultivated on the haciendas. Horses, mules, cattle, hogs, and poultry, are reared ; the two latter chiefly by the Indians. Generally the state of agriculture and the implements are rude. Wax and honey is one of the rarest products, and on the road from Sisal to Merida, he met large carts drawn by mules, five abreast, with high wheels ten or twelve feet apart, and loaded with hemp, bagging, wax, honey, and ox and deer-skins.

The *débris* of the ruined cities are found to fertilise the soil and the ground around. Uxmal is consequently considered excellent for *milpas*, or maize-fields.

Legally there is no slavery in Yucatan. No man can either buy or sell another man ; but the poor thriftless Indians are generally compelled to attach themselves for necessities to some hacienda, and for the mere privilege of using the water. Mr. Stephens informs us that—

“ They come under certain obligations of service to the master, which place him in a lordly position, and this state of things growing out of the natural condition of the country, exists, I believe, nowhere in Spanish America except in Yucatan. Each hacienda has its major-domo, who attends to all the details of the management of the estate, and, in the absence of the master, is his viceroy, and has the same powers over the tenants. At this hacienda the major-domo was a young Mestitzo, and had fallen into his place in an easy and natural way by marrying his predecessor's daughter, who had just enough white blood to elevate the dulness of the Indian face into one of softness and sweetness ; and yet it struck me that he thought quite as much of the place he got with her as of herself.”

The attachment of the Indians to their home is said to be very great ; circumstances and habit bind the Indian and his wife together. He is seldom harsh to her,—if she is guilty of any great offence he brings her to the *alcalde*, who orders her to be whipped. He then goes quietly home with her. They share their labours and pleasures together, and with all their children attend village feasts.

THE MANUFACTURES OF YUCATAN are so very unimportant, that we can give no account of them further than that a few rude articles are made in the towns and haciendas ; that some coarse cutlery, and some coarse earthenware, and articles of leather and wood are made in the country. At the hacienda of Tankaché, amidst a logwood country, the proprietor has erected machinery for extracting the dye.

TRADE.—Of the trade we can say little, there being no accounts that we can discover kept of it. The logwood-trade and the turtle-fishery, and a few other articles, form the exports, and the imports of manufactured goods are subjected to the new tariff, which we have translated and introduced in the preceding

pages. Smuggling, chiefly by vessels from the United States, and from the British West Indies, is extensively carried on.

TURTLE FISHING.—There are three kinds of turtle which inhabit these seas; the *cahuamo*, the eggs of which serve for food, and which is useful besides only for its oil; the *tortuga*, of which the meat as well as the eggs is eaten, also produces oil, and the shell is worth two reals the pound; and the *karé*, of which the shell is worth ten dollars a pound.

Mr. Stephens observes,—

“I would not make any man unhappy, but the fishermen say that the turtle which forms the delight of the *gourmand* is of the commonest kind, not worth killing for the sake of the shell, and therefore sent away alive. The *karé* he has never tasted. It is killed for the sake of the shell, and eaten by the luxurious fishermen on the spot. I immediately negotiated with the patron for the purchase of the shell. The outer scales of the back, eight in number, are all that is valuable. Their weight is estimated at four pounds, and the price in Campeachy, he said, was ten dollars a pound.

“The arbor in which we lived was no protection, and we were obliged to go inside the hut, which was snug and comfortable, the oil-jars being arranged under the eaves, with turtle-shells tied up carefully in bundles, and on the rafters hung strings of eggs; while nets, old sails, blocks, and other characteristic furniture of a fisherman’s hut, filled up the corners. It was no hardship to be obliged to pass the afternoon among these fishermen, for their hardy, independent occupation gave manliness to their character and freedom to their speech and manners.”

THE TOWN OF LAGUNA stands on the island of Carmen, which is about twenty miles long, and which, with another island about twelve miles in length, separates the Lake of Terminos from the Gulf of Mexico. This port is the depôt of the great logwood country in the interior, and ten to twelve vessels are usually there loading cargoes for Europe and the United States. The town is well built, and said to be thriving; but its commerce has been greatly restricted by the oppressive regulations of the central government of Mexico; but having made a *pronunciamiento*, and disarmed and driven out the Mexican garrison, it is now considered independent, subject only to the state government of Yucatan.

SISAL.—This place has a roadstead which forms the port of Merida. Silan, Campeachy, and a few other places are frequented by the traders.

CHAPTER XLII.

DESCRIPTIVE SKETCHES OF YUCATAN.

YUCATAN appears to be, in many respects, less improved than Mexico, and far less romantic in its scenery than Central America. The inhabitants are described by Mr. Stephens as kindly disposed; and he says, on leaving Merida for the ruins of Mayapan,

"A friend accompanied us beyond the suburbs and put us into a straight road, which led, without turning, to the end of our day's journey: instead of the ominous warnings we were accustomed to receive in Central America, his parting words were, that there was no danger of robbers, or of any other interruptions."

He observes that no map of Yucatan, to be depended on, has ever been constructed. At the distance of a league from Merida, he passed a fine cattle hacienda, and the following sketches are illustrative of the country.

"We reached Timucui, a small village five leagues from Merida. This village consisted of a few Indian huts, built around a large open square, and on one side was a sort of shed for a *casa real*. It had no church or *cura*, and already we experienced a difficulty which we did not expect to encounter so soon. The population consisted entirely of Indians, who, in general, throughout the country speak nothing but the Maya; there was not a white man in the place, nor any one who could speak in any tongue we could comprehend. Fortunately, a muleteer from the interior, on his way to Merida, had stopped to bait his mules under the shade of a large tree, and was swinging in a hammock in the *casa real*. He was surprised at our undertaking, alone, a journey into the interior, seeing that we were brought to a stand at the first village from the capital; but finding us somewhat rational in other respects, he assisted us in procuring *ramon*, leaves and water, for the horses. His life had been passed in driving mules from a region of country called the Sierra, to the capital; but he had heard strange stories about foreign countries, and among others, that, in El Norte, a man could earn a dollar a day by his labour; but he was comforted when he learned that a *real* in his country was worth more to him than a dollar would be in ours; and as he interpreted to his nearly-naked companions, crouching in the shade, nothing touched them so nearly as the idea of cold and frost, and spending a great portion of the day's earnings for fuel to keep them from freezing. At three o'clock we left the hamlet, and at a little after four we saw the towers of the church of Tekoh. In the suburbs of this village we passed the Campo Santo, a large enclosure with high stone walls, over the gateway of which, and in niches along the top of the wall, was a row of human skulls. Inside the enclosure, at the farthest extremity, was a pile of skulls and bones, which, according to a custom of the Indians, observed from time immemorial, had been dug up from the graves and thrown into this shallow pit, a grim and ghastly charnel-house.

"The village consisted of a long, straight street, with houses or huts almost hidden by foliage, and inhabited exclusively by Indians. We rode up to the plaza without meeting a single person. At one side of the plaza, on a high stone platform, stood a gigantic church, with two lofty towers, and in front on each side was a broad flight of stone steps. Crossing the plaza, we saw an Indian woman, to whom we uttered the word *convento*, and, following the direction of her hand, rode up to the house of the *cura*. It was in the rear of the

church, and inclosed by a large wall. The gate was closed, but we opened it without knocking. The convent stood on the same platform with the church, and had a high flight of stone steps. A number of Indian servants ran out to the corridor to stare at such strange-looking persons, and we understood that the padre was not at home; but we were too well pleased with the appearance of things to think of going elsewhere. We tied our horses in the yard, ascended the steps, and strolled through the corridor of the convent and along the platform of the church, overlooking the village."

On Mr. Stephens' return he found the cura waiting to receive him. His curacy consisted of nearly 2000 souls, and, except his assistant, there was not a white man among this population.

The convent was a large stone building, with walls several feet thick, and in size corresponded with the church. Being so near Merida, it was well supplied with useful articles; among other things, the cura had a small collection of books, which, in Yucatan, constituted a library.

Mr. Stephens says;—"He relieved us of great difficulty, arising from the want of an interpreter, and, sending for the Indian *alcaldes*, made immediate arrangements to forward our luggage, and to accompany us himself the next day to the ruins of Mayapan. We had again made a beginning with the padres, and this beginning, in heartiness of welcome, and goodness of cheer, corresponded with all that we had before received at their hands. We had the choice of cot or hammock for the night, and at breakfast a group of Indian musicians were seated under the corridor, who continued making a noise, which they called *la musica*, till we mounted to depart.

"The cura accompanied us, mounted on one of the best horses we had seen in the country; and as it was a rare thing for him to absent himself a day from his parochial duties, he set out as for a holiday excursion, worrying our poor nags, as well as ourselves, to keep up with him.

"The royal road, the *Camino real*, itself, like most of the others which bore that name, would not be considered in other countries, as indicating a very advanced state of internal improvement, but the one into which we now struck was much rougher and more stony, entirely new, and in some places still unfinished. It had been but lately opened, and the reason of its being opened at all, illustrates one striking feature in the character of the Indians. The village to which it leads was under the pastoral charge of our friendly companion, and was formerly reached by a road, or rather path, so circuitous and difficult, that, on account of his other duties, he was obliged to give notice that he would be compelled to give it up. To prevent this calamity, all the Indians, in a body, turned out and made this new road, being a straight cut through the woods, two leagues in length."

This padre took a lively interest in the zeal of Mr. Stephens for exploring

the antiquities of the country, and told him that this particular region abounded with traces of ancient inhabitants.

The hacienda, or rather rancho, of San Joaquim, on which the ruins of Mayapan lie, is ten leagues south from Merida. It forms part of the great hacienda of Xanchakan, the property of Don José Maria Meneses, the venerable cura of San Cristoval, formerly *provesor* of the Church of Yucatan. Mr. Stephens had made his acquaintance at the house of Senor Rejon, secretary of state, and Don José sent instructions to his major domo, to place at his command all the disposable force of the hacienda.

Mr. Stephens says;—"In half an hour we came into a clear and open country, and at ten we entered the Camino real, for Jalacho, a broad and open road, passable for calesas. Up to this time we had not seen a single habitation, or met a human being, and now the road was literally thronged with people moving on to the fair, with whose clean garments my mud-stained clothes contrasted very unfavourably. There were Indians, Mestizoes, and white people, on horseback, muleback, and on foot, men, women, and children, many carrying on their backs things to sell in petaquillas, or long baskets of straw; whole families, sometimes half a village moving in company; and I fell in behind a woman perched on a loaded horse with a child in her arms, and a little fellow behind, his legs stretched out nearly straight, to span the horse's flanks, and both arms clasping her substantial body to keep himself from slipping off. We passed parties sitting in the shade to rest or eat, and females lying down by the roadside without any fear of molestation from the rest."

The villages visited by Mr. Stephens, were, he says, like all the others, "conspicuous for a large *plaza*, and church with two towers. Fairs are held in the country, the principal one at Yzamal, the next to it at Jalacho, on the road from Campeachy to Merida. Gambling is carried on at these fairs.

Among the haciendas that of Xanchakan is one of the finest in Yucatan, containing nearly 700 souls—the house is perhaps the best in the country, and being within one day's ride of the capital, and accessible by a *calesa*, it is a favourite residence of its proprietor.

Its cattle-yard, great tanks of water, and other accessories, were all upon a large and substantial scale. On the arrival of the cura the bell of the hacienda church was "toll'd to announce his arrival to the sick, to those who wished to confess, marry, or be baptised." Among other matters observed, "a dance of Indians was got up." On another occasion he witnessed the flogging of an Indian belonging to the hacienda. At the fair of Jalacho there were bull-fights and balls, horses, cotton, looking-glasses, songs, trays, baskets, and eatables, were among the articles bought and sold.

A line of *diligences*, imported from the United States, had been established between Campeachy and Merida. He complains much of the almost invisible

insects called *garrapatas*, which he designates the scourge of Yucatan. There is great scarcity of water throughout the country. The custody of the wells forms an important part of the administration of the village government, at the head of which is an *alcalde*, elected, and usually changed, annually. He observed that there was in the population an excess of females over males. The priests, although they never marry, have children, whom they call nieces or nephews. "At the ball," says Mr. Stephens, "one of the most personally attractive and lady-looking women was the *amiga* of a married man whose wife had left him; the best dressed and most distinguished young lady was the daughter of the *padre*, who, strictly speaking, never should have had any daughters; and husbands without wives, and wives without husbands, were mingling unrestrained among each other."

On another occasion, a beautiful young woman, whom Mr. Stephens had supposed to be a *Senorita*, was a *compremitada*, or *compagnora*, or to speak precisely, she was the *compagnora* of the *padre*, who sat on the other side.

"The *padres* generally throughout Yucatan, to relieve the tedium of convent life, have *compagnoras*, called *permanas politicas*, or sisters-in-law.

"Many of the white people could not speak Spanish, and the conversation was almost exclusively the Maya language." The *padrecito* was the best dancer at the ball, which was given in honour of a saint.

The *Casa real*, is a public building provided by the government in every village and town, for the *audiencia* and other municipal officers, and "like the *Cabeldo* of Central America, is intended to contain apartments for strangers."—These are generally miserable buildings. Mr. Stephens says he could not move without paying money for every thing.

The prevailing storm of the country is called El Norte. Throughout Yucatan, el campo, or the country, is considered unhealthy during the rainy season, and the proprietors of haciendas generally confined themselves to the towns and villages.

At one rancho of Maya Indians, near the village of Nohcacal, consisting of about 100 *labradores*, they worked, lived, and enjoyed their property in common, and always continued among each other within the rancho: rearing hogs, and cultivating milpa, or maize fields, was their chief occupation. The lands are their own. The products shared by all. Their food cooked in one hut; each family sending for its portion. Each member of which contributes in turn a hog. They want no converts. No stranger is allowed to enter their community. Each member marries within the rancho, and none ever married out of it. At another rancho, within the rude fence, inclosing the but of the *alcalde*, there were dogs, hogs, turkeys, and fowls, which, on strangers approaching, "barked, grunted, gobbled, and cackled. The yard was shaded with orange trees loaded with ripe and unusually large fruit."

There are four species of maguey or aloe, viz., the maguey which yields the pulque; the henneker, the fibres of which constitute the Sisal hemp; the salula, with which the Indian women wean their children, by placing the leaves, the taste of which is disagreeable and bitter, over the breast; and the petal, which has large leaves, and of which fine white hemp is made.

SUGAR CULTIVATION might be carried on to great advantage in many parts of Yucatan: especially along the sea coast, where there is now not a settlement below Ascension round to Sisal. From Campeachy to Tabasco, he considers the whole line of coast admirably adapted for cultivating sugar-canes. Next, in respect to labour, that of the Indians, is said to be quite equal to that of Negroes, and Indians for labour may, says Mr. Stephens, "be procured at a real per day, which is less than the interest upon the cost of a negro, and less than the cost of maintaining him, if he cost nothing." At a distance of a league from the hacienda of Jalasac, which is in the interior country and estimated at twenty-two leagues nearly due south from the Port of Campeachy, "the road ran through a plaza, or square, with large seybo trees in the centre, and neat white houses on all the sides, and before the door of one of these we saw a horse and cart, an evidence of civilisation we had not seen till that time in all the country." This was Senor Trego's sugar hacienda. "He had large sugar works, and a distillery for the manufacture of *habanera*; and in the yard of the latter was a collection of enormous black hogs taking a siesta in a pool of mud, most of them with their snouts barely above water—a sublime spectacle for one interested in their lard and tallow." There was a well dug 600 feet in the yard, but not deep enough for water.

Near Tekax (one of the few places in Yutacan bearing the name of city), Mr. Stephens travelled on a *Camino real*, and met heavy lumbering vehicles, drawn by oxen and horses, carrying sugar from the *haciendas*. On journeying from Chemax to Yalohao on-the-Sea, about twenty-four leagues, the road was lonely, rugged, and mostly a complete crust of stone. Yalohao, which has a small settlement of huts was formerly a resort of pirates, afterwards the haunt of smugglers.

When at *Chichen*, examining the extraordinary ruins of that place, he found the danger apprehended from the rainy season, was coming to pass, "and under an anticipation of a failure of the next crop, corn had risen from two reals to one dollar the load. The distress occasioned in this country by the failure of the corn crop cannot well be imagined. In 1836 this calamity occurred, and from the same cause that threatened to produce it now. Along the coast a supply was furnished from the United States, but it would not bear the expense of transportation into the interior, and in this region corn rose to four dollars a load, which put the staff of life completely beyond the reach of the Indians. Famine ensued, and the poor Indians died of starvation. At the time of our

arrival, the criados, or servants of the hacienda, always improvident, had consumed their small stock, and, with no hope from their milpas, with the permission of the master, were about moving away to regions where the pressure would be less severe. Our arrival, as the major-domo told us, arrested this movement; instead of our being obliged to hunt them up, the poor Indians crowded round the door of our hut, begging employment and scrambling for the reales which Albino distributed among them; but all the relief we could afford them was of short duration, and it may not be amiss to mention that at the moment of writing the calamity apprehended has come to pass; the ports of Yucatan are thrown open, and that country in which, but a few short months since, we were moving so quietly, and experiencing continual acts of kindness, is now groaning under famine, superadded to the horrors of war."

VALLADOLID.—He entered this place near the great church with its convent and cloisters attached, and a square in front; which, as he rode across it, sounded hollow under his horses' feet, and underneath was an immense senote. He passed up the Calle de Sisal, a long street with straggling houses on each side, and was directed to the house of Don Pedro Baranda, one of the largest and best in the place.

This town was founded at an early period after the conquest. It contains about 15,000 inhabitants, and is distinguished as the residence of the vicar-general of the church of Yucatan.

"It was built," says Mr. Stephens, in a style commensurate with the lofty pretensions of the conquerors, and like other cities of Spanish America bears the marks of ancient grandeur, but is now going to decay. The roads leading to it and the very streets are overgrown with bushes. The parochial church still stands, the principal object in the Plaza, and the churches of San Servacia, San Juan de Dios, Santa Lucia, Santa Anna, La Virgin de la Candelaria, and the Church of Sisal, the largest buildings in the city, are all more or less dilapidated.

"The same melancholy tokens are visible in the private houses. In the principal street stand large buildings, roofless, without window or doors, and with grass and bushes growing from crevices in the walls; while here and there, as if in mockery of human pride, a tottering front has blazoned upon it the coat-of-arms of some proud Castilian, distinguished among the daring soldiers of the conquest, whose race is now entirely unknown.

A COTTON FACTORY.—"Among these time-shattered buildings in Valladolid, stood one of striking contrast, remarkable for its neat, compact, and business-like appearance, and in that country it seemed a phenomenon. It was a cotton-factory belonging to Don Pedro Baranda, the first established in the Mexican republic, and for that reason, as emblematic of the dawn of a great manufacturing system, called the 'Aurora de la Industria Yucateca,' and what gave it a greater interest in our eyes, it was under the direction of that young countryman and fellow-citizen, Don

Juan Burgue, or Mr. John Burke, to whom I before referred, as the first stranger who visited the ruins of Chichen. It seemed strange to meet in this unknown, half-Spanish, half-Indian town, a citizen of New York. It was seven years the day of our arrival since he came to Valladolid. He had almost lost the facility of expressing himself in his native tongue, but in dress, manner, appearance, and feelings he was unchanged, and different from all around him; and it was gratifying to us to know that throughout that neighbourhood it was no small recommendation to be the countryman of 'the engineer.'

"Retired from office, and unable to endure idleness, the spontaneous growth of cotton around Valladolid induced Don Pedro to undertake the establishment of a cotton-factory. He had great difficulties to contend with, and these began with the erection of the building. He had no architect to consult, and planned and constructed it himself. Twice the arches gave way, and the whole building came down. The machinery was imported from the United States, accompanied by four engineers, two of whom died in the country. In 1835, when Mr. Burke arrived, the factory had yielded but seventy pieces of cotton, and eighteen yards had cost 8,000 dollars. At this time the office of acting governor of the state devolved upon him, but by a political revolution he was deposed; and while his workmen were celebrating the Grito de Dolores, which announced the outbreak of the Mexican revolution, they were arrested and thrown into prison, and the factory was stopped for six months. It was afterwards stopped twice by a failure of the cotton crop, and once by famine; and all the time he had to struggle against the introduction of smuggled goods from Belize, but in spite of all impediments it had gone on, and was then in successful operation.

"In walking about the yard, Don Pedro led us to the wood pile, and showed us that the logs were all split into four pieces. This wood is brought by the Indians in back-loads at a medio per load, and Don Pedro told us that at first he had requested the Indians not to split the logs as he would rather have them entire, but they had been used to do so, and could not alter their habits. Yet these same Indians, by discipline and instruction, had become adequate to all the business of the factory."

The city of Valladolid had formerly much notoriety, from its credulous inhabitants believing it was the residence of a *Demonio Parlero*, or a "talking devil," who talked, laughed, played the guitar, threw stones into garrets, and eggs at young women, and played the most mischievous tricks, without allowing himself to be seen. More recently it claims the honour of being the place at which the first blow was struck in the revolution against the dominion of Mexico, and also as being the residence of its conductor, General Juan.

TEKAX stands at the foot of the sierra. "Riding up the street," Mr. Stephens says, "we had in full view the church of La Hermita, with a broad flight of stone steps scaling the side of the mountain. The streets were wide, the houses large and in fine order, and one had three stories with balconies over-

hanging the street; and there was an appearance of life and business which, coming as we did from Indian ranchos, and so long away from any thing that looked like a city and the comforts and elegances of living, was really exciting. We stopped in the Plaza, which, with its great church and buildings around it, was the finest we had seen in the country, and all the people ran out to the corridors to gaze at us. It was an unprecedented thing for strangers to pass through this place. European saddles, holsters, and arms were strange, and including Albino, we made the cabalistic number of three, which got up the late revolution.

MÉRIDA.—The population of this city, the capital of Yucatan, Mr. Stephens estimates at about 23,000. It stands on a great plain of limestone rock, and the temperature and climate are described as uniform. The houses are low, but said to be well built, with balconies; the streets clean, and many of the inhabitants well dressed, and the ladies drive about in caleches. It has also an hotel.

The distinguishing features of Merida, as of all the cities of Spanish-America, are its churches; the principal of which are the great cathedral; the parish church and convent of San Cristoval; the church of the Jesuits; the church and convent of the Mejorada; the chapels of San Juan Bantista; of our Lady of Candelaria; of the Santa Lucia, and the Virgin; and the Convent de las Monjas, or the nunnery with its church and enclosures occupying two whole squares, all interesting in their history. It has a public walk, or alameda, bull-fights, horse races, and various amusements—as theatrical concerts, processions, festivities, grand masses, and cock-fights, all considered as amusements. They have various balls or dances by day as well as by night.

ROADS.—Mr. Stephens informs us that “the whole triangular region from Valladolid to the Bay of Ascension, on one side, and the post of Yalahao, on the other, is not traversed by a single road, and the rancho of Molas is the only settlement along the coast. It is a region entirely unknown, no white man ever enters it. Ruined cities no doubt exist; and young Molas told us of a large building, many leagues in the interior, known to an old Indian, covered with paintings in bright and vivid colours, and the subjects of which were still perfect. With difficulty we contrived to see this Indian, but he was extremely uncommunicative; said it was many years since he saw the building; that he had come upon it in the dry season while hunting, and should not be able to find it again. It is my belief that within this region, cities, like those we have seen in ruins, were kept up and occupied for a long time, perhaps one or two centuries, after the conquest; and that down to a comparatively late period, Indians were living in them, the same as before the discovery of America. In fact, I conceive it to be not impossible that within this secluded region may exist at this day, unknown to white men, a living aboriginal city, occupied by relics of the ancient race, who still worship in

the temples of their fathers. We had now finished our voyage along the coast, and the end which we had in view was fully accomplished. We had seen, abandoned and in ruins, the same buildings which the Spaniards saw entire and inhabited by Indians, and we had identified them beyond question as the works of the same people who created the great ruined cities over which, when we began our journey, hung a veil of seemingly impenetrable mystery. At that time we believed the discovery and comparison of these remains to be the surest, if not the only, means of removing this veil; and though other proofs had accumulated upon us, these were not, on that account, the less interesting."

In the Lake of Peten there are numerous islands. On the largest, at one time, stood the royal city of the ancient province of Itza, which was conquered by the Spaniards, accompanied by an extraordinary slaughter of the inhabitants.

West of Peten, and extending to the Spanish towns of Central America, is the region of the Lancadores, on which it is said the foot of a white man never trod.

Mr. Stephens observes;—"The condition of Yucatan, in regard to medical aid, is deplorable. The curas attend to the sick; but except at Merida and Campeachy, there are no regular educated physicians or surgeons."

AGUADOS.—These are generally large ponds covered with greenish water plants. They are considered as artificial by Mr. Stephens; and all considered them as the work of the *Antiguos*. This was proved by the cleansing of an aguado by Señor Trego, in 1836; by the procuring of from 1000 to 1500 Indian labradores, or labourers. On cleaning out the mud, he found an artificial bottom of flat stones, overlapped, and the interstices between them rendered tight by clay. Near the centre of the bottom were four wells, about five feet in diameter, faced with smooth stone; and along the margin, 400 cussimbus, or pits, into which the water filtered, and, with the wells, intended to furnish a supply of water when the aguado should be dry. The aguado fills in the rainy season. On the occurrence of a recent dry season, Senor Trego said all the country around was destitute of water; and families came to establish themselves for the time on the banks of this aguado. Other aguados have been cleared out, and found to have been artificial.

SENOTES.—The *senotes* differ from the aguados materially; the former are immense circular excavations, from sixty to two hundred feet in diameter, with broken rocky, perpendicular sides; from fifty to one hundred feet deep, and having at the bottom a great body of water, of unknown depth, always about the same level, supposed to be supplied by subterraneous rivers. There are two great *senotes* around the ruins of *Chichen*, which possibly might have been the cause of founding that ancient city.

RUINS OF YUCATAN.—With reference to those remarkable ruins, of which Mr. Stephens gives such an interesting description, he says,—“My opinion on this question has been fully and freely expressed, that they are not the works of people who have passed away, and whose history is lost, but of the

same races who inhabited the country at the time of the Spanish conquest, or of some not very distant progenitors. Some were probably in ruins but, in general, I believe that they were occupied by the Indians at the time of the Spanish invasion. The grounds of this belief are interspersed throughout these pages; they are interwoven with so many facts and circumstances, that I do not recapitulate them; and in conclusion, I shall only refer briefly to those arguments which I consider the strongest that are urged against this belief.

“The first is the entire absence of all traditions. But, I would ask, may not this be accounted for by the unparalleled circumstances which attended the conquest and subjugation of Spanish America? Every captain, or discoverer, on first planting the royal standard on the shores of a new country, made proclamation, according to a form drawn up by the most eminent divines and lawyers in Spain, the most extraordinary that ever appeared in the history of mankind; entreating and requiring the inhabitants to acknowledge and obey the church as the superior and guide of the universe, the holy father, called the pope, and his majesty as king and sovereign lord of these islands, and of the *terra firma*; and concluding, ‘but if you will not comply, or maliciously delay to obey my injunction, then, with the help of God, I will enter your country by force; I will carry on war against you with the utmost violence; I will subject you to the yoke of obedience, to the church and king; I will take your wives and children, and make them slaves, and sell or dispose of them according to his majesty’s pleasure; I will seize your goods, and do you all the mischief in my power, as rebellious subjects, who will not acknowledge or submit to their lawful sovereign; and I protest, that all the bloodshed and calamities which shall follow are to be imputed to you, and not to his majesty, or to me, or the gentlemen who serve under me.’

“The conquest and subjugation of the country were carried out in the unscrupulous spirit of this proclamation. The pages of the historians are dyed with blood; and, sailing on the crimson stream with, as master-pilot at the helm, appears the leading, stern, and steady policy of the Spaniards, surer and more fatal than the sword, to subvert all the institutions of the natives, and to break up and utterly destroy all the rites, customs, and associations that might keep alive the memory of their fathers and their ancient condition.

“The graves cry out for the old historians, and the mouldering skeletons of cities confirm Herrera’s account of Yucatan, that ‘there were so many and such stately stone-buildings, that it was amazing; and the greatest wonder was, that, having no use of any metal, they were able to raise such structures, which seem to have been temples, for their houses were all of timber, and thatched.’ And again, he says, that ‘for the space of twenty years there was such plenty throughout the country, and the people multiplied so much, that men said the whole province looked like one town.’”

CHAPTER XLIII.

BRITISH HONDURAS, OR BELIZE.

THE British district of Belize extends along the eastern coast of Yucatan, between 15 deg. 54 min. and 18 deg. 30 min. north latitude, and 88 deg. and 90 deg. west longitude. It is separated from Yucatan by the Rio Hondo, and its southern boundary is formed by the river Sarstoon, which falls into the Gulf of Honduras, not more than twenty miles west of the mouth of the Rio Dulce. Belize is in length about 175 miles from north to south, and 110 miles from east to west, and occupies an area of about 16,400 square miles.

It is termed British Honduras, but it is geographically a part of the Peninsula of Yucatan. About three years after the conquest of Jamaica in 1656, the English frequented Yucatan to cut and carry away logwood; and the British settlements in that country were originally settled with the free consent of the aboriginal and independent possessors of the country. The English maintained their settlements as regular occupants, under the government of Jamaica, in the year 1669. The English first visited, to cut logwood, the uninhabited coasts of Yucatan about 1662, and the privileges of cutting logwood were stipulated for with Spain in the treaty of 1670, usually called the American treaty. Two years afterwards these stipulations were violated. The first settlements were made near Cape Catoche, then at the Laguna de Terminos in Campeachy. The Spaniards in 1672, captured all English vessels which they found carrying logwood. In 1680, the English were expelled by a Spanish force from the Laguna de Terminos.

In consequence of the king's command, Sir Thomas Lynch, governor of Jamaica, transmitted to King Charles II., in 1671, a report on the British settlements and trade in Yucatan, in which he states, "That the English had done every act that constituted a right of possession in the first settlers; and that the Spanish American treaty in 1670, had removed all possible doubts, by establishing the *possidetis uti*, with full rights of sovereignty, in all places held prior to that time." In regard to trade, "he stated its importance to be such, as annually increased his majesty's customs, and the national commerce, more than any other of his majesty's colonies." In 1672, Sir Thomas Modyford, the succeeding governor of Jamaica, addressed the lords of the privy council upon the same subject; in which he also vindicated the British right to the country, and submitted to their observation a proclamation, which he had issued for the regulation and security of the settlement; upon which he received their lordships' approbation of what he had done.*

* See Report, made by the Board of Trade and Plantations, in the year 1717.—This report states at great length the extent of the trade and of the British settlements in Yucatan. This year

The Board of Trade's report states the great importance of the trade to our navigation, and to the North American colonies: that the settlements appeared to the Board a possession granted by the American treaty (as the treaty of 1670 with Spain was called); that the Spaniards had not at that time made any complaints against them; and that the trade will employ more than 100 sail of ships annually, and bring in more to his majesty's customs than any colony he hath. The Board also entered fully into all the natural resources of the district.

This settlement continued from 1717, uniformly in the full right, property, and possession, not only of the east shore of Yucatan, but of its rivers and of its wood-trade; and maintained the free and independent sovereignty of Great Britain over the same, in the form of a British settlement, under the government, control, and direction, of his majesty's governor of Jamaica, until the peace of Paris, 1763. At this time, his majesty, by the 17th article of that treaty,* voluntarily relinquished the sovereignty of these settlements in favour of the King of Spain; who, by the same article, "plighted his royal promise and good faith, to protect his majesty's subjects in the full enjoyment and continuation of their rights, in carrying on the said wood-trade." In this situation his majesty's subjects continued to occupy and possess the country, until September, 1779; when, in breach of this, and former articles of treaty, the subjects and forces of his Catholic Majesty surprised, robbed, and pillaged the whole British settlers of their property, and seized on the persons of all of them, on whom they could lay hold, blindfolded some, put others in irons; carried or made them walk to Merida, and then sent them as prisoners to the Havanna, where they were confined until about the month of July, 1782, when they were permitted to return to Jamaica.

We scarcely can find any case of greater injustice, than the neglect on the part of those who negotiated the treaty of peace of 1783, of not adjusting the

(1717) the first armed ship sent by the South Sea Company, the *Royal Prince*, was laden with British manufactures, and sailed for Vera Cruz. The Spanish ambassador, the Marquis de Monteleone, protested against the British settlements at the Isle of Triste, Laguna de Terminos, and Campeachy, declaring, that if in the course of eight months they do not leave the said places, they shall be treated as pirates.

* By the 17th article of that treaty, it was stipulated between the two sovereigns as follows: viz.

"His Britannic Majesty shall cause to be demolished all the fortifications which his subjects shall have erected in the Bay of Honduras, and other places of the territory of Spain in that part of the world, four months after the ratification of the present treaty: And his Catholic Majesty shall not permit his Britannic Majesty's subjects, or their workmen, to be disturbed or molested, under any pretence whatsoever, in the said places in their occupation of cutting, loading, and carrying away logwood; and for this purpose they may build without hindrance, and occupy without interruption, the houses and magazines necessary for them, for their families, and for their effects: And his Catholic Majesty assures to them, by this article, the full enjoyment of those advantages and powers on the Spanish coasts and territories, as above stipulated, immediately after the ratification of the present treaty."

By this article (the fortifications being demolished) his Catholic Majesty engaged to protect the British subjects during their residence in, and occupation of, that country. He further engaged (by the reciprocal article, No. 36, of the treaty of Madrid, of the 13th and 23rd day of May, 1667, and which has been uniformly made a part of every subsequent treaty between the two nations), that in case of war, "Notice should be given to the respective subjects thereof; that is to say, the space of six months, to transport their merchandise and effects, without giving them in that time any molestation or trouble, or retaining or embarking their goods or persons." These treaties were confirmed by parliament, which afforded the most decided national protection to all the subjects interested in the commerce of Yucatan.

equitable claims of British subjects, for the atrocious destruction to the value, at least, of 100,000*l.* sterling of British property in Yucatan. The neglect was so shameful, that ministers would not even allow the petitions to be received in parliament. Such were the rights of colonists, to petition for the redress of grievances, in the reign of George III.

How far Yucatan can pretend to any right over Belize, or Central America to the Mosquito Shore, is a question for public jurists to decide—we deny any such right; Spain has relinquished all sovereignty, and Great Britain is the only European power which has ever occupied Belize and the Mosquito Shore; that too, not by conquest, but with the original consent of the primitive occupants. The right to Belize by occupation, and possession is, therefore, undoubtedly vested in the British crown.*

* The sixth Article of the Treaty of Versailles, September 3, 1783, is as follows:—

“The intention of the two High Contracting Parties being to prevent, as much as possible all the causes of complaint and misunderstanding heretofore occasioned by the cutting of wood for dyeing, or logwood; and several English settlements having been formed and extended, under that pretence, upon the Spanish continent, it is expressly agreed, that his Britannic Majesty’s subjects shall have the right of cutting, loading, and carrying away logwood, in the district lying between the rivers Wallis or Belize, and Rio Hondo, taking the course of the said two rivers for unalterable boundaries, so as that the navigation of them be common to both nations, to wit, by the river Wallis or Belize, from the sea, ascending as far as opposite to a lake or inlet which runs into the land and forms an isthmus, or neck, with another similar inlet, which comes from the side of Rio Nuevo, or New River; so that the line of separation shall pass straight across the said isthmus, and meet another lake formed by the water of Rio Nuevo, or New River, at its current. The said line shall continue with the course of Rio Nuevo, descending as far as opposite to a river, the source of which is marked in the map, between Rio Nuevo and Rio Hondo, and which empties itself into Rio Hondo; which river shall also serve as a common boundary as far as its junction with Rio Hondo, and from thence descending by Rio Hondo to the sea, as the whole is marked on the map which the plenipotentiaries of the two crowns have thought proper to make use of, for ascertaining the points agreed upon, to the end that a good correspondence may reign between the two nations, and that the English workmen, cutters, and labourers, may not trespass from an uncertainty of the boundaries. The respective commissaries shall fix upon convenient places, in the territory above marked out, in order that his Britannic Majesty’s subjects, employed in the felling of logwood, may, without interruption, build therein houses and magazines necessary for themselves, their families, and their effects; and his Catholic Majesty assures to them the enjoyment of all that is expressed in the present Article; provided that these stipulations shall not be considered as derogating in any wise from his rights of sovereignty. Therefore all the English who may be dispersed in any other parts, whether on the Spanish continent, or in any of the islands whatsoever, dependent on the aforesaid Spanish continent, and for whatever reason it might be, without exception, shall retire within the district which has been above described, in the space of eighteen months, to be computed from the exchange of the ratifications; and for this purpose orders shall be issued on the part of his Britannic Majesty; and on that of his Catholic Majesty, his governors shall be ordered to grant to the English, dispersed, every convenience possible for their removing to the settlement agreed upon by the present Article, or for their retiring wherever they shall think proper. It is likewise stipulated, that if any fortifications should actually have been heretofore erected within the limits marked out, his Britannic Majesty shall cause them all to be demolished, and he will order his subjects not to build any new ones. The English inhabitants, who shall settle there for the cutting of logwood, shall be permitted to enjoy a free fishery for their subsistence, on the coasts of the district above agreed on, or of the islands situated opposite thereto, without being in any wise disturbed on that account; provided they do not establish themselves in any manner on the said islands.

“Immediately after the exchange of the ratifications, the two High Contracting Parties shall name commissaries to treat concerning new arrangements of commerce between the two nations, on the basis of reciprocity and mutual convenience; which arrangements shall be settled and concluded within the space of two years, to be computed from the 1st of January, 1784.

“Done at Versailles, the 3rd of September, 1783.”

British Declaration.—“The new state in which commerce may perhaps be found, in all parts of the world, will demand revisions and explanations of the subsisting treaties; but an entire abro-

The shores of British Honduras are lined with numerous islands, or coral keys. They are covered with cocoa-nut trees and bushes, and resorted to by the fishermen to take turtle. The largest are Ambergrease Key, towards the north, and Turneff, opposite the town of Belize. These two keys consist of clusters of several small islands divided by narrow creeks and lagoons. A smaller key, called St. George's, is resorted to by the merchants of Belize, who have dwelling-houses on it. The shores of the continent are rocky, but low, except towards the south,

gation of those treaties, in whatever period it might be, would throw commerce into such confusion as would be of infinite prejudice to it.

"In some of the treaties of this sort, there are not only Articles which relate merely to commerce, but many others which ensure reciprocally, to the respective subjects, privileges, facilities for conducting their affairs, personal protections, and other advantages, which are not, and ought not to be of a changeable nature, such as the regulations relating merely to the value of goods and merchandise, variable from circumstances of every kind.

"When, therefore, the state of the trade between the two nations shall be treated upon, it is requisite to be understood that the alterations which may be made in the subsisting treaties are to extend only to arrangements merely commercial; and that the privileges and advantages, mutual and particular, be not only preserved on each side, but even augmented, if it can be done.

"In this view, his Majesty has consented to the appointment of commissaries, on each side, who shall treat solely upon this object."

Spanish Counter-Declaration.—The Catholic King, in proposing new arrangements of commerce, has had no other design than to remedy, by the rules of reciprocity and mutual convenience, whatever may be defective in preceding treaties of commerce. The King of Great Britain may judge from thence, that the intention of his Catholic Majesty is *not in any manner to cancel all the stipulations contained in the above-mentioned treaties*: he declares, on the contrary, from henceforth, that he is disposed to maintain all the privileges, facilities, and advantages, expressed in the old treaties, as far as they shall be reciprocal, or compensated by equivalent advantages. It is to attain this end, desired on each side, that commissaries are to be named to treat upon the state of trade between the two nations, and that a considerable space of time is to be allowed for completing their work. His Catholic Majesty hopes that this object will be pursued with the same good faith, and with the same spirit of conciliation, which have presided over the discussion of all the other points included in the definitive treaty; and his said Majesty is equally confident that the respective commissaries will employ the utmost diligence for the completion of this important work.

The following Articles of Convention between Great Britain and Spain, signed at London, the 14th of July 1786, relate to the extension of the limits of Belize.

I. His Britannic Majesty's subjects, and the other colonists who have hitherto enjoyed the protection of England, shall evacuate the country of the Mosquitos, as well as the continent in general, and the islands adjacent, without exception, situated beyond the line hereinafter described, as what ought to be the frontier of the extent of territory granted by his Catholic Majesty to the English, for the uses specified in the 3rd article of the present Convention, and in addition to the country already granted to them in virtue of the stipulations agreed upon by the commissaries of the two crowns in 1783.

II. The Catholic King, to prove, on his side, to the King of Great Britain, the sincerity of his sentiments of friendship towards his said Majesty and the British nation, will grant to the English more extensive limits than those specified in the last treaty of peace: and the said limits of the lands added by the present convention shall for the future be understood in the manner following:

The English line, beginning from the sea, shall take the centre of the river Sibun or Jabon, and continue up to the source of the said river: from thence it shall cross in a straight line the intermediate land, till it intersects the river Wallis; and by the centre of the same river, the said line shall descend to the point where it will meet the line already settled and marked out by the commissaries of the two crowns in 1783: which limits, following the continuation of the said line, shall be observed as formerly stipulated by the definitive treaty.

III. Although no other advantages have hitherto been in question, except that of cutting wood for dyeing, yet his Catholic Majesty, as a greater proof of his disposition to oblige the King of Great Britain, will grant to the English the liberty of cutting all other wood, without even excepting mahogany, as well as gathering all the fruits, or produce of the earth, purely natural and uncultivated, which may, besides being carried away in their natural state, become an

where they are rather high and intersected by deep ravines. The river Belize flows down from an unexplored region. The low country near the sea is, in many parts, swampy, and partially covered with stagnant waters, nearly the whole year round—and during the rains it is completely covered. The higher grounds further inland

object of utility or of commerce, whether for food or for manufactures; but it is expressly agreed that this stipulation is never to be used as a pretext for establishing in that country any plantation of sugar, coffee, cocoa, or other like articles; or any fabric or manufacture by means of mills or other machines whatsoever, (this restriction, however, does not regard the use of saw mills, for cutting or otherwise preparing the wood,) since all the lands in question being indisputably acknowledged to belong of right to the crown of Spain, no settlements of that kind, or the population which would follow, could be allowed. The English shall be permitted to transport and convey all such wood, and other produce of the place, in its natural and uncultivated state, down the rivers to the sea, but without ever going beyond the limits which are prescribed to them by the stipulations above granted, and without thereby taking an opportunity of ascending the said rivers, beyond their bounds, into the countries belonging to Spain.

IV. The English shall be permitted to occupy the small island known by the names of Casina, St. George's Key, or Cayo Casina, in consideration of the circumstance of that part of the coasts opposite to the said island being looked upon as subject to dangerous disorders; but this permission is only to be made use of for purposes of real utility: and as great abuses, no less contrary to the intentions of the British government, than to the essential interest of Spain, might arise from this permission, it is here stipulated, as an indispensable condition, that no fortification, or work of defence whatever, shall at any time be erected there, nor any body of troops posted, nor any piece of artillery kept there; and in order to verify with good faith the accomplishment of this condition *sine quâ non* (which might be infringed by individuals, without the knowledge of the British government), a Spanish officer or commissary, accompanied by an English commissary or officer, duly authorised, shall be admitted, twice a year, to examine into the real situation of things.

V. The English nation shall enjoy the liberty of refitting their merchant-ships in the southern triangle, included between the point of Cayo Casina, and the cluster of small islands, which are situated opposite that part of the coast occupied by the cutters, at the distance of eight leagues from the River Wallis, seven from Cayo Casina, and three from the river Sibun, a place which has always been found well adapted to that purpose. For which end the edifices and storehouses, absolutely necessary for that service, shall be allowed to be built; but in this concession is also included the express condition of not erecting fortifications there at any time, or stationing troops, or constructing any military works; and in like manner it shall not be permitted to station any ships of war there, or to construct an arsenal, or other building, the object of which might be the formation of a naval establishment.

VI. It is also stipulated, that the English may freely and peaceably catch fish on the coast of the country assigned to them by the last treaty of peace, as also of that which is added to them by the present convention; but without going beyond their boundaries, and confining themselves within the distance specified in the preceding article.

VII. All the restrictions specified in the last treaty of 1783, for the entire preservation of the right of the Spanish sovereignty over the country, in which is granted to the English only the privilege of making use of the wood of the different kinds, the fruits and other produce in their natural state, are here confirmed; and the same restrictions shall also be observed with respect to the new grant. In consequence, the inhabitants of those countries shall employ themselves simply in the cutting and transporting of the said wood, and in the gathering and transporting of the fruits, without meditating any more extensive settlements, or the formation of any system of government, either military or civil, further than such regulation as their Britannic and Catholic Majesties may hereafter judge proper to establish, for maintaining peace and good order amongst their respective subjects.

VIII. As it is generally allowed that the woods and forests are preserved, and even multiply, by regular and methodical cuttings, the English shall observe this maxim, as far as possible; but if, notwithstanding all their precautions, it should happen in course of time that they were in want of dyeing wood, or mahogany, with which the Spanish possessions might be provided, the Spanish government shall make no difficulty to furnish a supply to the English at a fair and reasonable price.

IX. Every possible precaution shall be observed to prevent smuggling; and the English shall take care to conform to the regulations which the Spanish government shall think proper to establish amongst their own subjects, in all communications which they may have with the latter; on condition, nevertheless, that the English shall be left in the peaceable enjoyment of the several advantages inserted in their favour in the last treaty, or stipulated by the present convention.

have a sandy soil, and are chiefly overgrown with different kinds of pine, which supplies excellent timber. The valleys, which intersect the high lands, have a very fertile soil, and are covered with various species of tropical trees. South of the river Belize, the low country is thickly wooded, but it does not extend more than from three to six miles inland, behind which mountains arise. The country, comprising the mountain slopes and valleys, and the interior country, is covered with forests, and the soil is said to be very fertile.

The rivers are navigable from twenty to thirty miles from their mouths, but higher up they are interrupted by rapids and falls. Mahogany, dye-wood, and timber are floated down by these rivers. The most remarkable of which are, the Rio Hondo, the New River, the Belize, and the Siboon. On the banks of the latter there are extensive forests of mahogany. The Belize probably winds for more than 150 miles in its length. The Hondo is the most navigable river.

The climate is a compound of heat and moisture, yet Belize is considered more healthy than most of the West India islands. The mean annual temperature is 80 deg., but it is seldom oppressive, as from the beginning of July to the beginning of April, the air is refreshed by sea-breezes. From April to July is the dry season, during which the heat is excessive, but it is from time to time tempered by thunder-storms. During the remainder of the year rains are frequent, especially in July, August, and September. In the beginning of October the north winds commence, and generally continue with little variation to February or March, when the weather becomes extremely variable.

The soil is remarkably fertile. Sugar, coffee, cotton, and indigo might all be extensively raised, but their culture has been nearly altogether neglected. Arrow-root and rice are grown to a small extent. Cochineal is brought in and exported. Plantains, yams, mandioca, and maize, are grown for food. The most common fruits are oranges, lemons, limes, shaddocks, mangoes, guavas, cashew-nuts, tamarinds, avocado-pears, pomegranates, wild plums, and grapes. A few garden vegetables are cultivated. In the forests many varieties of trees abound, as cabbage-trees, cedars, pines, iron-wood, silk-cotton trees, log-wood, fustic, and brasiletto; and the most important of all, the mahogany tree. Sarsaparilla is collected in the southern districts. The wild animals are ounces, panthers, tapirs, deer, antelopes, peccaries and warrees

XI. Their Britannic and Catholic Majesties, in order to remove every kind of doubt with regard to the true construction of the present convention, think it necessary to declare that the conditions of the said convention ought to be observed according to their sincere intention to insure and improve the harmony and good understanding which so happily subsist at present between their said Majesties.

In this view his Britannic Majesty engages to give the most positive orders for the evacuation of the countries above mentioned, by all his subjects of whatever denomination; but if, contrary to such declaration, there should still remain any persons so daring as to presume, by retiring into the interior country, to endeavour to obstruct the evacuation already agreed upon, his Britannic Majesty, so far from affording them the least succour, or even protection, will disavow them in the most solemn manner, as he will equally do those who may hereafter attempt to settle upon the territory belonging to the Spanish dominion.

(animals of the hog kind), caviés, agoutis, armadilloes, opossums and racoons; monkeys are numerous, and some of them are eaten. Manatis and alligators are met with in the lagoons along the coast. Among the numerous birds are turkeys, spoon-birds, toucans, Muscovy ducks, two species of macaws, and many kinds of parrots, pelicans, and humming-birds. Fish are plentiful and of various kinds; some are very large. Fish and turtle are used as substitutes for meat. Lobsters and shell-fish are abundant and excellent. Cattle, sheep, and goats are kept, but not sufficient for the consumption. Cattle are imported from Truxillo and Omoa. Gold has been found in one of the streams of the Belize.

POPULATION.—The number of the inhabitants is stated in the superintendent's returns for 1845, at 240 white males, 159 white females—total whites, 399; coloured males 6755, coloured females 2655—total coloured, 10,410. Total population, 10,709. This population is chiefly composed of negroes, who were first brought to the country as slaves, but many of them obtained their liberty long ago, and worked at daily wages. There seem to be no aboriginal tribes within the territories of Belize, except some Caribes, who have fled into it as a place of refuge. The white inhabitants are exclusively occupied in commerce, and the negroes in cutting mahogany and dye-woods, and in fishing. A few of them cultivate small patches of ground.

BELIZE, the only town, is built on both sides of the mouth of the river of the same name, and the stream is crossed by a wooden bridge. It consists of a long street running along the sea-shore, from which three or four smaller streets branch off. The houses are constructed of wood, and are raised eight or ten feet from the ground on pillars of mahogany; they are well built, spacious and convenient. In front of the town there is excellent anchorage for vessels of moderate size, and the surface of the sea is rarely agitated by winds, as it is protected by the numerous keys from the heavy swells of the open sea.

Mr. Stephens says, "on approaching the town from the sea, we saw Belize appearing (if there be no sin in comparing it with cities consecrated by time, and venerable associations) like Venice and Alexandria rising out of the water—a range of white houses extended a mile along the shore, terminated at one end by the government-house, and at the other by barracks, and intersected by the river Belize, the bridge across which formed a picturesque object; while the fort on a little island at the mouth of the river, the spire of a Gothic church behind the government-house, and groves of cocoa-nut trees, gave it an appearance of actual beauty. Four ships, three brigs, sundry schooners, bungaloes, canoes and a steam-boat, were riding at anchor in the harbour; alongside the vessels were rafts of mahogany; far out a negro was paddling a log of the same costly timber, and the government *dons* which boarded us when we came to anchor, was made of the trunk of a mahogany tree."

There was no hotel in the place. A mulatto lady afforded board but no bedrooms. An unoccupied house was offered to Mr. Stephens to sleep in: which

was rendered unnecessary by the hospitality of Governor Macdonald, who lodged them hospitably under his roof. The town seemed one almost entirely inhabited by blacks. The bridge, the market-place, the streets, and stores, were thronged with them; and Mr. Stephens "found himself in the capital of a negro republic." He describes them as a fine-looking race, tall, straight, and athletic, and well dressed: the men in white cotton shirts and trousers, with straw hats; the women in white frocks, and short sleeves, and broad red borders, and adorned with large red ear-rings and necklaces. He breakfasted at the house of a merchant, where the latter sat at one side of the table, his wife at the other. Opposite a British officer sat a mulatto, and Mr. Stephens himself, *an American citizen*, "*sat between two coloured gentlemen.*" Colour, he found, was "mere matter of taste, and that the great work of practical amalgamation had been going on quietly for generations."

Belize, it is asserted, owes its origin to a bold Scotch buccaneer, of the name of Wallace, who used to resort for refuge behind the keys and reefs which protect Belize from the ocean. He formed an alliance with the aborigines of the Mosquito shore, and with the English who came down on the coast to cut mahogany; he held the Spaniards in defiance. Central America claims Belize as well as the Mosquito shore. England holds, and will probably continue to possess the first. The aborigines, who have the only good tenure to the soil, have never been dispossessed of the latter. There are schools in which the inhabitants, of all shades of colours, are instructed in Belize.

The government *Pit-pan*, a boat in which Mr. Stephens made an excursion, is the same fashioned vessel, he says, "as those by which the rivers of America were navigated before the arrival of the Spaniards. European ingenuity has not contrived a better, though it has, perhaps, beautified the Indian model. Ours was forty feet long and six feet wide in the centre, running to a point at both ends, and made of the trunk of a mahogany-tree. Ten feet from the stern, and running forward, was a light wooden top, supported by fanciful stanchions, with curtains for protection against sun and rain, it had large cushioned seats and was fitted up as neatly as the gondolas of Venice. It was manned by eight negro soldiers, two on a seat with paddles six feet long, and two stood up behind as steersmen—a few touches of the paddles gave brisk way to the *pit-pan*, and we passed rapidly the whole length of the river. The citizens stopped to gaze, and the idle negroes turned to the bridge to cheer us. Before the cheering of the negroes died away, we were in as perfect a solitude as if we were removed thousands of miles from human habitations. The Belize river, running from sources yet but little known to civilised man, was then in its fulness. On each side was a dense unbroken forest; the banks were overflowed; the trees seemed to grow out of the water, their branches spreading across so as almost to shut out the light of the sun, and reflected in the water as in a mirror. The sources of the river were occupied by the aboriginal owners, wild and free as Cortez had found them."

Mr. Stephens left Belize on his expedition to explore the rivers of Central America in a steamboat, well provided by Colonel Macdonald. The coast, as they proceeded south, assumed an appearance of grandeur and beauty which realised his ideas of tropical regions. There was a dense forest to the water's edge—beyond were lofty mountains, covered to the summits with perpetual green: some detached,—others rising in ranges until enveloped in the clouds.

PUENTA GORDA.—They entered Puente Gorda, a settlement of Caribs, about 150 miles south of Belize. No steamboat had ever entered it before. Cotton, rice, the cohoon, banana, cocoa-nut, pine-apple, orange, lemon, plantain, and other fruits, were growing with such luxuriance, that he actually found their fragrance at first oppressive. A padre, who was on board, performed the ceremonies of "wholesale baptisms and marriages." There were in the settlement about 500 inhabitants—formerly natives of the sea-coast below Truxillo, but having taken part against Morazan, they fled to this place.

At *Puente Gorda*, as being within the limit of British authority, they formed the settlement. They lived apart, however, as an unconquered tribe of Caribs, though they had been, as far as ceremonies were concerned, professors of the Roman Catholic religion. The visit of a padre was, however, a rare occurrence. From this place the steamboat steered for the *Golfo Dulce*; an amphitheatre extends along and back from the coast—through which the narrow river Dulce flows; the banks, before approaching its entrance, are about thirty feet above the water, and are rich and luxuriant. The fertile territory of Belize requires only the application of labour and capital to render it a most productive sugar-growing country,—and many other valuable products, exclusive of mahogany, might be drawn from its soil and its forests. We are informed that *labourers* would be induced to migrate from Yucatan to British Honduras for moderate wages.

During the year 1845, in consequence of the duty on mahogany in England being reduced to a nominal amount, the trade was greatly increased.

The government is administered by a superintendent, an executive council assembly and an assembly, called a public meeting. There is a chief justice, colonial secretary, provost marshal, and other officers.—(For the statistics of the colony, see *British Possessions in America*.)

CHAPTER XLIV.

THE MAHOGANY TREE OF HONDURAS.

MAHOGANY-TREE (*Sivietinia Mahogani*). There are rather more different qualities, than varieties, of this beautiful tree in America and the West Indies. That of Cuba and Hayti, usually called Spanish mahogany, and that of the same kind, now scarce, which grows in Jamaica, is the most beautiful in its shades, colours and variegations. Honduras and Yucatan now supply the larger quan-

tities; and although not so close grained and beautiful as the former, yet furnishes a most useful wood, and it has lately been extensively used for ship-building. It is superior, also, to the other for the tenacity with which glue binds it to other woods, and even to veneers of Cuba or Hayti mahogany,—worms do not destroy it in the water.

We find generally in many accounts written of the operations of bringing mahogany to market the most inaccurate descriptions. The following account condensed from an article written at Belize and published in the Honduras Almanac, has been examined by a gentleman who was a resident, and connected with the business. We, therefore, may consider it accurate.

The mahogany-tree of Honduras is probably the most magnificent and splendid of all trees; the largest oak, usually called the King of the Forest, would dwindle to insignificance in the comparison. The enormous size and height of the trunk; the vast spread of its branches, the space of ground occupied by its roots, are all remarkable.

“It becomes almost impossible to give the more minute circumstances attending the growth of this valuable and much-used tree, as its progress to maturity is scarcely perceptible within the life of man; but as far as our limited observation will allow us to form an opinion, not less than an average period of 200 years can be allowed as the time of its coming to full growth or fit for cutting.

“Various and differing are the conjectures relative to the first use, discovery, and introduction to Britain of this beautiful wood, nor is it within the limits of such a sketch as this to remark upon their accuracy; we therefore reject all accounts that appear speculative, and confine ourselves to such as are authenticated. Its first discovery was, therefore, by the carpenter on board of one of Sir Walter Raleigh’s vessels, when he put into some harbour in the island of Trinidad in the year 1595, who, having occasion to go on shore to cut some pieces of timber, required for work to be done on the ship that he belonged to, brought on board a quantity of this wood, which, on being worked from the raw state, exhibited, to the astonishment of all who saw it, that beautiful natural variety of appearance which no ingenuity of art can equal.

“The first use to which mahogany was applied in England arose from a circumstance purely accidental, and was appropriated to the making of a box for holding candles. Dr. Gibbons, an eminent physician, in the latter end of the seventeenth or beginning of the eighteenth century, had a brother a West India captain, who brought over some planks of this wood as ballast, but was not aware of its value. As the doctor was then building a house in King-street, Covent-garden, his brother thought they might be of service to him; but the carpenters finding the wood too hard for their tools, they were laid aside as useless. Soon after Mrs. Gibbons wanting a candle-box, the doctor called on his cabinet-maker, to make him one of some wood that lay in his garden. Wallaston, the cabinet-maker, on cutting it up also complained that it was too hard; the doctor said that he must get stronger tools. The candle-box was, however, made, and highly approved of, inasmuch that the doctor then insisted on having a bureau made of the same wood, which was accordingly done, when the fine colour, beautiful polish, &c., were so pleasing that it became an object of curiosity, and he invited all his friends to come to see it,—among them was the Duchess of Buckingham. Her grace begged some of the same wood from Dr. Gibbons, and employed Wallaston to make her a bureau also, on which the fame of mahogany became general. Thus, from a circumstance in itself so trivial has emanated a most extensive branch of British commerce; and as the cutting and preparing of the mahogany is a matter which has been hitherto passed unnoticed by all historians, we trust that a brief narrative may be here acceptable to our readers.”—*Honduras Almanac*.

The season for cutting the mahogany usually commences about the month of August. The gangs of labourers employed consist of from twenty to fifty each.

"They have a conductor, who is styled the captain. Each gang has also one person belonging to it, termed the huntsman—he is generally selected from the most intelligent of his fellows, and his chief occupation is to search the woods, or, as it is called in this country, the bush, to find labour for the whole. Accordingly, about the beginning of August, the huntsman is despatched on his important mission, and if his owner be employed on his own ground, that is seldom a work of much delay or difficulty. He cuts his way through the thickest of the woods to some elevated situation, and climbs the tallest trees he finds, from which he minutely surveys the surrounding country. At this season the leaves of the mahogany-tree are invariably of a yellow reddish hue, and an eye accustomed to this kind of exercise can, at a great distance discern the places where the wood is most abundant. He now descends, and to such places his steps are directed, and, without compass, or other guide than what observation has imprinted on his recollection, he never fails to reach the exact spot to which he aims. On some occasions no ordinary stratagem is necessary to be resorted to by the huntsman to prevent others from availing themselves of the advantage of his discoveries; for if his steps be traced by those who may be engaged in the same pursuit, which is a very common thing, all his ingenuity must be exerted to beguile them from the true scent. In this, however, he is not always successful, being followed by those who are entirely aware of all the arts he may use, and whose eyes are so quick that the lightest turn of a leaf or the faintest impression of the foot, is unerringly perceived—even the dried leaves which may be strewn upon the ground often help to conduct to the secret spot,—and it consequently happens that persons so engaged must frequently undergo the disappointment of finding an advantage they had promised to themselves seized on by others. The hidden treasure being, however, discovered, the next operation is the felling of a sufficient number of trees to employ the gang during the season. The tree is commonly cut about ten or twelve feet from the ground, a stage being erected for the axe-man employed in levelling it; this, to an observer, would appear a labour of much danger, but an accident rarely happens to the people engaged in it. The trunk of the tree, from the dimensions of the wood it furnishes, is deemed the most valuable; but for purposes of an ornamental kind, the limbs, or branches, are generally preferred, the grain of them being much closer and the veins more rich and variegated."

A sufficient number of trees being felled to occupy the gang during the season, they commence opening roads to the nearest river, which operation amounts to two-thirds of the labour and expense of bringing the mahogany to a place of shipment. Each mahogany station forms in itself a small village, on the bank of a river,—the choice of situation being always regulated by the proximity of such river to the mahogany intended to be cut.

In the construction and arrangement of the habitations much taste is often displayed, and it is curious to remark the different modes peculiar to the several nations or tribes of Africa, contrasted with the improvement introduced by European experience in the construction of the houses,—among which the proprietor's residence, with storehouses, cattle-sheds, &c., are conspicuous—those of the different labourers are usually of more humble appearance, but all built of the same wood, which the site affords in abundance.

"We have frequently seen houses of the kind completed in a single day, and with no other implement than the axe; consequently every workman is capable of performing the labour required to build his own dwelling. After completing this establishment, a main road is opened from it, in as near a direction as possible to the centre of the body of trees so felled, into which branch or wing roads are afterwards introduced. The ground

through which the roads are to run being yet a mass of dense forest, both of high trees and underwood, they commence by clearing away the latter description with cutlasses, which, although in appearance a slender instrument, yet from the dexterity with which it is used, answers the purpose admirably. This labour is usually performed by task-work, of 100 yards each man per day, which expert workmen will complete in six hours. The underwood being removed, the larger trees are then cut down by the axe, as even with the ground as possible, the task being also at this work 100 yards per day to each labourer, although this is more difficult and laborious, from the number of hard woods growing here, which, on failure of the axe, are removed by the application of fire. The trunks of these trees, although many of them valuable for different purposes, such as *bullet-tree*, *ironwood*, *redwood*, *sapodilla*, &c., are thrown away as useless, unless they happen to be adjacent to some creek or small river which may intersect the road; in that case they are applied to the constructing of bridges across the same, which are frequently of considerable size, and require great labour to make them of sufficient strength to bear such immense loads as are brought over them."

The distance of road to be cut each season depends on the situation of the mahogany-trees. If they are much dispersed, miles of road, and many bridges, are made to a single tree, that may yield but one log. The roads, cleared of all brushwood, require hoes, pickaxes, and sledge-hammers, to level down the hillocks and break the rocks, and loosen the stumps which would impede the wheeled trucks on which the logs are carried. The roads being formed generally by the month of December; the *cross-cutting*, as it is called, commences; that is dividing crosswise, by means of saws, each tree into logs, according to their length. Some trees are but long enough for one log, others will admit of four or five being cut from the same trunk. The rule for dividing the trees into logs, is to equalise the loads the oxen have to draw. This, however, does not altogether obviate irregularity of weight, and extra oxen are kept in readiness to add to the usual number, according to the weight of the log. Owing to the very great difference of diameter and length of the mahogany-trees, the logs taken from one tree may not measure more than 300 cubic feet, while those from the next may be as many thousands; the largest log ever cut in Honduras was in length seventeen feet; breadth, fifty-seven inches; depth, sixty-four inches; measuring 428 cubic feet, or 10.28th tons, of forty cubic feet, and 5168 superficial feet, of one inch thick; weighing about fifteen tons.

"The sawing being completed, the logs are separated one from the other, and placed in whatever position will admit of the largest square being formed, according to the shape which the end of each log presents, and is then reduced, by means of the axe, from the round or natural form, into the square; although some of the smaller logs are brought out in the round, yet, with the larger description, the making them square is essential, not only to lessen their weight, but also to prevent their rolling on the truck or carriage."

In the month of March, all the preparation before described is, or ought to be, completed—this is the dry season, or time for drawing the logs from the place of their growth to the river. This can only be carried on in the months of April and May, the ground for all the rest of the year being too soft for heavily-laden trucks to pass over it without sinking. The rains usually terminate in February, but the ground is so saturated with water that the roads are seldom fit for use till the 1st of April.

"The mahogany cutter's harvest may be at this time said to commence, as the result of his season's work depends upon a continuance of the dry weather, for a single shower of rain would materially injure his roads. The number of trucks worked is proportioned to the strength of the gang, and the distance generally from six to ten miles. We will, for example, take a gang of forty men, capable of working six trucks, each of which requires seven pair of oxen and two drivers, sixteen to cut food for the cattle, and twelve to load or put the logs on the carriages; which latter usually take up a temporary residence somewhere near the main body of the wood, it being too far to go and return each day to the river-side, or chief establishment. From the intense heat of the sun, the cattle would be unable to work during its influence; consequently, they are obliged to use the night-time in lieu of the day, the sultry effects of which it becomes requisite to avoid. The loaders, as before mentioned, being now at their station in the forest, the trucks set off from the barquadier about six o'clock in the evening, and arrive at their different places of loading about eleven or twelve o'clock at night. The loaders, being at this time asleep, are warned of the approach of the trucks by the cracking of the whips carried by the cattle-drivers, which are heard at a considerable distance; they arise and commence placing the logs upon the trucks, which is done by means of a temporary platform laid from the edge of the truck to a sufficient distance upon the ground, so as to make an inclined plane, upon which the log is gradually pushed up from each end alternately. Having completed their work of loading all the trucks, which may be done in three hours, they again retire to rest till about nine o'clock next morning. The drivers now set out on their return, but their progress is considerably retarded by the lading; and although well provided with torchlight, they are frequently impeded by small stumps that remain in the road, and which would be easily avoided in daylight; they, however, are in general all out at the river side by eleven o'clock next morning, when, after throwing the logs into the river—having previously marked them on each end with the owner's initials—the cattle are fed,—the drivers breakfast and retire to rest until about sunset, when they feed the cattle a second time, and yoke in again.

"Nothing can present a more extraordinary appearance than this process of trucking, or drawing down the mahogany to the river. The six trucks will occupy an extent of road of a quarter of a mile; the great number of oxen—the drivers half-naked (clothes being inconvenient from the heat of the weather and clouds of dust) and each bearing a torchlight—the wildness of the forest scenery—the rattling of chains—the sound of the whip echoing through the woods—then all this activity and exertion so ill corresponding with the silent hour of midnight makes it wear more the appearance of some theatrical exhibition than what it really is, the pursuit of industry which has fallen to the lot of the Honduras woodcutter.

"About the end of May the periodical rains again commence. The torrents of water discharged from the clouds are so great as to render the roads impassable in the course of a few hours, when all trucking ceases—the cattle are turned into the pasture—and the trucks, gear, and tools, &c., are housed.

"The rain now pours down incessantly till about the middle of June, when the rivers swell to an immense height; the logs then float down a distance of 200 miles, being followed by the gang in pitpans (a kind of flat-bottomed canoe) to disengage them from the branches of the overhanging trees, until they are stopped by a boom placed in some situation convenient to the mouth of the river. Each gang then separates its own cutting, by the marks on the ends of the logs, and forms them into large rafts, in which state they are brought down to the wharfs of the proprietors, where they are taken out of the water and undergo a second process of the axe to make the surface smooth; the ends, which frequently get split and rent, by being dashed against rocks in the river by the force of the current are also sawed off, when they are ready for shipping.

"The average expense of mahogany cutting is usually estimated at 100*l.* Honduras currency, or about 70*l.* sterling, each labourer per annum, independent of the capital sunk in the purchase of the works, cattle, trucks, gear, craft, tools, &c." (See account of the mahogany and Honduras trade, under the head of British Possessions in America.)

The LOGWOOD-TREE (*Haemaloxylon Capechianum*, Lin.)—This is also a

magnificent tree, but far inferior to the mahogany-tree; yet it is a valuable tree in commerce, and the early history of resorting to Campeachy and Honduras to cut it, by adventurers from Jamaica, and by others who were little superior to pirates, is remarkable for daring intrepidity. It is said to thrive best in a wet clayey soil. The wood is so heavy as to sink in water. It is hard, very compact, and, although it takes a fine polish, is chiefly valuable on account of its colouring matter. In his work on Permanent Colours, Bancroft remarks:

“Logwood seems to have been first brought to England soon after the accession of Queen Elizabeth; but the various and beautiful colours dyed from it proved so fugacious, that a general outcry against its use was soon raised; and an act of parliament was passed in the twenty-third year of her reign, which prohibited its use as a dye under severe penalties, and not only authorised but directed the *burning* of it, in whatever hands it might be found within the realm; and though this wood was afterwards sometimes clandestinely used (under the feigned name of blackwood), it continued subject to this prohibition for nearly 100 years, or until the passing of the act 13 and 14 Charles II.; the preamble of which declares, that the ingenious industry of modern times hath taught the dyers of England the art of fixing colours made of logwood, *alias* blackwood, so as that, by experience, they are found as lasting as the colours made with *any other sort of dyeing wood whatever*; and on this ground it repeals so much of the statute of Elizabeth as related to logwood, and gives permission to import and use it for dyeing. Probably the solicitude of the dyers to obtain this permission, induced them to pretend that their industry had done much more than it really had, in fixing the colours of logwood; most of which, even at this time, are notoriously deficient in regard to their durability.”—(See Trade of Honduras, under the head of *British Possessions*.)

CHAPTER XLV.

THE MOSQUITO TERRITORY.

HONDURAS, with the exception of British Honduras, is situated to the south of the Gulf of Dolce and of the Bay of Honduras. The Mosquito territory extending along from its eastern boundary to the sea. Although part of Spanish Honduras has been long resorted to by the English, we really know little of this country at the present time.

According to Juarras, Honduras and the Mosquito territories together, are 399 miles long, and about 150 wide, area 48,500 square miles. He says,

“The climate of this country is good. The air, excepting on the eastern shore and near the morasses, being pure and wholesome. The soil in most parts is exceeding fertile, abundantly producing corn, vegetables, and fruits. They have a threefold crop of maize in the year, and the vines produce grapes twice in the same period. The pastures are excellent, and the country furnishes all kinds of provisions: but for want of cultivation and settlements, the greater part of it is in a state of nature. It has many good and serviceable small rivers, and is well watered. It has several mountains in its extent, in which are gold and silver mines, and the face of the country is agreeably diversified into valleys, plains, and eminences, overspread in most parts with thick forests. Honey, wool, cotton, wax, mahogany, and logwood, with other dyeing drugs, are its chief products; the latter forming an immense part of its exports, and from which its chief importance is derived.”

Spanish Honduras has detached itself from the other republics of Central America, and hostilities have been maintained almost without interruption between this wild country and the state of Guatemala—the latter being under the sway of a young uneducated Indian of the name of Carera. The sketches by Mr. Roberts, of Central America (published in 1827), are more explicit with regard to the Atlantic coast of Honduras and of the Mosquito shore, than any descriptions we have since been able to procure.

The MOSQUITO TERRITORY has never been subjugated, nor occupied by Spain, and all that Juarras, in his work on Guatemala, says, is scarcely more than alluding to the Mosquito country under the names laid down in his map.

“Between the provinces of Nicaragua and Comayagua, lie those of Taguzgalpa and Tolotalpa, inhabited by unconverted Indians of various nations, differing in language, manners, and customs, and in a state of warfare with each other. They are but obscurely known by the name of Xicaques, Moscos, and Sambos. The English, who had a small fort and a few huts on the banks of the river Tinto, used to trade with these Indians, but have been obliged to abandon the post. These two provinces extend along the coast on the Atlantic, from the river Aguan to that of St. Juan, which space takes in the three prominent points, Capes Camaron, Gracios a Dios, and Puente Gorda.”

Nothing can be more imperfect than this description, by an author who puts himself forth as the geographer and historian of his native country.

According to the boundaries laid down in 1777

“The Mosquito Shore, in America, extends from the northern branch of the Desaguaders (evidently the San Juan), in 10 deg. 21 min. to Cape Gracios a Dios, in 15 deg. north latitude, and from Cape Gracios a Dios, in 82 deg. 40 min. to Cape Castile, or Cape Honduras, in 86 deg. west longitude from Greenwich.”*

This boundary is far more limited than that claimed by the Mosquito kings.

After the English were compelled to leave this territory in 1787, in consequence of the articles quoted from the treaty of 1783. We find the following remarks among the representations made to the government on the case of those settlers.

“In every society of men, from the most rude and simple associations, up to the most perfect and refined state of civilisation, there is a natural public interest; which, by being attended to, secures and promotes its felicity; but by being neglected, produces misery and distress.

* Mr. Roberts, in his interesting sketches of the Mosquito Shore, says,—“Returning (in 1818) from the coast of San Blas, we passed Porto Bello, and proceeded to Chiriqui Lagoon, which, although far to the southward, is considered part of the Mosquito Shore, under the jurisdiction of the Mosquito King, who annually sends his admiral to collect tribute from the natives. Costa Rica extends to Puente Gorda, which is a short distance to the northward of the Rico San Juan, and may be considered the boundary of the real and nominal Spanish possessions on that part of the coast. At Puente Gorda, the Mosquito Shore Proper may be said to commence; and we have met with the small independent tribe of Indians called Ránias. From thence to Cape Gracios a Dios, where the Mosquito king principally resides, the coast lies nearly north and south, a distance of about 220 miles. From Cape Gracios a Dios, nearly north-west, and by west to the river Polock, the distance is about 100 miles. From Little Roman River (within a few miles of Cape Honduras), it stretches to the west about ninety miles, forming a sea-board or line of coast of about 410 miles in extent, upon which the Spaniards have never been able to form any effective settlement.”—p. 54.

"This natural public interest may be more distinctly perceived and more universally attended to, in the first small and rude associations of men, than in extensive and civilized nations; where improvement and art have divided men into various classes and ranks, which give rise to various pursuits, counteracting each other, and often opposed to the general interest of the whole.

"The Mosquito Indians fall under the first of these descriptions; insomuch, that their natural public and private interest is, and uniformly has been, one and the same. It consists in the unrestrained freedom of all the natural enjoyments of life. They range the woods, paddle on the wave, hunt, and fish, as inclination or necessity directs; and as extreme fatigue affords them the sweets of repose, so the enjoyment of repose, stimulates to labour, activity, and enterprise. A most salubrious climate blesses them with every production, by sea and land; and the pure gratification of natural unimpaired appetites, gives them, perhaps, a superior degree of pleasure and of happiness, to that which is enjoyed by the enlightened nations of Europe, who hold them in contempt.

"Such was the situation of this innocent but high-spirited people, when the Spanish invasions took place in America; as well as when the English adventurers first became acquainted with them, in the beginning of the last century. Their love of liberty, added to their natural bravery, impelled them to maintain, in sovereign independency, the possession of their mountains, valleys, woods, lakes, and rivers; against the superior art, arms, and even cruelties of Spain. One common interest united them with their new friends, the English, as having one and the same common enemy (the Spaniard), who aimed at engrossing the whole possession of the new world, in exclusion of all other nations. The view of the Indians, in this political connexion, was protection; on our part, an impregnable barrier presented itself in that portion of the world against the power of Spain, as well as the means of forming important commercial settlements in one of the finest countries on the globe."

Spain has certainly never conquered the aboriginal occupiers of this country, and the inhabitants of this coast are, at this day, perfectly independent. The following sketches upon the authority of the records of the Board of Trade and Plantations, will illustrate the British connexion with a territory, whose prince and people continue to look up to England for protection.

Some time after the conquest of Jamaica by the expedition sent forth by Oliver Cromwell, in 1656, the Mosquito king, with the concurrence of his chiefs and people, placed themselves under the protection of Charles the Second; and the governor of Jamaica, in the name of his sovereign, accepted this union, and promised them the royal protection. They continued faithful to the *pact*, and whenever the British crown declared war against Spain, they readily acted as allies, with both vigour and success against the common enemy.* It was also remark-

* Among the documents drawn up for the government relative to the expulsion of the British settlers from the Mosquito shore in 1786, we find the following statement respecting the country:—

"First: the uniformly steady and uninterrupted living evidence of the Mosquito Indian nation, who have invariably transmitted from father to son the strongest and clearest ideas of their independency of Spain and its subjects, accompanied with sentiments and conduct of the most implacable hatred and revenge towards the whole Spanish race, in retaliation of the enormous cruelties universally attending their first conquest and domination in America. This chain of living testimony, unbroken by the remembrance of any event which either reduced them as a people under the power of Spain, or constrained them to receive in the remotest degree Spanish laws or Spanish magistrates amongst them, remains as full and fair a proof of their real and perfect independency, as any which the laborious written records of any nation more enlightened could produce.

"Second: the history, exploits, and conduct of that very extraordinary class of men, known

able that whenever peace was restored between England and Spain, the natives of the Mosquito nation permitted the Spaniards to come into their country with confidence and security, to trade with the subjects of Great Britain. A long time, however, had elapsed before any regular British settlement was established on the Mosquito Shore; but many individual adventurers passed, from time to time, from Jamaica to that coast, and traded with the natives for tortoiseshell, sarsaparilla, and deer-skins; and, *under their protection, bartered British commodities for Spanish gold.* This transient commerce on the Mosquito coast, and the logwood-trade carried on by the British settlement in the province of Yucatan, on the western parts of the Bay of Honduras, Spain thought proper so unjustly to interrupt, by capturing the ships of British subjects in that part of the world, as to cause the war of 1739, which continued to the peace of 1748. Prior to this period, the governor of Jamaica had appointed justices of peace on the Mosquito Shore, with authority (besides the discharge of the ordinary duties belonging to their functions as justices), to decide commercial questions of contracts and of debts. During the war, the importance of that country was so fully understood, that the British government determined to hold it under the immediate sovereignty of Great Britain. The king appointed a superintendent to preside over the settlements on the Mosquito coast, and to cultivate and preserve the friendship of the aboriginal inhabitants; and also to promote the interests and extend the commerce of his majesty's subjects residing there. Captain Robert Hodgson, the first superintendent, proceeded, in 1749, with the command of one hundred men, drafted from the troops at Jamaica, and took possession of the principal station at Black River, on the Mosquito coast, where he erected a fort, mounted it with cannon, hoisted the royal flag, and kept up a garrison; thus making a formal publication to all the world, and to the crown of Spain, that the independent country of the Mosquito coast was under the direct sovereignty and protection of Great Britain.*

and distinguished by the appellation of the buccaneers of America, corroborate and confirm, in the strongest manner, this living testimony of the Indian independency throughout their territories of the Mosquito Shore. For those buccaneers attacked the Spaniards in every part of their conquests in Mexico, Peru, and Chili; but the Mosquito Shore they not only never attacked, but associated the Mosquito Indians as fellow adventurers in their Spanish expeditions into the South Seas; and in their repeated retreats from thence to the North Sea, over the Isthmus, they directed their course towards Wank's River, which brought them into the territories of the Mosquito Shore, and afforded them always the warmest protection of the Mosquito Indians, as being Spain's most implacable enemies."

* The following minutes of the Council of State at Jamaica, reported to the lieutenant-governor, were by him transmitted to the Board of Trade and Plantations in 1773:—

"The committee of the board to whom your honour was pleased to refer sundry papers, letters, and examinations respecting the Mosquito Shore, and the disturbances at present subsisting among the British settlers thereon, have taken the same into their most serious and dispassionate deliberation, and now attend your honour with their report.

"We find the number of inhabitants in 1770 to have been between 200 and 300 whites, about 200 persons of mixed blood, and about 900 slaves. The Mosquito Indians, so justly remarkable for their fixed hereditary hatred of the Spaniards and attachment to us, were formerly very nume-

From this time, during the peace, and until the conclusion of the war of 1756, the Mosquito Shore continued to be a military, federal, protected province of Great Britain. In the treaty of peace concluded in 1763, the 17th Article had no connexion whatever with the Mosquito Shore; but the ministers of the day seem to have but little understood the history and importance of that country. In the negotiation they were imposed upon by the court of Spain, and gave orders, in 1764, for demolishing the fort at Black River, and withdrawing the garrison to Jamaica. They were soon afterwards convinced of the impolicy of this decision, and approved of the conduct of Superintendent Otway, in refusing the Spaniards admission into the country. Future administrations continued to support the settlements, and to maintain the sovereignty of the crown over the Mosquito territory in such a manner as to silence the pretensions of Spain to any dominion over it.

From the first establishment of a superintendent on the coast, and of a garrison at Black River, the colony increased in population and prosperity, notwithstanding the various secret attempts of the Spaniards to oppress the Indians and the settlements during his administration. The settlers perceived, from the royal instructions given to the superintendents, that although the British government

rous, but they were much reduced some years ago by the small-pox: their present number is from 7000 to 10,000.

"An administration of justice by magistrates appointed by the governor of Jamaica and courts of quarter-session, have been settled there for many years, and a commission of superintendency, amenable to the control and examination of the governor and council of Jamaica, has been granted by the crown.

"The native Indians of this country have never been conquered by, nor ever submitted to the Spanish government. The Spaniards never had any settlement amongst them. During the course of 150 years, they have maintained a strict and uninterrupted alliance with the subjects of Great Britain. They made a free and formal cession of the dominion of their country to his Majesty's predecessors, acknowledging the King of Great Britain for their sovereign long before the American treaty concluded at Madrid in 1670; and, consequently, our right was declared by the seventh article of that treaty. This cession of the Indians to the British crown has been frequently and very formally repeated, particularly by the Mosquito king to the Duke of Albemarle, when governor of Jamaica; and this accumulation of British right was not impaired by the last treaty of peace. These appear to us to be truths equally certain and notorious; and after this it is difficult to guess what can be said to invalidate his majesty's rights and acknowledged title to the sovereignty of the Mosquito Shore.

"The climate, as we are well informed, is milder than in any of the West India islands, and the air more salubrious; the lands are everywhere well watered, and everywhere fertile. The soil, indeed, is said to be rich in an uncommon degree. The necessaries, and even the luxuries of life, present themselves on all sides: the rivers, lagoons, and sea, abound with excellent fish; and the coasts afford the greatest number of the finest turtle, both for food and for the shell, of any country of equal extent in the known world. The cotton-tree, the cacao, or the chocolate-nut, and veneloes, flourish spontaneously all over the country; indigo, too, is a native, and appears to be of the same sort with that of the neighbouring province of Guatemala, which is accounted the best of any. The sugar-cane arrives here to as great perfection, as in any of the islands; and of mahogany and sarsaparilla, the quantity exported annually is so great, as to render the settlement already an object of no small importance to the commerce of Great Britain; no less than 800,000 superficial feet of the former of these articles, and of the latter 200,000 lbs., exclusive of 10,000 lbs. of tortoiseshell, having been shipped to England in 1769. The banks of the rivers and lagoons are equally well adapted to the growth of logwood, as any part of the neighbouring province of Honduras; and we have reason to think, from the nature of this plant, that in the course of twenty or thirty years, a sufficient quantity may be raised in this country to supply all Europe."

declined to erect, immediately, the country into a British province, it was considered very desirous to encourage and promote its commerce, and they naturally concluded that, the sooner they were able to bring its trade into a conspicuous point of view, the sooner they would render it expedient for his majesty's ministers to establish a provincial government. With this view, the settlers and traders began to purchase lands from the Indians, to plant sugar-canes, and cultivate cotton, cacao, and other articles. Eight of the principal settlers purchased a tract of land, said to contain a gold mine, lying on the banks of *Polloy River*, and extending in length about seventy miles, and thirty miles in breadth, on each side of it, known by the name of *Alberapoyer*. Their motive, in acquiring this large tract of country, was to associate purchasers with themselves from Great Britain, to work the mine, improve the estate, and raise the importance of the colony. To accomplish which, they gave full powers to one of their number, Lieutenant-Colonel Lawrie, the last superintendent of the Mosquito Shore, who was then going to London on his private affairs. This purchase was made in May and June, 1771. Colonel Lawrie, on his arrival in London, and previous to his enlarging the number of the proprietors of the estate, brought the subject fully before Lord Hillsborough, his majesty's secretary of state, and presented a memorial to him, on the month of November following; requesting to know what support might be expected from government, on carrying the plan into execution. His lordship approved of the plan, and assured him protection. This assurance of public support enabled him to accomplish his object in April, 1772, by a deed of demise and declaration of trust, for dividing the estate into two-and-twenty shares; and the new proprietors, to exclude every idea of fraud or imposition in acquiring so large a property, obliged the original proprietors to obtain a renewal and confirmation of their first grant, by the most approved mode of lease and release; and to enter the deeds in the records of the settlement at Black River, all which was accomplished in the course of that year. Such was the notoriety of this purchase, and such the approbation of government, in carrying it into execution.

In January, 1775, an embassy arrived in London, consisting of young George, son of the Mosquito King, Isaac his brother, Captain Smee and Captain Richards, two Mosquito chiefs.* This embassy, amongst other objects of utility, had in

* It is the custom of the Mosquito Indians to assume British names. Thus, the Mosquito king called himself George, after his majesty. His son, also, was named Young George, and was sent to England to be educated. Isaac, the Indian king's brother, likewise assumed the title of Duke of York; and the names Isaac, Smee, and Richards, were assumed from particular British subjects whom they esteemed. This custom is continued at the present day. Jeremy, a king of the Mosquito country, visited Jamaica in the reign of Charles II. He had previously executed a deed, placing himself under the protection and homage of England. He then proceeded to England, and was graciously received by the king. The successor of Jeremy was called Edward, who with his successors, George I. and George II. all visited Jamaica, and went through the ceremony of homage and claiming protection. This continued until 1787.

view the rectifying of a flagrant crime, which had been then often practised, of ships carrying off free Indians, belonging to the back Indian settlements, and selling them for slaves in North America. Government attended to their complaints. A new system of administration was formed by Lord Dartmouth, in August, which Governor Sir Basil Keith put in execution in December, 1775. This system consisted of a Council of Government, of which the superintendent was president; of a Court of Common Pleas; and of a Bench of Justices of Peace. Appeals were to lay from the Justices of Peace to the Court of Common Pleas; from the Court of Common Pleas to the Council of Government; and from the Council of Government to the Governor and Council of Jamaica. Superintendent Hodgson was ordered home to London, and Sir Basil Keith appointed John Ferguson, Esq. to act as superintendent, *pro tempore*.

In the month of May, 1776, Mr. Hodgson was dismissed, and Colonel Lawrie appointed to succeed him. Superintendent Lawrie set out immediately for Jamaica, received Sir Basil Keith's commission, as commander-in-chief of his Majesty's subjects on the Mosquito Shore, and proceeded immediately to the principal settlement at Black River.* He found the Indians and settlers greatly distressed by the Spanish capture of the *Morning Star*, while lying at anchor off Black River in April preceding; and by the recent desertions of their negroes, encouraged by the conduct of the Spaniards towards the Indians and the settlement.

In 1777, some of the principal settlers sent to England an assortment of sugars, rum, indigo, bark, sarsaparilla, tortoise-shell, &c., in two vessels, the *Neptune* and the *Hope*; the first in October, 1777, the other about January, 1778. The *sugars in both*,

Young George, the Prince, and the other three chiefs, having finished their embassy, took their passage on board the *Morning Star*, Captain Millar, bound from London to the Mosquito Shore, about the month of January, 1776. Two Spanish guarda costas were there fitted out, to intercept her. Fortunately for the Prince and his companions, the vessel put in at Cape Gracias a Dios, where they were landed; but on the *Morning Star* proceeding to her destination at Black River, the two cruisers fell in with and captured her when lying at anchor, in the roadstead.

* Governor Sir Basil Keith, of Jamaica, agreeably to a plan transmitted to him, from his Majesty's government, by the Earl of Dartmouth, issued a series of instructions on the 29th of December following, consisting of twenty-one articles, for the Reformation and Improvement of the Civil Police and Government of the Settlement established on the Mosquito Shore, which were carried into full execution in the month of January, 1776: and that in the Royal Instructions accompanying his Majesty's appointment of Superintendent Lawrie, on the 17th of May, 1776, the superintendent is not only directed (as all former superintendents had been), "To promote the prosperity of the settlement, to improve the commercial advantages which might be derived from it:" but he is further made acquainted with his Majesty's pleasure, "That he should forthwith transmit to Lord George Germaine (as secretary of state), through the hands of the Governor of Jamaica, an accurate account of the settlement intrusted to his care; specifying its extent, the number of its inhabitants, the nature and amount of its then trade, and what further commercial advantages it was capable of affording."

Under this national unlimited encouragement of trade and commerce, the Alberpoyer estate, the sugar, coffee, cacao, and cotton plantations, as well as the provision grounds the woodlands, and every other species of landed property, forming the claims, had been and were openly, freely, and honestly purchased of the Indians, by his Majesty's subjects; and remained protected and secured to them, at the conclusion of the treaty of peace, in September, 1783.—*Case of the British Subjects expelled from the Mosquito Shore.*

and the sugars only, were refused admission at the custom-house ; which obliged them to go to a foreign market. The objection to admitting the sugars, was a clause in the 6th of George III., c. 52, which declares "*that sugars imported from British Plantations on the continent of America, shall be deemed French sugars,*" and pay duties accordingly.*

The navigation on the coast had become insecure by the piratical capture of the *Morning Star*. In July and August following, the sudden desertion of a body of negroes, and the appearance of disaffection amongst those who remained, made it necessary to proclaim martial law, which diverted the attention of the settlers from all kinds of business. In the Spring of 1777, a conspiracy between the Spanish Governor of Panama, an Indian governor, and an English trader, was carried on against the colony. The correspondence was detected and transmitted by the superintendent to the Secretary of State at London. Two Spanish guarda costas seized a vessel belonging to Jamaica at Pearl Quay Lagoon ; they made prize of another belonging to Captain John Campbell, at Bluefields ; burnt there a third on the stocks ; and having landed on the corn islands, they carried away a very considerable quantity of goods. In addition to these distresses, the Indians and the settlers were kept in constant alarm this year and a great part of the next, by advices, from time to time, of a Spanish armament against the Coast, and of their raising fortifications about the entrance of the river San Juan. Those circumstances were all communicated by the superintendent to the Governor of Jamaica, and the Secretary of State at London ; and at the special instance of the Council of Government on the Shore, the superintendent requested to be furnished with a blockhouse, arms, ammunition, a few of the cannon formerly taken from the Shore, and a free company of a hundred, or even fifty men ; not as soldiers, but volunteers, for the preservation of their negroes, and for defending the roadstead. In return to this application, Lord George Germaine transmitted a despatch to the Governor of Jamaica, on the 4th of June, 1777, severely rebuking the superintendent for having made the request ; "as being in direct contradiction to the seventeenth article of the Treaty of Paris." Yet had he not made it, the superintendent must have been guilty of a most criminal neglect ; and acted in direct contradiction to his lordship's official instructions, even as his

* On the question being referred to the Lords of Trade, they gave a cautious opinion, as follows :—

"Tuesday, April 27th, 1779.

"Agreeable to the resolution of the 20th instant, their lordships having again resumed the consideration of the memorial of the inhabitants of the Mosquito Shore, and having also read and considered a second memorial of the said inhabitants upon the like subject, referred by Sir Grey Cooper, under the direction of the Lords of the Treasury ; and likewise a letter from Mr. Jackson, stating his opinion upon the Act mentioned in the said memorials, they were of opinion that, though the Mosquito Shore is indisputably part of the great American continent, it cannot be considered as one, or any part of one of the British Colonies or Plantations thereupon, in the sense or spirit of the Act of the sixth of his present Majesty, but superintended dependently on the Island of Jamaica ; and therefore, that the produce of the Shore should not be made subject to the restrictions of the clause in question."

lordship stated them in the very same dispatch ; which directed him, “ to apply himself to establish good order among the inhabitants, to promote the prosperity of the settlements, to improve the commercial advantages which may be derived from them, and to cultivate a strict union and friendship with the Indians in those parts.”

The conduct of the superintendent was never after called in question. In 1779, one Terry, a man of great daring, formerly a British subject, but then a renegade in the pay of Spain, attempted, in a Spanish vessel of war, filled with presents, and occupying the southern parts of the coast, to induce the Indian chiefs to depose George the King, and place his cousin, Prince Eugene, in his stead ; who was to acknowledge the protecting sovereignty of Spain, and drive the British colonists out of the country.

The Governor of Jamaica, early in the Spring of 1780, ordered an attack to be made from Jamaica upon Lake Nicaragua, and directed that the superintendent, with his people from the Mosquito Shore, should form part of this expedition. Being consequently left in a defenceless condition, the settlement at Black River was put to flight, in the month of April following, by a body of Spaniards from Truxillo ; who, after destroying a number of sugar and provision plantations, returned to their former station ; whilst the Negroes, left to themselves, seized on the town of Black River Bank, and declared they would be free. To suppress the revolt, Major Richard Hoare, Captain Farrall, and Captain O'Brian, who had been expelled from Yucatan, and then resided on the Island of Roattan, assembling a body of men under their command, consisting of the people of their own settlement, and a collection of fugitive settlers from the shore. With this armament, they proceeded to Black River, where they opened a conference with the insurgent negroes, and granted freedom to a few of the ringleaders, the rest submitted to pardon. Soon after this, Superintendent Lawrie returned to Black River with the remains of the settlers, from the abortive expedition against Lake Nicaragua, much reduced and in a precarious state of health.

The Mosquito Shore was so far neglected by government that only twenty-one regular soldiers were at Black River Bank on the 5th of March, 1782 ; when it was invested by sea, by three schooners, two sloops, two gallies, and *pettyaugers*. The Spanish forces advanced on the 15th, from the southward, by Black River, with 1350 foot, 100 horse, and 350 Indian pioneers ; on the 29th, from the westward, with 1000 men ; and on the 30th a line-of-battle ship and a frigate came to anchor off Fort Dalling, and under a heavy fire landed 500 men. To oppose this force, the superintendent had twenty-one soldiers, the settlers, their negroes, and some hundreds of Indians all ill-supplied with arms, without ammunition, and without provisions. He skirmished with the enemy, and maintained his post until the 31st of March. On the 30th the guns of Fort Dalling

were spiked, and a retreat effected to the Bank, where Captain Douglas of the militia, who commanded it, was captured by the Spaniards. Agreeably to the Governor of Jamaica's orders, when in the face of a much superior enemy, a council of war was held on the 31st, in pursuance of which a general retreat was finally effected, attended with great suffering from scarcity of food, want of clothing, and from sickness, to Cape Gracios à Dios.

The settlers having thus been driven from Black River, assembled at Cape Gracios à Dios, expecting assistance from Jamaica; and the victory over the French obtained by Admiral Rodney, in the month of April, enabled the governor and admiral at Jamaica, to turn their attention to the Shore. A small squadron, with a detachment of 130 of the Loyal American Rangers, furnished with arms, stores, provisions, and presents for the Indians, was fitted out and sailed from Port Royal on the 7th, and arrived at the Cape on the 17th of August, to assist the settlers and the natives to expel the Spaniards from Black River Bank. Here they found Superintendent Lawrie at the head of 800 settlers (Indians and negroes), determined, although in weak health, to proceed in four days to the attack of Black River. The reinforcement gave the greatest animation to the expedition, until they learned that Robert Hodgson, their former superintendent, who had been much disliked, was appointed to command them, as a provincial colonel. But the settlers and the Indians detesting him, and dreading the exercise of his authority, unanimously refused to be commanded by him. The settlers and Indians, in concurrence with the superintendent, conferred the command on Captain Despard, a provincial colonel, though a junior officer. Major Lawrie, the superintendent and commander-in-chief, willingly accompanied the expedition as a volunteer. The armament proceeded from the Cape on the 26th of August; landed at Plantain River on the 28th, where they were joined by a number of free men and negroes, in that neighbourhood; and by Captain John Campbell, who with about 150 volunteer negroes, had attacked and carried Fort Dalling from a like number of the enemy. On the 29th the whole body, consisting of about 1000 men (of which there were only 80 regular troops), advanced to the Bluff, at the mouth of Black River; and on the 30th they encamped on the banks of the lagoon, opposite the town. Here the enemy opened a conference with Colonel Despard, which ended in a capitulation; by which the town surrendered on the 31st of August, with 715 regulars, and their officers, as prisoners of war. All the western boundaries of the Shore were soon after recovered, after having been five months in possession of the Spaniards.

After the most deliberate discussion of the subject, it was determined by the British Government to retain the Mosquito Shore under British protection and sovereignty. With this object, in view, the sixth article of the definitive treaty with Spain, concluded in September 1783, restricts the evacuation of his Majesty's

subjects to be only "from any other parts (than those expressly given to them by the said article) whether on the Spanish continent, or in any of the islands whatsoever, dependent on the Spanish* continent."

From September, 1785, until July 1786, the respective claims of England and Spain to the Mosquito territories were discussed, and on the 12th of July, 1786, it was announced that the territory was to be delivered up to the Crown of Spain. This abandonment of the country and its inhabitants was considered at the time by the British people a most profligate surrender.

It was with the most painful reluctance, and only in obedience to positive orders, that the British settlers slowly and discontentedly left their plantations. Many of the Creoles and people of colour, as well as some of the Europeans, preferred remaining at all hazards. For a long period they, or their descendants, resided unmolested, and comparatively comfortable, in their old possessions, particularly at Bluefields, Pearl Kay Lagoon, and other places on the coast, which were by them, and their Indian friends, considered *English* settlements.

The actual number of persons, exclusive of the aborigines, under the British jurisdiction in the year 1757, according to the account of their superintendent, Colonel Hodgson, was about 1100 souls; and in the year 1770, Mr. Edwards estimated the number at 1400. The greater part of them were settled at Black River, Cape River, and Brancmans:—the former place, where the British had erected a small fort, was the only one of the deserted settlements which the Spaniards dared even attempt to take into their possession; but they were immediately driven from it by the Indian general, Robinson. The remainder of the British, at Cape Gracios à Dios, Sandy Bay, Pearl Kay Lagoon, the Corn Islands, Bluefields, Punta Gordo, Brewers Lagoon, Plantain River, Miztisoë Creek, and other parts of the coast, as far southward as Chiriqui Lagoon, were never molested. They owned twelve merchant vessels, several of them in the European trade, the others constantly trading to Jamaica and the United States; and their exports of mahogany, sarsaparilla, tortoise-shell and mules; together with specie, indigo, cocoa, hides, and tallow got in barter with the Spaniards, were very considerable, and daily increasing.

Of the great national advantages of this country there is now no reason to doubt. The ill-judged plans of a remarkably brave and gallant man, General Sir Gregor Mac Gregor, and the imprudent administration of those who seconded his attempts, gave rise to gross misrepresentations of the Mosquito country. There is sufficient proof that several parts of it are decidedly more salubrious

* The dispute between the two crowns, immediately previous to adjusting the treaty of September 1783, was, whether the term *Spanish*, or the term *American* continent, should be used in this article; and it was agreed in favour of the first. Now the Mosquito Shore was no part of the Spanish continent; but a part of the American continent possessed by the Mosquito Indians, as independently of the crown of Spain, as any of the other parts of America, possessed by other independent states and powers. Therefore the evacuation comprehended in this article, had no relation whatever to that country.

than any one of our settlements in the West Indies. It is well known, that if men are located in low marshy ground, in the neighbourhood of stagnant water, the consequences are injurious to them in every country, but more especially in a hot climate:—but in dry situations similar to the Valiente and Bluefields settlements, where the waters quickly run off, Europeans, generally speaking, enjoy an almost uninterrupted state of health, and live to a good old age. In such situations, the general mass of European cultivators could, with safety, perform more than double the work done by the Valientes, or any other tribe of Indians. Many of the dry savannahs, and fine ridges, are equally healthy; but it is in the interior, on the banks of the rivers, that agriculturists should form settlements; and many thousands could find such situations in the hilly country behind the Kharibbee settlements, without putting any of the native residents to inconvenience. According to Mr. Roberts—

“The mosquitoes, sandflies, and other insects; the poisonous reptiles, and wild beasts, of which so much is said in England, are, as regards the situations alluded to, mere bugbears to frighten children; the former are only troublesome on the low sandy beaches and swamps, some settlements being entirely clear of them; and the latter seldom come near the habitations of men, or do any harm. It has been asserted, and I am more inclined to confirm than deny it, that nearly the whole line of coast from Cape Honduras to the River San Juan, is free from those violent hurricanes which sometimes rage with such destructive fury in the West India Islands; and it has also been affirmed, that the same tract of country is not subject to those dreadful earthquakes which have so often shaken, and at one time or other, almost entirely destroyed the Spanish American towns towards the Pacific Ocean; spreading death and dismay amongst the wretched inhabitants.”

The Mosquito country affords almost inexhaustible supplies of cedar, mahogany, santa maria wood, rosewood, and many other exceedingly valuable timbers may be obtained on the coast, and on the banks of all the rivers in the interior:—dyewoods, gums, drugs, and medicinal plants of various descriptions, are plentifully dispersed all over the country. On the savannahs are reared considerable numbers of cattle; and innumerable herds could be pastured on the plains close to the shore, as well as in the interior. The soil is well adapted to the cultivation of sugar, coffee, cotton, tobacco, indigo, and all the other productions of a tropical climate; rice and Indian corn might be produced, to supply the whole of our West India possessions.—Such are the resources of a country which has been shamefully neglected though not altogether abandoned by England.

If we examine all the circumstances, bearing upon the claims of right to possession and occupancy; and if we consider that Spain has lost all dominion on the continent of America, we are reasonably led to the conclusion that the Mosquito Territory is still an independent country, and one over which Spain never had the least control or occupation. It is evident that none of the anarchical states of Central America have any right by occupation, or by recognition, to the Mosquito country. If we contend that the country is independent, a question arises as to how far its king or rulers, and more than all its inhabitants, are under

the protection or sovereignty of England. The English from Jamaica, and all who speak the English language, who have frequented it since 1787, have found the same favour among the people as formerly; the Spanish races continue to be, as formerly, detested and held as enemies. Mr. Roberts's accounts of the coast, as well as all the more recent information we have received, are perfectly conclusive as to the accuracy of these facts. The misfortune has been that the Mosquito kings themselves, and the Zamboes, the people who possessed most authority, have manifested but little wisdom or justice in the country.

When Mr. Roberts visited Cape Gracias à Dios, the Mosquito king was a young man, who had been semi-educated at Jamaica. The father of this king, old King George, was of the mixed, or negro and Indian breed; and said to be of a cruel, barbarous, and vindictive character. He enslaved great numbers of the Blanco, Woolwa, and Cookra tribes; and, like all the Mosquito chiefs, had a great number of wives, or concubines, whom he often flogged so severely that some of them died in consequence. The murder of one of these women, under circumstances of remarkable barbarity, created a riot, during which the king was fired upon, and killed, by his own people. He left two sons, George Frederick, who succeeded him, and a half-brother, Robert, both then very young. A trader from the Bay of Honduras, contrived to get these children into his vessel, and persuaded the chiefs that they might derive great benefits by having their future king educated "English fashion," so that he might understand something of the laws, manners, and customs of their friends the English. They were allowed to depart; and the chiefs forming a sort of regency, the three principal ones agreed to retain the country for the eldest son, dividing it, in the mean time, into three governments. The first, from Roman River to Patook, including the tribes of Kharibeas, Poyers, Mosquito men, and some negroes, formerly attached to the British settlements, was confided to a chief named *General Robinson*.

The second, from Caratasca, or Croata, to Sandy Bay and Duckwarra, which included all the Mosquito men proper, or mixed breed of *Zamboes and Indians* was left under the rule of a chief, the brother of the late king, under the title of *Admiral*.

The third, from Brancmans to Great River (Rio Grande) was under the charge of *Don Carlos*, and styled "*the Governor*." This division included the tribes of Tongulas, Towcas, Woolwas, Cookras, &c. These chiefs appointed head-men within their respective districts, subordinate to their authority. The small settlements of Zamboes, at Pearl Kay Lagoon and Bluefields, were allowed to choose their own head-men.

The princes were sent from Honduras to Jamaica: where the Duke of Manchester is said to have shown some attention to Prince George. After the routine of a very imperfect education, he was sent to Belize, where the principal Mosquito chiefs were instructed to meet him, and the ceremony of his coronation was

performed. The young chief was escorted to church by the British superintendent, by the regular troops, militia, and principal people of the settlement. The rector put the crown (a present from the British to one of his ancestors) on his head; and he was formally invested with the sword, rake, and spurs; a royal salute was fired, and he was styled *King of the Mosquito Shore and Nation*.

Medals and dresses were presented to the chiefs, who, with the young king, were sent to the Mosquito coast in a British sloop of war. They were accidentally landed at General Robinson's residence, between Black River and Brewers Lagoon; and the king commenced his reign by grossly insulting and quarrelling with this general, his most powerful chief. At Cape Gracias à Dios the king was received by all the members of his family, who principally resided at an extensive pine savannah called the Ridge, about forty miles from the Cape, at a short distance from the bank of the great Cape River.

The king was naturally of a generous disposition, and not destitute of ability; and it was regretted that he had not received an European, rather than an extremely loose West Indian education: by the former he would have had a fair chance of acquiring correct habits, and some idea of the importance of order and good government; whereas, by the latter, he became possessed of very little really useful information. It amounted to little more than engrafting, as it were, the bad qualities of the European and Creole, upon the vicious propensities of the Zambo, and the capricious disposition of the Indian, by which his life was embittered, and his ultimate destruction caused. He was, it is said, assassinated in 1824 Colonel George Woodbine, of San Andres, at the request of the chiefs, sat as chairman in the investigation which took place. Some of those concerned in the murder were put to death. Robert, his half-brother, succeeded him, and had a brief reign. The next king, George Frederick, descended from a more ancient branch of the family, was succeeded by his brother, the late King Robert Charles Frederick, and with the rule, or rather misrule, of this sovereign are associated some of the most profligate circumstances in the Mosquito Territory. The late king was notoriously addicted to drunkenness. Several of the British subjects settled at different parts of the coast acquired a complete influence over his sottish majesty. There was, in fact, a *family compact* in the Mosquito Territory, differing, it is true, in its morality, and in the nature of its bonds, but as firmly united as that which existed in Canada. In the Mosquito Shore plurality of mistresses was considered no disgrace. It was no uncommon circumstance for a British subject to have one or more of these native women at different parts of the coast. They acquired an influence through them, both over the inhabitants, and over a king of intemperate habits; and before the death of Robert Charles Frederick, grants were obtained from him by certain British subjects of about two-thirds of the whole territory. These grants, authenticated copies of which we have examined, were drawn up in the usual technical style of

phraseology, and conferred on the grantees little less than absolute sovereignty over the extensive regions which they comprised. They were extorted from the king when in a state of mind incapable of judging right from wrong. They are signed, George Frederick, *his mark*; the mark being a sort of scratch. The king not knowing how to write.

As a British agent has usually been residing on the Mosquito Territory, in order to maintain the long existing connexion with England, these grants appear to have been made during the absence, and without the knowledge of such agent.

On Mr. Walker, who had been previously colonial secretary at Belize, being sent as British agent to the Mosquito coast in 1844, these grants became one of the objects of his solicitude, and he soon discovered that they were obtained irregularly, and could not be maintained. An attempt was made to sell one of the largest grants, as the foundation of a large colony, to a Prussian company, under the patronage of the prince royal, but the tenures being considered utterly worthless, and disavowed by the British government as the guardian of the young king, the projected colony was at once abandoned.

George Frederick left as heirs two sons, George Augustus Frederick, and William Henry Clarence, and a sister. They and the dowager queen Joanna, were left, we believe, under the will of the late queen, to the care of Colonel Macdonald, late her majesty's superintendent at Belize. The two sons have been educated with some care. Clarence is now (1846) in Europe with Colonel Macdonald; and it was considered that he was intellectually, and in regard to health, better adapted to succeed to the crown than Prince George.

During the minority of the latter the country was under the administration of sectional governors or superintendents. It having been decided that Prince George should be crowned as usual at Beloze, the necessary preparations were made. The regalia, consisting of a silver gilt crown, a sword, and sceptre, all of moderate value, and given formerly to one of the kings by the British government, were brought from the usual place of security, the dwelling of the chief at Vankes River.

On the 17th of April the British sloop of war *Hyacinth* arrived at Bluefields for the purpose of carrying the young king, George Augustus Frederick, to Belize, to be crowned according to ancient usage, which was performed by the commissary of the Bishop of Jamaica on the 7th of May, 1845, in St. John's Church, Belize, in the presence of the superintendent, Colonel Fancourt, Mr. Walker, British agent at Bluefields, and several chiefs. The young king was treated with great attention by Colonel Fancourt. It appears, from the last information which we have obtained, that considerable progress in the way of improvement has been made during the last four years, but we must admit that the manners and customs of the inhabitants still require thorough regeneration. In order to bring forward the productive elements of the country a great addition to the population and

capital are necessary. With these elements the Mosquito Territory would become a wealthy and important country. This will appear evident from the following descriptive sketches.

The British government has appointed the resident agent to reside at Bluefields River. Without directly interfering in the affairs of the government, he offers to king and chiefs counsel and advice, and maintains the alliance and protection of England.

The Governor of Jamaica has always, and up to the present time, been charged with the superintendence of all communications with the Mosquito Shore.

CHAPTER XLVI.

DESCRIPTIVE SKETCHES OF THE MOSQUITO SHORE.

THE territory of the Mosquito country, as hitherto claimed by the kings, extends from Cape Honduras south to *King Buppa*, or landing-place, near the Escuda de Veragua, and comprises the sea-coast of the following provinces, viz., PROVINCE OF HONDURAS, including Cape Honduras, Roman River, Black River, Potook River, Cape Gracias à Dios, and Wava River.

PROVINCE OF NICARAGUA, including Bluefields River, San Juan River, and Vankes River.

COSTA RICA, including Salt River, &c.

VERAGUA, including Bocca de Toro, Bocca de Chiriqui, Escuda de Veragua.

The government of Grenada claims the Bocca de Torro, Bocca de Chiriqui, and the Escuda de Veragua. Central America also claims a part, but the Spaniards never appear to have occupied them.

It is stated (August, 1845), that the New Grenadian islands of Providence and San Andreas are almost entirely peopled by persons of English extraction, and by negroes speaking the English language, and that a great many of the latter are slaves, many of whom will probably escape to the Mosquito Shore if they can.

From the Rio San Juan to Puerta Gorda, a distance of about thirty-four miles, the coasts form a bay, into which falls the Corn River (Rio Trigo), Indian River, and some other streams, and Gundolore Bay, which has anchorage in four or five fathoms water. From the neighbourhood of San Juan to Bluefields River, the country has always been occupied by the Rama Indians, said now to be much diminished in number. They are subject to the Mosquito king. Bluefields is a magnificent river, navigable, it is said, for more than eighty miles through a fertile country, and passing through mountain ridges a short distance from the sea. Its entrance may be readily known by a remarkably high barren islet, about four miles off its entrance. The bay is shallow, but there is good an-

chorage under Point Gorda, about four miles further to the northward, a place which may be distinguished by its having several small islands and keys in its vicinity.

From San Juan River to Puerta Gorda, the forests abound in vanilla of the finest quality. This vine climbs and twines up to the top of the highest trees. The leaves bear some resemblance to those of the vine; the flowers are white with some red and yellow; the pods grow in bunches not unlike the plantain. The pods are at first green, then grow yellow, and finally brown. Care must be taken not to allow the pods to remain upon the stalks too long before they are pulled, as, in that case, they exude a black fragrant balsam, which carries off both the perfume and delicate flavour for which they alone are valued. Vanilla is also found on most parts of the Mosquito Shore, and in the neighbourhood of Bocca del Toro and Chiriqui Lagoons. It requires heat, moisture, and shade, to bring it to perfection, and imparts, in the opinion of those who use it, a most delicious flavour to coffee, chocolate, &c., forming an important article of commerce, especially among the Spaniards. In the neighbourhood of the Lagoons and the above places, a very fragrant bean, resembling, if not in reality, the true Tonquin bean, is also found.

The Rama Indians have always paid an annual tax to the Mosquito king in tortoise-shell, canoes, hammocks, and cotton lines. They are considered mild and inoffensive, and have had little intercourse with other Indians; they are expert in the management of canoes and boats, and will effect a landing where the best European boats would meet certain destruction: their canoes and dories are much broader, shallower, much more buoyant, and better adapted for landing in a heavy surf, or for crossing the bars of rivers, than those generally used on the coast. The Ramas, when engaged by the English settlers, have always proved very faithful servants. The Indians assert, that the Bluefields River flows through a country rather level, of great fertility, and abounding in mahogany, locust, santa maria, and many other trees.

The small keys and islets, which lay off this part of the coast, and that of Bluefields, are frequented by the Indians during the season, for catching hawks-bill turtle.

BLUEFIELDS, which is now the residence of the king, and the capital, is said to derive its name from a celebrated English Captain of Buccaneers in the seventeenth century.

Mr. Roberts, who was intimately acquainted with the coasts, says,

“For trading vessels of an easy draught of water, the upper lagoon is perhaps superior to any other harbour on the Mosquito Shore, being completely sheltered from all winds. There are two entrances; that to the southward, through Hone Sound, is very difficult, and dangerous even for small craft; the bar being generally covered with breakers, and having only four to five feet water;—but the principal and only one for ships, is to the northward, close to the Bluff, a high rocky eminence, capable of being easily fortified, completely commanding the entrance, upon the bar of which, extending across to Deer Island, there is never less, but sometimes more, than fifteen feet water. After passing this bar, there is from four to six fathoms water. Close to the shore it continues

deep, but it gradually shallows to three, and three and a half fathoms, which is the general depth throughout the upper and lower lagoons. There are many banks, and shoals, about the entrances, but none of them dangerously situated for shipping; many of them are dry at low water, and abundance of fine oysters can then easily be procured. The Lower Lagoon is full of small kays, or islets, and is from fifteen to twenty miles in length, having sufficient depth of water for vessels of considerable burden, but the channels are intricate, and only known to the settlers at Bluefields. The Upper Lagoon, which is a continuation of the Lower, is not more than a mile broad at its entrance, but its width further up, increases to five or six miles; and, into it, the great river of Nueva Segovia of the Spaniards, and several smaller ones, empty themselves.

"The lands bordering on all these rivers are extremely rich and fertile, capable of growing cotton, cocoa, coffee, sugar, and all the different kinds of produce raised in the British West Indies. The forests abound in cedar of the largest description, mahogany, and many other valuable woods. The pine Savannahs, bordering on Bluefields, and Pearl Kay Lagoons can furnish an inexhaustible supply of the very finest pitch-pine timber, some of it fit for the largest masts."

The British superintendent who resided at this place during the latter period of the time when the English had settlements on the Mosquito Shore, had extensive mahogany works on the banks of the principal river, and a very considerable trade was carried on with the Spaniards and Creoles in the interior. This was the state of things when the unaccountable policy of the British Government compelled the settlers to abandon that country in the year 1786.

Several of the slaves and people who were established in the interior, refused to leave the place. These people and their descendants, called Zamboes, were settled at the southernmost extremity of the harbour, about nine miles from its principal entrance, and they have increased considerably in numbers after that time.

When visited by Mr. Roberts, he says,

"They lived without fear of molestation from the Indians, none of whom reside within many miles of them; and, although it is not acknowledged as such by the British government, it may be truly considered a British settlement. It is principally under the influence of two intelligent young men, who claim affinity to the late superintendent."

The river of Bluefields rises in the country possessed by the Spanish race within fifty or sixty miles of the South Sea, and flows a course of several hundred miles. The Cookra and Woolwa tribes of Indians, who are settled on its banks, at a considerable distance in the interior, are described as a quiet peaceable race, and always on good terms with the Ramas, and with the people at Bluefields Lagoons. They have been often enslaved, or murdered, by the Indians resident about Great River.

Bluefields, with its excellent harbour, protected by a rocky, bluff point, capable of being made almost impregnable, is in an excellent situation for opening a communication across the country to the Lakes of Nicaragua, and possesses many other advantages as a maritime and commercial station. It would become, under a wise government, a place of considerable importance. It is annually frequented by British, United States, and some Columbian trading vessels, bringing variously assorted merchandise in exchange for tortoise-shells, vanilla, sarsaparilla, &c.

The British agent alluding in 1845 to the best situations for agriculture says—

“The most advantageous points for Europeans to settle, are said to be Bluefields, Pearl Kay Lagoon, and St. John’s. Bluefields for its salubrity and luxuriant soil; Pearl Kay for its pasturage; and St. John’s for its harbour and prospects of trade. Bluefields, however, may be considered the best, as the title to land is there perfectly clear. The late king, in 1841, gave to its inhabitants a grant of 22,000 acres of land for their own use, and towards the endowment of a church, school, and hospital. It is composed of high lands, forming a large accumulation of hills, the bases of nearly all being irrigated by numerous creeks of delicious fresh water, and the principal of which, Gun-boat Creek, is capable at all times of the year of turning mills. It abounds with various kinds of excellent timber. It would be highly desirable, and in fact essential, that persons settling should be persons acquainted with tropical agriculture, and who should make it subserve to such, viz.: the raising of coffee, sugar, and cotton. Not one inch of ground is unfit for cultivation.”

He recommends that only small allotments ought to be granted to settlers, except to persons who could bring free African labourers, or Hill Coolies, with them. Mr. Walker, in the latter part of 1845, was engaged in completing a survey of the town lands, and assisting the magistrate in allocating the different lots in accordance with the late king’s grant and wishes. There is no minister of religion at Bluefields. There is a large court-house and an hospital. An English school-master has been lately established there.

PEARL KAY LAGOON is about thirty miles from Bluefields, a headland named False Bluefields, is the only high land on the coast until Brancman’s Bluff, or Monte Gordo; it consists of three or four moderately high hills, of red, stiff clay, rising almost perpendicularly from the beach. They extend along the shore for nearly two miles, with a gentle slope at each end, terminating in a savannah. About half a mile to the southward of the Bluff there is good anchorage; at one time there was a small British settlement near it.

Mr. Roberts says,—

“The entrance to Pearl Kay Lagoon is little more than a quarter of a mile in width, and is at the bottom or south end of the bay, over a bar, on which there is about ten feet water. The safest anchorage for vessels is under the north side, off which there are several small *islands*, kays, and reefs, on which pearl oysters are said to have been found. Moreover, these places are called the *Pearl* Kays, but, for what reason, I never could ascertain, as there is certainly no pearl oysters, or oysters of any kind that I could discover, upon them, or on the reefs by which they are surrounded; although in the Lagoon there are abundance of good oysters, on banks, many of which are dry at low water. These oysters are in bunches of about eight or ten in each bunch; they are rather larger than the mangrove oyster, but of a different kind from those in the Bay of Panama, and other places producing pearls.

“There are several islands in Pearl Kay Lagoon, some of them from one to three miles in circumference, and, in some instances, they are used for raising ground provisions. Several rivers and considerable streams fall into it, the principal of which is Wawashaan, about twenty-five miles to the northward of the entrance. On the banks of the Wawashaan, about eleven miles from the place where it discharges itself, a French subject named Ellis established a very neat plantation. When the island of San Andres, off this coast, was given up to the Spaniards, he was governor there, and he, with several followers and their families, retired to the present settlement, where they considered themselves perfectly safe from the Spaniards, and having obtained a grant of land from one of the late kings of the Mosquito Shore, they proceeded to cultivate it. He succeeded in establishing a plantation of coffee, cotton, and sugar-cane. His attention was first directed to the cultivation of coffee and cotton; but finding that

rum would be a more profitable article, he, about eight years ago, commenced its distillation; and, when I left the coast, he was in the habit of retailing twenty or thirty puncheons annually, at an immense profit. A Mr. Goffe, whose settlement was at Jupiter's Head, or Old Bank, a few miles from Wawashaan, and near the Lagoon, turned his attention more to the raising of stock, and cultivation of ground provisions. He had a great number of bullocks, hogs, goats, and poultry of all kinds; with abundance of yams, cassava, plantains, and Indian corn, which he sells to the traders, settlers, and occasional visitors. Mr. Ellis may, however, be said to be the only planter on the whole coast, according to the West Indian acceptance of the term; but there are many situations which, in point of soil, and other local advantages, are far preferable to the one he occupies."

There are a few settlements of Mosquito Indians, and Zamboes, on the borders of the Lagoon; but the principal settlement is at a place about six miles to the southward of the entrance, and being composed of people similar to those at Bluefields, it was also considered an English settlement. The people were principally Creoles, Mulattoes, and Zamboes from Jamaica, San Andres, and the Corn Islands; many of them married Indian women, and live comfortably. Their place of residence, consisting of thirty or forty houses, was called English Bank, and faces the shore of the Lagoon. The population, said to be above 150 or 200, lived in neat, compact houses of one story high, the sides for the most part made of clay, beaten down hard into a framework of lath and hardwood posts, and roofed with a durable kind of palm leaf. Mr. Roberts says that the Jamaica traders established stores for the sale of goods among them, and they were supplied from the United States; the agents in charge of these stores resided constantly at English Bank, and were visited by different tribes of Indians, and by Mosquito men from all parts of the coast, bringing tortoise-shell, gum copal, caoutchouc, &c.; skins, paddles, canoes, and various articles to barter for duck, check, cutlass-blades, and other goods adapted for the Indian trade. The inhabitants employed themselves in catching turtle during the season, and in raising provisions, and in hunting and fishing during the remainder of the year. They maintained a friendly correspondence with the unmixed Indians; were, in general, fair and honourable in their dealings with them and with each other, and were very hospitable to Europeans or other strangers who come amongst them.

The same authority tells us,—

"I never knew an instance of a marriage being celebrated among them, according to the prescribed forms of the English, or of any other church; these engagements are mere tacit agreements, which are sometimes, although rarely, broken by mutual consent. The children here, and at Bluefields, are in general baptised by the captains of trading vessels from Jamaica, who, on their annual return to the coast, perform this ceremony with any thing but reverence on all who have been born during their absence; and many of them are indebted to these men for more than baptism. In proof of this, I could enumerate more than a dozen of acknowledged children of only two of these captains, who seem to have adopted, without scruple, the Indian idea of polygamy in its fullest extent. By this licentious and immoral conduct they have, however, so identified themselves with the natives, and with some of the principal people on the coast, as to obtain a sort of monopoly in the sale of goods, which it would be difficult for any stranger, not possessed of an intimate knowledge of the Indian character, to shake; they have

also so insinuated themselves into the good graces of the leading men, that their arrival on the coast is hailed with joy by all classes, as the season of festivity, revelry, christening, and licentiousness. Notwithstanding that they live in this free manner, without fixed laws or religious restraint, they, in absence of the traders, maintain an order and regularity that would not lose by comparison with any of the small provincial towns in England."

During the time previous to 1786 that the British were fixed on this part of the Mosquito Shore, under the superintendency of Colonel Hodgson, many persons became settlers there. The climate of the country around Pearl Kay Lagoon is salubrious, and, on the whole, with common care and industry, the necessaries, and many of the luxuries of life may be easily procured. The country and Lagoon abounds in all kinds of game and fish peculiar to the country and coast. The Mosquito men, Ramas, and other Indians, hire themselves to the settlers at Bluefields and at Pearl Kay Lagoon, as hunters and fishermen. The Ramas or other pure Indians are always preferred to the mixed breeds. They were well known to the old buccaneers, who had always some of them attached to their expeditions, even as far as the South Sea.

PEARL KAY LAGOON is of considerable magnitude, one part of it reaching to within eight miles of Great River, or Rio Grande ; its greatest winding length from north-east to south-west cannot be far short of sixty miles, or its breadth from sixteen to twenty. The Indians, in bad weather, instead of keeping along the sea-coast, enter Pearl Kay Lagoon by hauling their canoes over the narrow neck of land between it and Bluefields Lagoon, and, at the upper end of it, they have another *haulover* of about two hundred yards into the ocean.

On many parts of the banks of the Lagoon indigo is said to grow spontaneously, but the richest land is generally to be found on the high ground, and on the banks of rivers more remote from the coast.

RIO GRANDE enters the ocean about thirty miles to the northward of the entrance to Pearl Kay Lagoon. Being exposed to north-east winds, its mouth is extremely dangerous, and there is not more than four or five feet water over its bar. It is said to be navigable for boats nearly two hundred miles. There are several small islands inside the bar, but none off its entrance. The settlements of Indians on its banks are subject to the Mosquito king, to whom they pay tribute, but like every other tribe of *unmixed Indians*, have only submitted to the authority of the Zamboes from motives of safety and of greater detestation of the Spaniards.

Their headmen have always considerable influence over them, and the other Indians adjoining on the Prinzipulko and Rio Grande settlements.

One headman is named by the Mosquito kings "governor," another "admiral," and the headman at Prinzipulko "captain." Mr. Roberts visited the Governor Drummer's settlement, situated about eight miles from the mouth of the river, on one of its branches, close to an extensive pine savannah.

"This house," he says, "is a large building divided into three apartments ; close to

it stood a shed for cooking and other domestic purposes. It is situated on a rising ground, at a short distance from the river, and surrounded by twenty or thirty other houses of smaller dimensions. I found it tolerably well-furnished with tables, benches stools, crockery ware, glass, &c. ; and every thing in and about it wore the appearance of a comparatively well-regulated and comfortable abode. Its owner received me with the greatest cordiality, and sending to make inquiries among his people, soon gave me to understand that I could procure six such canoes as I wanted here and at a little distance ; and also that he could procure me a quantity of tortoise-shell—in short, to use his own words, that I should be treated ‘true English gentleman fashion.’

“For all this kindness I was in some measure indebted to a few gallons of rum which I had brought, and it was intimated that I had better rest from the fatigues of the voyage, and leave business until next day. In the meantime, the goods and rum were carefully removed from the dory to an apartment in the house ; and in a short time a repast was served consisting of fish, flesh, fowl, and fruit, which, if properly cooked, would not have disgraced the table of an alderman. Toward sunset, innumerable flights of macaws and parrots were seen coming from all quarters, to roost in the tall pine-trees near the houses, and the continued noise made at this time and at their departure in the morning gave no bad idea of an English rookery : they are fond of harbouring near the Indians, who never molest them. Several horses were grazing in the savannah, but no black cattle—these are kept, as I afterwards learnt, in the interior, at the provision grounds.

“On my return to the house, I found the principal people of the settlement waiting for me ; and as I knew they had adopted the ideas of the Mosquito men, who judge of a trader by his liberality in supplying them with their favourite beverage, I requested Drummer to use my rum bottles as if they were his own ; and, in consequence, all were soon in a state of intoxication.

“Early in the morning I called up Nelson, one of Drummer’s sons, to join me in a ride through part of the savannah. He soon caught a couple of horses which seemed accustomed to be mounted, but for a bridle we had only a small piece of rope ; and a thick mat made of dried plantain leaves, without the appendage of stirrups, served for a saddle.”

This people, though unmixed, had all English names. The neighbouring savannah was intersected by numerous paths, mostly of a fine sandy nature, in various directions leading to the hunting and provision grounds of the inhabitants under Governor Drummer and the admiral, each of whom had several wives at their different plantations.

The soil of the savannah is sandy or gravelly, in parts without vegetation. All the pine savannahs in the neighbourhood of the sea, on the Mosquito coast, are described as sandy, and, comparatively speaking, barren ; while the soil of the interior savannahs is fertile. This is similar to the pine savannahs of North Carolina. The inhabitants of the coast are consequently obliged to have their provision grounds and plantain walks on the banks of rivers or streams several miles up from the sea. Cassava thrives here on a sandy soil, and is grown close to the coast settlements. The country of the Valientes, Tiribeas, and Ramas on the South coast is described as decidedly superior to that occupied near the sea by the Mosquito men.

Mr. Roberts observed the tracks of several deer on the sandy paths ; and the sand in some places shone like filings of steel. The governor assured him that in one part of this extensive savannah, about thirty miles from his settlement, natural iron could be procured in considerable quantity, but he saw no specimen of the metal.

"The governor," he says, "had provided an excellent breakfast, but complained that last night's debauch had 'spoiled his head,' a common expression of the Mosquito men, who, unlike the Indians to the southward, have no objection to 'spoil their heads' whenever they can by any means procure rum."

He observes that the whole of the Indians of these settlements, instigated by the Mosquito chiefs, used formerly to invade the tribes of Cookras, Woolwas, and Toacas, bordering on the Spanish territory, for the purpose of capturing and selling them for slaves to the settlers, and chief men on different parts of the Mosquito Shore. These tribes, in consequence, have withdrawn themselves far into the interior, and hold very little intercourse with the Indians on the coast. The Cookras, much diminished in numbers, are now seldom seen, the Wool was have also retreated back to the upper branches of the rivers Nuevo Segovia, Rio Grande, and other places, at a distance from the *Coast* Indians and Mosquito men. Drummer, who was the governor of Rio Grande during Mr. Roberts' visit, "had, in his early years, been an intolerable scourge to these inland tribes and to the Woolwas in particular, some hundreds of whom had been, from first to last, captured by him and his parties and sold as slaves. His method was to steal upon, and, if possible, in the absence of the males, surprise the temporary settlements or residences of the small roving parties moving about the heads of the rivers, seize the women and children, and effect his retreat, if possible, without fighting. In some instances, these kidnappers have gone as far back as the settlements of the Spaniards and Spanish Creoles, whose wives and children they have not hesitated to carry off and appropriate to their own use."

"I repeat," says Mr. Roberts, "that it is more to the diabolical instigation of the Mosquito chiefs, than any cruelty of disposition on the part of the pure Indians, that these inhuman outrages are committed against those who would otherwise be considered in every sense of the word their brethren; but, as the influence of the Mosquito chiefs is daily decreasing, these cruel proceedings will gradually cease."

The Prinzapulko River, about thirty miles distant from Rio Grande, is a majestic stream, but has, like Rio Grande, a dangerous bar, with only about four feet water over it. The Indians, settled on its left bank, about seven miles up from the sea, and on the banks of a small lake about ten miles distant from this station, are the same race of people as those at Great River; but, unlike them, the chiefs here, have found it their interest to encourage and protect, rather than oppress, the Woolwas and tribes of the interior; and they carry on some trade in buying canoes, dories, and pitpans, which these tribes bring down the river roughly formed or blocked out, and they are afterwards neatly finished, and decorated for sale.

Mr. Roberts remarks that "the great size of these canoes formed out of the trunk of a single tree of cedar, or mahogany, is a proof of the immense timber which grows in their country; and of the valuable trade that might be carried on with them, were they protected from the Mosquito men, and encouraged to visit the coast. I have known some of these canoes above thirty-five feet long, about five feet deep, and nearly six feet broad. I found that those made of mahogany are best for working to windward under a press of sail; but that those of cedar are more buoyant, and do not sink even when full of water and partly loaded."

During his visit the headman at Prinzapulko had great influence with the Indians of the interior. Brown, an intelligent native, had also been very instrumental in encouraging the country Indians to bring their rough dories and other articles to Prinzapulko for sale. In exchange for their rough canoes and such other articles as they brought for sale, they received old axes, adzes, beads, looking-glasses, and some other articles.

Brown, the Indian above-mentioned, accompanied Mr. Roberts on several trading voyages, and he always found him faithful and trustworthy, in situations of the most trying nature.

Having bought from Tarra, the headman, three dories, and a small quantity of tortoise-shell, he returned to Great River (Rio Grande), and from thence, after having agreed at both places to become the purchaser of their next season's collection of tortoise-shell, he removed with the vessels he had purchased, and a young Woolwa, whom he had redeemed, and who appeared pleased at getting out of the hands of his captors, to Pearl Kay Lagoon.

At Prinzapulko he met Admiral Earnee, one of the three principal chiefs of the Mosquito Shore, who had been as far to the southward as Bocca del Toro collecting the king's tribute. He was a complete black, or negro, without the least appearance of Indian blood; but, when sober, a sensible, shrewd, and intelligent man, a descendant from some of the Zambo negroes, who were formerly wrecked on this coast. Preparations had been made for the arrival of this negro chief, and about twenty-five people, his attendants, who were amply supplied with provisions, and feasted at the king's house. The tribute was also in readiness, the principal part in tortoise-shell; a single *back* of shell being demanded from every canoe employed in turtleing during the season. The same value in dories, hammocks, or coarse cotton-cloth of the country being exacted from those canoes employed in any other manner.

The principal settlements of the Zamboes and their immediate allies, formed a chain of hamlets, at certain distances, from one end of the Mosquito Shore *proper*, to the other; and, in each of these, a house called the *King's*, was erected by the joint labour of the community, and appropriated for the reception of the king, or his officers, when they visit the settlement. In it, also, the headman of the settlement, or one of the three principal chiefs who govern the coast, decided controversies, and frame laws and regulations, which were afterwards to be sanctioned by the king before being carried into effect. Some of these houses are described as of considerable size, and built with care and solidity.

On sailing along the coast, advantage is taken of the lagoons and land breeze, which generally begins to blow off the shore about sunset, and continues until about ten o'clock next morning. Mr. Roberts, on leaving Prinzapulko in company with the admiral, says:—

“Finding a dangerous sea running on the bar, Earnee, myself, and some of his

attendants, landed at the mouth of the river, and proceeded along the coast towards Tongula Lagoon, leaving the rest of the people in the dories, to endeavour to make their passage by sea. We crossed the river leading to the lagoon, and continued our journey until the sea breeze should begin to blow down the coast; and we remained at one of the king's houses, erected for the convenience of travellers, at a small distance from the sea-bank, about half-way between Prinzapulko and Wava Lagoon, near a *haulover*, of about five hundred yards in length, into the Tongula Lagoon, where the canoes joined us. There are a few Mosquito men and Tongula Indians settled at this place; but no white people, nor their descendants,—we were plentifully supplied with provisions and other refreshments by the natives. The admiral, myself, and a few others, continued our journey along the beach as before; and, about midnight, we arrived on the banks of the Wava River, leading to a considerable lagoon of the same name, but the bar is both shallow and dangerous: a heavy sea falls on the coast, rendering the approach to it very unsafe, there being several shoals and small kays, either very inaccurately laid down, or not at all noticed in the charts."

There are Indians settled on the banks of a large river which flows into the Wava Lagoon: its source is said to be upwards of 150 miles in the interior.

Brancman's Bluff commands a most extensive view of low savannah land, covered with coarse long grass, and occasional pine ridges, with remarkably large and high pine timber. This is the character of most of the savannah land, on the coast of the Mosquito Shore; the only exception being that some of the *very low* land is covered with water, during the rainy season, producing only rank coarse grass and *mohoe* shrubs. The interior country behind Brancman's abounds in deer.

It is remarked, "that from the last quarter's ebb to the first quarter's flood, these deer are fond of grazing on the coast, a little above high-watermark."

North of the Bluff the land trends to the westward. There is only one river of any magnitude between Brancman's and Duckwarra. Sandy Bay is distant about thirty miles from Cape Gracios à Dios.

At the southernmost part of Sandy Bay there is an entrance to a small lagoon, on the borders of which is a principal settlement of the Mosquito Indians, where the former kings used frequently to reside; it is close to the Lagoon, about eight miles from its entrance, and in the vicinity of a grass and pine savannah. The lagoon has a communication with Wano or Warner's Sound, but no river of any consequence falls into either.

A ROYAL ORGY.—When Mr. Roberts arrived, the admiral was met and welcomed by the principal people; English colours were hoisted as the signal of festivity; a canoe arrived from the Cape, with information that the king was on his way to visit the settlement, and "having met the admiral, preparations were making for a grand feast and mishlaw drink." The whole population were soon busily employed collecting pine-apples, plantains, bananas, and cassava for their favourite liquor. The expressed juice of the pine-apple is alone an agreeable beverage. The *mishlaw* from the plantain and banana is said to be both agreeable and nutritive; that from the cassava and maize is intoxicating, and Mr. Roberts was disgusted at its preparation:—

"The root of the cassava, after being mashed, and peeled, is boiled to the same consistence, as when to be used for food. On its being taken from the fire, the water is poured off, and the roots allowed to cool. The pots were then surrounded by all the women, old and young, who, being provided with large wooden bowls, commenced an attack upon the cassava, which they chewed to a consistence of thick paste, and then put their mouthfuls into the bowls before them, until these vessels were filled; the bowls were then carried to the *king's house*, and the contents tumbled into a *new canoe* which had been hauled up from the landing-place, and put there for that purpose, there being no cask in the settlement sufficiently capacious. The masticating process, which was continued with much perseverance, until the joint produce of the wooden bowls, from every house in the settlement, had filled the canoe about one-third. Other *cassava* was then taken, and bruised in a kind of large wooden mortar, with a wooden pestle, to a consistence of dough, which was afterwards diluted with cold water, to which was added, a quantity of Indian corn, partly boiled and masticated in the same manner as the cassava; the whole was then poured into the canoe, which was afterwards filled with water, and frequently stirred with a paddle, until, in a few hours, it was in a high, and abominable state of fermentation. The canoe would contain about three puncheons, and there was nearly the same quantity prepared at two or three houses of the chief men, in the neighbourhood; besides the simply expressed juice of the pine-apple, and the plantain and banana mishlaw, being the ripe fruit roasted, bruised, and mixed with water."

There was also a present to the king, of about twenty gallons of rum, and a quantity brought by the admiral and his party, and a small quantity presented by Mr. Roberts. Earnee had invited the headmen and old people of Duckwarra, Wano Sound, and the neighbouring country and lagoons, "to meet the king, receive an account of the state of the different tributary settlements, which he had been visiting, transact public business, and get drunk."

The king's house, Earnee's, that of a Zambo chief designated *General Blyatt*, with a few others, were tolerably large and tolerably well furnished with benches, tables, plates, glasses, basins, knives and forks, and other articles. A hammock was hung up in the admiral's house for each of his guests, and, after a great deal of conversation about the state of the country, the customs, strength, and trade of the different settlements, and the general policy of the Mosquito men, they retired to rest.

"Early in the morning," says Mr. Roberts, "I was awakened by the noise of the drum; the natives were in a state of bustle and activity, preparing for the drinking-match and the reception of the king. He arrived in a large canoe, with ten people, escorted by the same number in two smaller ones. At the landing-place he was met by Admiral Earnee and General Blyatt, with some of the chief men of the neighbouring settlements; the two former dressed in uniforms, with gold epaulettes. There was little form or ceremony used in their reception of the king; a shake of the hand, and 'How do you do, king?' in English, being the only salutation from all classes. The king had returned four years previously from Jamaica, where he was semi-educated.

"He was then a young man, about twenty-four years of age, of a bright copper colour, with long curly hair hanging in ringlets down the sides of his face; his hands and feet small, a dark expressive eye, and very white teeth. He was an active and handsome figure, with the appearance of greater agility than strength. In other respects he was wild as the deer on his savannahs.

"During the day, Indians arrived from various parts of the coast and interior. At the meeting which took place in the king's house, various matters relative to the government of the neighbouring settlements, disputes, and other public business, were discussed; but the king, who *reigned but governed not*, left every thing to the discretion of Earnee, Blyatt, and a few others. He seemed to take little interest or trouble, further than to

sanction the resolutions passed, so that they might be promulgated as '*the king's own order*.' Such was the expression; and that order is invariably obeyed and carried into effect. During the time the council was sitting, no women were admitted; a few only were afterwards permitted to enter, during the drinking-match, to take care of their husbands when reduced to a state of insensibility by intoxication.

"The discussion in the king's house being ended, the feasting began. Two men were stationed by the side of the canoe, who filled the mishlaw drink into calabashes, which were then carried to the company by boys. As the men became exhilarated, they began to dance, in imitation of country dances and Scotch reels, learned from the former English settlers; but they soon became too much intoxicated to preserve order. Every one, including the king and his select friends at the admiral's house, gave way, without restraint, to the pleasures of drinking; and, during the evening, *the king's uncle Andrew*, chief man at Duckwarra, arrived, bringing one of his majesty's favourite wives. This chief was a short stout man, of unmixed Indian blood, very lively and quick in his motions, disguising, under an appearance of levity, much cunning and shrewdness; he spoke tolerably good English; and soon, by his ridiculous stories regarding the Jamaica traders, and by his satirical and witty remarks upon some of the old Mosquito men present, kept the company in a roar of laughter. The king observed to me, in the course of the evening, that I must not be surprised to see him act in the manner he was doing, as it was his wish, by indulging the natives, to induce them to adopt gradually, and by degrees, the English customs and mode of living; and he requested me to observe how far he had succeeded, pointing out to me that all present had thrown aside the *pulpera*, the common Indian dress, and wore jackets and trousers, with good hats. Some of them had coats, with other articles to correspond; and, as I have often repeated, they prided themselves upon being '*true English gentleman fashion*.'

"His majesty paid more attention to the women than to the chiefs; and said that the ladies here could dance fully as well as any of those at the former English settlements, proposed that I should join him, the admiral, and uncle Andrew, in a dance, and he would send for the women to join us. I of course readily assented to this proposal; and the females having arrived, we commenced dancing, to the sound of a drum, our only music.

"Blyatt had orders to keep the party in the king's house from interrupting us, but our music being full as noisy as theirs, and the secret of the women's arrival having transpired, our house was soon surrounded by a crowd, who pressed so much, that it became insufferably warm, and we were obliged to stop the dance; at which circumstance, many of the Indians expressed such disappointment, that the king good-naturedly proposed to renew the dance in the open air. The other party joining us with their music, we were soon all jumbled together, king, admiral, general, Mosquito men and women, in one mass of confusion and revelry. Before the chiefs became totally intoxicated, they ordered the women home to their houses, to prevent their being unable to take care of their husbands. The drinking was carried on with great perseverance during the night by old and young. The drums were beat and muskets fired, some of them loaded with powder to the very muzzle, until nearly all the assembly were in a state of beastly drunkenness, and taken care of by the women, who were occasionally called upon for that purpose. At intervals, however, as the men recovered, they found their way back to their favourite mishlaw, and renewed the debauch. All the next day was consumed in drinking, and it was not until the day following that the liquors were reduced to the very dregs of the cassava and maize. By the third night, the whole liquors were consumed, and the Indians began to retire to their respective homes, many complaining, with great reason, that '*their heads were all spoiled*.' It is however to their credit, that, during the whole of this debauch, I did not perceive the slightest quarrel."

When such were the habits of Mosquito royalty, and such the standard of morals, we may be justified in our opinion that society, which has grown out of both, demands thorough reformation.

The English drum is the principal musical instrument of the Mosquito men, who beat it with as much dexterity as the most practised European drummer. It came into use when the British forces were formerly on the Mosquito Shore, and has been a great favourite ever since, each settlement having one. They had also a rude pipe or flute, rather longer than a common flute, but much thicker, made of hollow bamboo, one end shaped like a flageolet, with hole and mouthpiece, and four finger-holes. It produced a dull monotonous tone, with very little variation. Two of these instruments were played together; the performers dancing a sort of minuet, in which they advance and recede, with the most grotesque gesticulations. One of their favourite dances was a kind of representation of an Indian courtship.

One of three principal chiefs of the Mosquito Shore, called Governor Clementi, would not come to this feast. The cause was that his late brother, commonly called Don Carlos (a name rather suspicious), had been, some time before, put to death by the king's people, on the presumption that he was too much attached to the Spaniards of Grenada and Nicaragua, with whom he had opened an intercourse, and had received from them considerable presents of cattle, &c. He was an Indian of pure blood, and considerable ability—the only man of that description, with the exception of his brother Clementi, who held any situation of consequence under the Mosquito king's government; he possessed great influence among the Indians, including the different tribes of Woolwas and Cookras. His immediate government extended from Sandy Bay to Pearl Kay Lagoon, and it was feared that in time he would become too powerful for the Mosquito men. Most treacherously and summarily they murdered him. Since then, his brother Clementi never visited the king, nor any of the settlements of the real Mosquito men. Robert, the king's brother, went some time before on a visit to Clementi, who received and treated them with great hospitality; but a negro belonging to the king, at a feast made in honour of Robert, grossly insulted Clementi by forcibly breaking up some of his repositories, and insisted upon carrying off certain articles. Robert declined to interfere, and Clementi shot the negro dead upon the spot. The king, not daring openly to attack the governor, endeavoured to revenge himself by seizing and driving away the cattle, whenever he had occasion for them;—but to prevent this annoyance, Clementi, voluntarily, destroyed or drove them away out of the king's reach.

During the time of Mr. Roberts' visit he informs us that—

“The king, previous to his return to the Cape, was desirous of conciliating Clementi. The king had other reasons for coming to friendly terms with him: he was aware that he had once grossly insulted Earnee, his best friend, and the only chief, since the death of ‘General’ Robinson, capable of governing the country,—by forcibly using freedoms, during Earnee's absence, with one of his favourite wives; and that, in consequence, Earnee had some time ago, formed an alliance with Clementi, by marrying Clementi's youngest sister, and might, in the event of a quarrel, join the governor.”

Mr. Roberts was requested by the king to accompany Blyatt, with about twenty people, to Clementi, with a king's letter, and to read to Clementi, in presence of Blyatt, who was to explain that "*the paper which spoke*, was the king's own self order, and must be obeyed."

"The Indians, on their long journeys, generally travel until ten o'clock in the morning, they then rest until two or three o'clock in the afternoon; then they continue their journey until daylight fails them. At the different halting places, they sleep upon a few palm leaves on the ground, slightly covered with a light blanket, and I generally rose refreshed, and never experienced any bad effects from this method of bivouacking; before going to rest, a fire is kindled, and the necessary provisions cooked. In travelling, they only wear the pulpera, but they carry with them, and put on a suit of their best clothes, at a short distance from the house of the person they mean to visit."

On arriving at a savannah, through which there was a good path to the governor's house, about a mile distant, the party dressed themselves, Blyatt, Mr. Roberts, and one or two others, mounted horses, which had been sent for our accommodation; they fell into Indian marching order, one before another, and with a flag and drum preceding them until they approached the governor's house, before which about twenty men, women, and many children were assembled. This residence was situated on a rising ground, commanding an extensive view of the savannah, on which there were several fine horses feeding, but no black cattle, although there was pasturage for many thousands.

The governor was sitting in his house, *dressed in state*, and rose to welcome Mr. Roberts and Blyatt, but took no notice of those who accompanied them.

"The appearance and demeanour of this old chief struck me very forcibly; and impressed upon my mind that I had, before me, a true descendant and representative of the ancient Indian Caziques. He was a tall, stout man, apparently about sixty years of age, with an Indian countenance, peculiarly expressive of thoughtful dignity; I could not help thinking, that he looked as if he felt degraded by the yoke of the Mosquito men,—that he had been born to command, and still felt conscious, like 'old Crozimbo,' that he was '*not* the least among his countrymen.' He was dressed in an old Spanish uniform, of blue cloth with red collar and facings, decorated with a great profusion of tarnished gold lace, an old embroidered white satin vest, ornamented with spangles, and having large pocket holds with flaps; a pair of old white kerseymere breeches, white cotton stockings, shoes, with silver buckles, and a large gold-headed cane, similar to those used by the superior Corregidores and Alcaldes of the South American provinces, completed his dress."

This ancient suit of clothes descended to him from his unfortunate brother. The dignified appearance and manners of this chief, contrasted strongly with the coarse brutality of the Mosquito men, and impressed on the mind of Mr. Roberts the conviction, that the domination of the Zamboes had materially retarded the prosperity of the genuine Indians. Clementi ordered refreshments, and provided plentifully, in a separate house, for those who came: allowing none but the principal men to sit at his own table.

After dinner, the king's letter was read, the governor expressed satisfaction; a tall young pine tree was cut, the English flag hoisted upon it in front of the house, and the governor seemed to feel, that he was treated with proper respect and reinstated in his rights and privileges. He pointed out two or three Indians who he conceived had disputed his authority, or injured him; they were imme-

diately secured by Blyatt's people, and tied up; but instead of being flogged in the usual way, the stripes were laid on a dried bull's hide, instead of the backs of the offenders. To have undergone this nominal punishment was considered by the free Indians a very serious degradation.

The land at this place was a low savannah covered partially with patches of large pine trees. The chief provision grounds of the governor's people was at a place called the Hills, from which circumstance they are known all over the coast by the name of *hill people*. The land at the hills, and to the westward, is extremely fertile and well cultivated, supplying the people at Sandy Bay, Cape Gracios à Dios, and other places on the coast with the greater part of their bananas, plantains, &c.

Clementi claimed the whole of the land, extensive savannah, and fine ridges, from hence to the coast, including the hills and interior country. He possessed the confidence of a numerous race of pure Indians.

The party returned through the same low tracts which they had recently travelled over:—

"A great part of this coast," says Mr. Roberts, "is during the rainy season, overflowed, and it is possible for a canoe to pass at that season, by inland navigation, from Para Lagoon, to Wava River; this is the case, generally speaking, with all the *low* savannah land, from Pearl Kay Lagoon to the Cape, and from thence to Plantain River."

At Duckwarra they were hospitably entertained by the king's uncle, Andrew: this jovial old man pressed them to remain some days with him and his friends, Rowla and Tarra, two of the chiefs. He was particularly well pleased with the appearance of the people at Andrew's settlement; they were a fine looking race; the men active, and good strikers of fish, and the women and girls were very handsome.

At Cape Gracios à Dios he found only a few houses, and these, with the exception of the king's and of one of his chief's, an old merchant's, they were mere huts.

The soil in the neighbourhood of the Cape is sterile, produces a coarse grass, and a few patches of cassava. The inhabitants depend on the hill country for food. There is pasturage, no grain, and good water is scarce. For a commercial place, and for grazing, it has advantages. It has an excellent harbour, secure from all winds, although in some parts open to the south, which seldom blows. It is capable of containing a large fleet in three to five fathoms water, with good holding ground, abounding in fish of various kinds; and frequented, at certain seasons, by innumerable flocks of teal and widgeon. It is at no great distance from the Mosquito Keys, whence can be procured, at all seasons, inexhaustible supplies of the finest green turtle. The Cape would probably be entirely deserted, if the vessels which call there were not induced to do so by the abundant supplies of turtle and tortoise-shell, and for the purpose of communicating with the king. Mr. Gunter, the celebrated London confectioner, has lately (1844) established a manufactory on the Mosquito Shore for preserving turtle.

The *Great Cape* or *Vankes*, or *Wanks River*, is said to have its source in the mountainous country, from which, near the Pacific, the Bluefields River originates. The Buccaneers, 158 years ago, in 1688, forced their way from the Gulf of Fonseca, on the Pacific, across the mountains, to the Spanish town of Nueva Segovia, and from thence, after crossing a formidable pass, and defeating the Spaniards, they arrived at the river Vankes, which they descended on small rafts or *pipirees*, between the shallows and cataracts; and, after crossing which, they made their way down to the Atlantic. They described its upper parts as being situated amongst rocky and precipitous mountains, with numerous falls; that its course is over a channel of prodigious rocks; and that it runs with great rapidity until within about sixty leagues of the sea. The length of its course is said to be 250 to 300 miles; and it passes through some of the richest land, and most romantic scenery in Central America. Within forty or fifty miles of its mouth the land becomes low, poorer, and sandy, with occasional ridges of pitch-pine, and some tracts of fertile mould; but, although the savannahs are fit for pasturage, and would support numerous herds, cattle is scarce.

The *Cape River* enters the ocean some distance to the northward of the bay, or harbour, and there is a shallow, canal-like communication, from the uppermost part of the latter, into the river, passable by canoes; and which might easily be enlarged so as to enable small vessels to avoid the dangerous bar of the river on which there is seldom more than four or five feet water. If commercial establishments were formed at the Cape, vessels might lie in safety at the upper end of the harbour all the year round; and if sufficient encouragement were given, the valuable products of the interior would be collected, brought down the river, and, by the communication alluded to, into the bay, and shipped at all seasons of the year.

The Zamboes are rather fishers, than cultivators of the soil; and, although they have, after many struggles, attained the ascendancy, they are by no means so estimable in a moral point of view, being treacherous, superstitious, and much more inclined to every species of debauchery, than the pure Indian, who, in general, adheres strictly to the truth. With few exceptions, the Zambo will not hesitate to violate every honest principle to accomplish the particular object which he may have in view. They are, however, hospitable, and have hitherto, on every emergency, cordially agreed with their neighbours in hatred to the Spaniards, and joined in defence of their liberties, whenever they considered themselves in danger. Their negro ancestors are said, by Mr. Bryant Edwards and others, to have been Africans from the Zambo country; some hundreds of whom were wrecked on this coast in a Dutch vessel, and that having by this means recovered their liberty, they travelled northwards, towards Cape Gracias à Dios;*

* This must have occurred a considerable time before 1688, for they were then settled in the country, who, according to the account of the Buccaneers, were descended from slaves who had escaped from a Spanish ship wrecked on the coast.

and, after several *rencontres* with the natives, came to a friendly understanding with them,—had *wives* and *ground allotted*; and have at length, by intermarriages, become in some measure an Indian people; who, were they under prudent and active chiefs, are, by their nature and disposition, well calculated to maintain their ascendancy. The Kharibees;* are darker in complexion, and superior in industry, to both the former classes; and, if they continue to increase with the same rapidity as at present, may, ultimately, form the majority at least in the country north of the Cape.

In sailing along the coast for Cape Gracios à Dios, False Cape is passed, situated about twenty-five miles distant from Great Cape River. The river Croatch, a short distance from False Cape, is of considerable size, with from nine to ten feet water over the bar—the land, on its banks, is fertile, although not much elevated, producing plantains, and other provisions, with which its inhabitants, who are Zamboes, supply those at the Cape.

Kukari is situated in a fertile savannah, having opposite to it a *haulover* from Caratasca Lagoon to the sea.

From *Kukari*, there is another *haulover*, into a small stream, leading to Caratasca Lagoon. The entrance to this lagoon (the *Bahia de Cartago* of the Spaniards), may, on sailing down the coast, be easily found; for, although the land on each side is remarkably low, the entrance to it is wide, and there are few conspicuous cocoa-nut trees at Croata, near to it; being the only cocoa-nut trees on the shore to the eastward of Patook River. It is of very considerable extent, varying in breadth, and having, in some places, the appearance of several lagoons running into each other, in various directions, for the most part, parallel to the coast, but nowhere exceeding twelve miles in breadth. One of these extends to within a very short distance of the River Patook, and communicates with it by a small inlet. It abounds in various sorts of fish of the finest description, particularly mullet, calapaner, snoak, çavallee, and also manatie; and, it is the resort of of ducks, widgeon, teal, and various aquatic birds. The Zamboes have settlements on its western borders, and quiet and peaceable unmixed Indians reside in the interior, or on the banks of the rivers which empty themselves into it. The land in the vicinity consists almost entirely of extensive and beautiful savannahs, covered with rich pasturage, and abounding in deer and game. Black cattle were formerly numerous, but the Mosquito men have not been provident enough to keep up the breed, selling all they could lay hold of, to the traders, who visit the lagoon, for the purpose of carrying them off. There are few pine trees at Croata, but on the opposite, or land side, there are ridges containing timber as large as any on the coast: behind these ridges, to the westward, the savannahs are bounded by gently rising hills, the summits of which are covered with luxu-

* We write the word not according to the European mode, but as it is universally pronounced on the coast.

riant vegetation. On the banks of the streams in the interior, there is both mahogany and cedar of the finest quality and largest size. Pimento and many valuable plants are indigenous. Croata or Crata, is about three miles distant from the entrance to the lagoon.

When Mr. Roberts visited this place, he says,

"We were received by Morton and his son Washington with the greatest cordiality; the former had recently succeeded to the authority and title of the late Captain Potts, well known at the Bay of Honduras as the chief of this settlement. Here we were hospitably entertained, the king (who was there at the same time), and his people being, from the following circumstance, kept in a constant state of excitement. A pipe of white wine had been discovered on the beach, and rolled to Morton's residence; he and his neighbours opened the cask, and continued drinking for several days, unremittingly, until it was finished. The men were, however, surprised to find that the women continued to be tipsy; they had also found a cask and concealed it in the bushes, for their own private use. This was soon discovered, and Morton, in rebuking them said, that, '*for woman to get drunk was not English lady fashion.*' This cask was also brought to the settlement, and the men recommenced drinking until all were completely satiated. The remainder, about half a pipe, was presented to us; and our party, after drinking as much as they could, carried off part of it as a sea stock."

To the north of this place canoes may sail inside the lagoon as far as Tabacounta, a small stream running from a branch of the lagoon into the ocean, about five miles from Patook. This stream has only three or four feet water at its entrance; and, in the best weather, it can only be entered by small canoes.

The Patook River has a strong current setting out of it; the bar, on which there is generally eight or ten feet of water, shifts in the rainy season, or during heavy gales, and occasionally leaves a sufficient depth for vessels of considerable burden. The tides, which seldom or never rise exceeding a few feet, ebb and flow into it for some miles; it is of considerable magnitude, being augmented by several tributary streams, the chief of which is the *Rio Barba* of the Spaniards; it has an inferior mouth, beside that already mentioned, falling into Brewer's Lagoon. It rises in a ridge of mountains, which separate it from the Great Cape River, and its course is estimated to be upwards of 150 miles. Some dangerous shoals lay off the principal entrance; and from Patook Point, which is on the eastern side, a shallow reef extends nearly two miles. The land in the interior of the Patook is very fertile, and provisions are plentiful. The inhabitants are negroes descended from slaves formerly belonging to a merchant who was settled at Black River. These negroes and their descendants have established themselves here in the same manner as those at Bluefields and Pearl Kay Lagoon. They rear some black cattle, horses, pigs, poultry, &c. They cultivated tobacco and a little rice, which they barter with their neighbours the Kharibeers.

Mr. Roberts says,

"The headman of the place is Jack, an old negro, who was a great favourite of the late Mosquito king, and intrusted by the present George Frederick with the keeping of the crown and other regalia, which he carefully conceals; the late king had secreted a considerable sum of money in a place known only to this man, through whose honesty

it was made known and recovered by the present king. Jack informed me, that he had frequently ascended the river as far as the back settlements of the Spaniards, with whom he occasionally bartered a few trifling articles brought to him by the Kharibees; that at one part of its course it has forced its way through a ridge of small hills, one of which was excavated by the stream, and completely arched, so that his dorie passed underneath, as if through a cavern, for a distance of nearly 500 yards. It is frequented by the largest alligators I have ever seen, but they seldom do mischief. Its banks are extremely fertile, and produce the banana and plantain in great perfection—a sure criterion of the excellence of the soil.”

The natives of this settlement possessed at that time a considerable number of horses, the breed of which had been obtained from Caratasca. It is said that being little used, and there being no sale, they multiplied so rapidly, that in the neighbouring savannahs hundreds were then to be found in a state of nature. About four miles below the settlement of Patook, is a village of the Kharibees who have spread themselves from Truxillo along the shore. The Kharib men wear shirts and trousers; the women generally go almost completely naked, having merely two small square pieces of red calico not larger than a common pocket handkerchief:—one of these suspended before, the other behind, and secured to the shape with small strings of silk grass; their manners are, however, modest and diffident; and the girls whenever observed, ran off to conceal themselves.

Brewer's Lagoon has a tolerably wide entrance, but it will not admit vessels drawing more than nine feet water. Three or four miles from the entrance is a small island, of moderate height, about two miles in circumference, fertile and formerly fortified by the English, who used to raise live stock and provisions upon it. It is overrun with trees, mangrove, and mohoe bushes; and some of the guns left by the British are said to remain where they were originally placed. It is stated that it could be fortified at very little expense, and would form a good station either for commerce or for settlers. The lagoon abounds in banks of very fine oysters, with fish and fowl in abundance. The country to the westward is diversified by gently rising hills, valleys, and savannahs; and the soil, generally speaking, is excellent.

About two miles from the mouth of the lagoon is Plantain River; a small stream, with a dangerous bar, passable only by canoes. On the banks of this river was the residence of a famous chief, “General” Robinson.* Black River Lagoon is about fourteen or sixteen miles long, and about half as broad; it contains several small islands, some of which were occupied for raising provisions and cattle, when the British held possession of Black River. On its

* The present commandant at Black River General Lowrie Robinson, is said to be, with some treachery of disposition, a perfect specimen of the Indians of the country, who have received a partial education. He was educated at Belize, and is the son of the late General Robinson, who combined extreme loyalty to his own king and affection for the British commandant. He drove the last Spaniard from Black River, and he enjoyed, in the latter part of his life, the confidence of Sir George Arthur, the then British superintendent at Belize. The present General Robinson was devoted to the late king, but he has since been intriguing with the authorities of the state of Honduras. The chief at Gracias à Dios is called Wellington.

borders are extensive savannahs and pine ridges, from whence the former settlers used to draw considerable quantities of tar, pitch, and turpentine: the ruins of the old works are still visible; and, from their appearance, must have been very extensive. Immense quantities of pigeons, teal, Muscovy ducks, and other birds, frequent the lagoon. There is a natural canal of moderate width about three miles in length, and the water of considerable depth, connecting the lagoon with Black River.

The point on which the British had formerly a small fort for the protection of the settlement was a place which was well chosen. The fort had been surrounded by a ditch, and could still, it is said, at a trifling expense, be made tenable. A new settlement was found about thirty years ago on the banks of a branch of the river, about three miles from its entrance. The situation was low and ill chosen a few houses had been put up on the site of part of the former town by the settlers. When visited by Mr. Roberts, they consisted of a Colonel Gordon of the independent service, Captain Murray and his wife, Captain Hosmore and his son, with three or four other white people.

“Colonel Gordon and his party had been settled some time previous to the arrival of the others; they had cleared a considerable quantity of land, and had already raised one crop, of about 500 bushels of Indian corn, with which Gordon had gone to Truxillo; having formed a contract with the commandant of that place to take all that he could raise. The quality appeared equal, if not superior, to any raised in the southern states of the union. Mr. Warren, an American, had been left in charge of the colonel’s plantation; good crops, and a ready demand for their produce, seemed to be anticipated by all parties. Young Hosmore, and another Englishman, had been up the river, on a visit to the Poyer Indians, whose first regular settlements are about forty miles from its entrance, and are extended, as high as the Spanish Embarcadero, about fifty miles further up. When there, they, by way of ascertaining how far the extensive trade formerly carried on could be revived, despatched an Indian to the Spanish town of Manto, or Olancho el Viejo; he was well received, and brought back letters from several *padres*, inviting young Hosmore to proceed to Manto, and sending mules to bring him, and the few goods he had, to that place. He immediately paid them a visit, was kindly received, and made proposals for a supply of dry goods, for which they offered specie, cattle, sarsaparilla, &c. They also tendered him, in the meantime, mules and cattle to assist in the formation of the settlement; *declaring that the withdrawing of the British from Black River had so injured their trade and former prosperity, that they would, willingly, use every exertion to open a communication with any new settlers.* Having no means of conveying the mules, &c., down the river, Hosmore was obliged to decline the offer. He made cautious inquiries regarding the mines in this part of the country, and procured some specimens of silver and gold ore, the former of which appeared equal to the Plata de Mina, that I had seen in the Pacific: the situation of several mines was known to some of the former settlers, and a regular survey was once attempted by a Colonel Despard, but being at an improper season of the year, it failed.”

Hosmore stopped on his way down the river to examine two mineral springs, one hot, the other cold, close to each other, situated at the base of an extensive ridge of mountains, extending through the country, in a westerly direction; connecting those which form the barrier between the Spaniards of Nicaragua, and the various unconquered Indians to the northward and eastward. The highest part of these ridges appeared to him by the course of the rivers to be about the

upper part of the Poyer country; and as the eastern side, in possession of the Spaniards, was known to be full of gold and silver ores, he considered that the Indian side is equally rich in these minerals. In passing up and down the river, he had landed at the ruins of some of the former English plantations, where he found sugar-cane, plantains, bananas, pine-apples, coffee bushes, &c. vegetating in a state of wild luxuriance. Mr. Hosmore's father had transplanted from thence several hundred coffee plants; but owing to their removal from a rich to a poor soil, the favourable result of his experiment was doubted. Peas, beans, cabbage, and some other vegetables, were grown; and the new settlers found no difficulty in procuring provisions. Fish, waterfowl, and game, were abundant. These, and trading conveniences, induced them to settle at this place in preference to ascending higher up, where the soil is fertile. The remains of the former church, hospital, and ruins of several houses, all built of brick made in the country—several sawpits, and other indications of the industry of the former settlers were visible.

When the new settlers arrived, they found a very old man of the name of Austin, who had been a resident during its former prosperity. He was nearly ninety years of age, and, after a variety of adventures, had found his way back to the old place, that he might spend his last days there, and be buried by the side of his former associates. By his directions the remains of the burial-ground had been searched, for the gravestone of one of his oldest companions; he cleared away the weeds and brushwood, and daily visited the spot until his death, which took place some weeks after the arrival of the new settlers, who buried him by the side of his ancient comrade.

Kharibee Settlements.—One of the principal Kharibee settlements was established about twelve miles from Black River. The Kharibs live on fowls, fruit, bread, and other provisions. The method of preparing Kharib bread, a considerable quantity of which is sent to Belize, and other places for sale, is as follows:—having selected from the plantations some of the largest and finest cassava roots, they are carefully skinned and washed; then grated upon large tin-graters, supplied by the traders; the substance is then washed in clean water, which is frequently shifted and run off, to free the cassava, which assumes a brownish colour, from a strong acid liquor, said to be poisonous; the whole mass, when sufficiently whitened, is put into a long bag or basket generally made of the spathes of a particular sort of tree; this basket is placed in a perpendicular position, between two posts; and, by the application of a lever, every drop of moisture is pressed out; the farinaceous substance is then dried in the sun, and either kept for use as a substitute made for flour, or into round cakes of eighteen or twenty inches in diameter, and about a quarter of an inch in thickness, toasted upon thin iron plates, over a clear fire of wood-ashes. When properly prepared, these cakes will keep for months, and when new, taste agreeably, and form a nutritious food. The flour is

also used in hot water as gruel, made more or less thick, seasoned with salt and Chili pepper, or sometimes eaten with sugar-cane syrup.

These Kharibeas are descendants of the aborigines found by the Spaniards on the Leeward Islands. Having become troublesome to the government of St. Vincent's, they were banished from that island, and came to Roatan, or Ruatan, an island in the Gulf of Honduras, with means presented to them to form a settlement there:—they were supplied with clothing, and a large vessel containing provisions, agricultural implements, and other stores, was placed in a secure harbour of the island, entirely at the disposal of their chiefs. From grief in exile they became improvident, and suffered the store-ship to sink at her anchors, with the greater part of every thing that was provided for their future success. The Spaniards from Truxillo invited many of them to that place, and they built a village to the westward of the town. Many of them entered the Spanish service, under subalterns appointed from their own tribe; and until lately they formed the majority of the population of Truxillo.

Some of them, however, emigrated from Truxillo, and from Roatan, to the Mosquito Shore, where they formed two principal settlements; one near the Great Rocks, about twenty miles to the westward of Black River, the other near Cape Cameron. The Mosquito king having given them encouragement, they extended a chain of small settlements as far as Patook. But by the oppressive conduct of the chief, General Robinson, and his successor Barras, they retired for security, and concentrated their dwellings to the northward of Black River, where they rapidly increased in numbers, and soon defied their enemies. Their houses are built more neatly than those of the Mosquito men, and have an air of greater comfort and independence. Each house has a small plantation attached to it, kept in neat order. They assisted the few settlers at Black River in erecting houses and clearing ground. Louis, one of their headmen, informed Mr. Roberts,

“ That they never interfered with the Indians by intermarriages or otherwise; and whatever their ancestors of St. Vincent's may have been, they were now honest and industrious. They are not so expert as the Indians at striking fish, or with the bow and arrow; but with the cutlass they are equal to the Valientes; and with muskets, of which every Kharibee has one, they excel all the Mosquito men and Indians. Their settlements are, in general, close to the sea-shore; they cultivate rice, cassava, sugar-cane, &c., and have abundance of hogs, ducks, turkeys, and other small stock, which, with considerable quantities of the bread already mentioned, they convey for sale to Truxillo and Belize. At the latter place they hire themselves, for several months at a time, to the mahogany and logwood cutters of the bay, and work with the regular woodmen.”

Their ancestors were the last descendants of the race which occupied many of the islands on the Carribean Sea when discovered by Columbus.

They are in general of a dark red colour, approaching to, and often not easily distinguishable from black; this colour arises from their ancestors having intermarried or crossed with the negroes of St. Vincent. They have the

short curly hair of the negro, but are remarkably clear-skinned, well made, active, and vigorous. "Their features," says Mr. Roberts, "are agreeable, particularly those of the young people; and I never could perceive any of that malformation of the head mentioned by some writers in their description of the Kharibees of the Orinoco. These latter, however, together with several other tribes inhabiting the banks of that river, the Canra and Cumana, who are said to be marked not only by that peculiarity, but also by superior size, and strength, were a different people, generally at war with the red men of St. Vincent's, and the other Leeward Islands." The country behind the Kharib settlements is fertile, hilly, and well watered by several rivers and streams, on the banks of which are abundance of the finest mahogany, dyewoods, sarsaparilla, and other natural productions of the soil. The Poyer Hills, or the Sierra de la Cruz, approaches close to the sea-coast.

ROATAN or RUATAN ISLAND is about thirty miles long, and eight or nine in breadth; the land is moderately high, covered with wood, except at the west end, where there are some savannahs on which mules and other cattle used to be raised. This beautiful island has an excellent harbour, easily defended; it was once in possession of the English, who erected batteries which completely commanded this harbour, and marked out a space at its end for the erection of a town. The woods are said still to abound in deer, wild hogs, gibeonites, pigeons, parrots, and other birds, many of them excellent food, and the whole coast swarms with fish, and with both green and hawksbill turtle. The English withdrew their troops from it at the time they abandoned the Mosquito Shore.

From Roatan Utila Island is visible. The soil of all these islands is described as rich, and well adapted for the cultivation of cotton, coffee, &c.; and the birds, fishes, and natural productions of each are similar. Innumerable flocks of parrots and pigeons fly about. Cocoa nuts are also very plentiful.

The Corn Islands, which lie off the Mosquito Shore, are subject to the king.

It is evident, from the foregoing sketches, that the Mosquito Territory comprises a most important portion of America. What its future destiny may be will, whether for good or for evil, altogether depend upon the policy that may be adopted in its administration. Some progress in the way of improvement has certainly been effected since the residence of Mr. Walker, in 1844, at Bluefields. British subjects have settled in various parts. None of the grants, irregularly obtained from the old king, can be considered legal. They never will be acknowledged by the present king, by the chiefs, nor by the people of the country, nor will they ever be countenanced by the British government.

From the reports which we have received from this territory during the years 1844, 5, and 6, it appears Mr. Walker, the resident agent, employs much of his time in endeavouring to improve the *morale*, and condition of the Creoles—to wean

the native population from their unsettled and wandering habits, and to unite all harmoniously together.

The conduct and appearance of the inhabitants is improved. Instead of taking the law in their own hands in cases of private quarrels, they frequently apply to the constituted authorities.

There is a small body of militia organised at Bluefields, amounting to eighty or a hundred, who are regularly drilled.

In 1841, great cruelties had been practised by the Creoles towards the Ramah and the Woolva Indians, especially on the part of the former, as employers, and the latter, as labourers—the agent proposed that the latter should be employed in improving bridges, roads, &c., and on the 20th of August, 1845, the commissioners of the regency of the Mosquito kingdom, caused a proclamation to be issued, forbidding any person to compel the services of relations of deceased natives, who died in debt, and establishing a register-office in Bluefields, where all persons are to bring their native servants, in order that their tenure of service may be explained and registered, and that the native population may be protected and not compelled to do service unless proper contracts have been made. These regulations to take effect from the 1st of January, 1846.

There was no clergyman in the Mosquito Territory in 1845, at Bluefields. The construction of a church (for which the agent has some funds), a lock-up house—and a house for strangers—like the *casa real* in every puebla of the Spanish republic, are all considered by him immediately necessary.

The various Indians passing to and from the turtle fishery, if they have not friends in the place, sleep in open boat-houses. With chiefs to superintend these works, the agent conceives such buildings the best way to expend the bounty provided for the Indians by the British government.

He says that the inhabitants are beginning to refer their complaints to the regular authorities, instead of proceeding, as formerly, to acts of personal violence; the serve in the militia, and are ready to contribute their assistance to the construction of public works. But the Creoles and Zamboes are generally addicted to idleness—and the few Spaniards who are found in different parts, are of very suspicious character.

TRADE AND NAVIGATION.

The trade is chiefly an irregular coasting trade, and an account of it cannot be accurately ascertained.

In 1844, a proclamation was issued by the Mosquito government, in accordance with the approbation of the British agent, by which it is provided,

1. That a tonnage duty of a quarter of a dollar per register ton shall be levied on all decked vessels, Spanish barques, and other large boats carrying merchandise for the purpose of trade on the coasts and in the ports of the Mosquito territory and its islands.

Vessels not breaking bulk and not landing any part of their cargoes, may remain forty-eight hours without payment of such duty.

2. That Bluefields shall be a free warehousing port for goods to be deposited in the general warehouse until reshipped.

3. On payment of said tonnage duty vessels may trade in any Mosquito port for three months.

After the 1st of January, 1845, all turtling vessels to have licences, for which sixteen dollars per annum to be charged.

Each turtling vessel without such licence to be fined fifty dollars—and the seizure of the turtle and shell found on board.

5. The destroying of turtle eggs strictly forbidden, under a fine of five dollars for each offence.

6. Licence must be obtained for selling spirits; for each licence ten dollars to be paid.

Penalty, ten dollars, and seizure of liquors.

The charge payable to the crown for cutting mahogany is two dollars each tree.

Poll taxes were previously levied throughout the whole country, abolished in 1844, by proclamation.

An ensign and standard for the Mosquito nation were sent to the country from England.

The return of trade of Bluefields for 1844, included no duties of British entry, while the return for 1845, shows imports to the amount of 2708*l.* sterling, and exports, the produce of the country, to the amount of 750*l.* sterling. Foreign imports also to have increased to 1428*l.* sterling. But these statements embrace only a part of the trade, having little of the import trade.

Gross Return of British and Foreign Trade at the Ports of Bluefields and Corn Island.

BOOK VI.

CENTRAL AMERICA;

OR,

GUATEMALA.

CHAPTER I.

GEOGRAPHICAL POSITION—CONFIGURATION—CLIMATE—POPULATION—MINERALS—FORESTS—WILD ANIMALS—LAKES—AND RIVERS.

CENTRAL AMERICA, Guatemala, or Guatimala, extends from about 8 deg to 18 deg. north latitude, and between 82 deg. 30 min. and 94 deg. west longitude, between Cape Gracios à Dios, on the Caribbean Sea, and Point Cosiguina, in the Pacific Ocean.

The area, estimated by Humboldt in 1822, was about 125,550 square miles. This calculation was made according to the then existing charts, which were discovered afterwards, by the surveys directed by the British Admiralty, to have laid down the east coast south of Cape Gracios à Dios more than thirty miles too far east. The area, therefore, may be more properly estimated at about 120,000 square miles: nearly equal to that of the United Kingdom. This area includes the Mosquito Territory, which we have described in the last book.

On the north it is bounded by the States of Mexico and Belize, on the south-eastern by New Granada, on the east by the Atlantic, and on the west by the Pacific.

This extensive region is remarkably irregular in its configuration. Mountains, elevated plains, ravines, lakes, rivers, bays, harbours, lagoons, forests, and low lands, are its predominating features.

There are numerous fertile valleys, and the plateaux or table-lands, which are, however, but imperfectly known, are described as generally fertile. The mountain elevations rise from 5000 to 13,000 feet above the sea. Many of them if not the whole, are of volcanic formation. The country has been frequently disturbed by earthquakes.

Its soil, its climate, and its productions, are as varied as its configuration. Its lowlands, both on the Atlantic and Pacific coasts, are considered remarkably unhealthy.

Climate.—The whole of Central America is situated between the tropics; but the temperature and salubrity of its climate are as variable as are the diversities

of its abrupt elevations, mountains, plateaux, ravines, sands, low districts, lakes, and forests.

It freezes sometimes during the night on the highest part of the table lands, in November, December, and January. At the city of Guatemala, situated in the mean height of the table land (4961 feet above the sea), the dry season begins towards the close of the month of October, and lasts till the end of May: during which time only a few showers occasionally fall. In the beginning of June thunder storms become frequent, and are followed by heavy rains. From six o'clock in the morning till three or four o'clock in the afternoon, the sky is generally without clouds, and the air clear and refreshing. About the middle of October the north winds blow, and the rains cease. The absence of either the windy or rainy seasons is accompanied by thunder; and, it is said, with slight shocks of earthquake. In March and April the thermometer sometimes rises to 86 deg. It generally ranges between 74 deg. and 82 deg. in the middle of the day. In December and January, when the north winds sometimes blow with great force, the thermometer varies between 68 deg. and 72 deg. During the summer heat it rises at about seven o'clock in the morning to between 60 deg. and 67 deg., and in the evening at the same hour, to 67 deg. and 68 deg; in winter it falls in the morning to 60 deg. and 58 deg., and sometimes even to 56 deg., but in the evening only to between 60 deg. and 64 deg. Towards the end of the dry season the trees shed their leaves, and in many places vegetation appears suspended. The region in which the capital stands, is considered healthy; *goîtres* are frequent in the high and mountain districts, especially among the mixed races.

On the sea-coast of the Pacific, the seasons correspond with those of the table lands, but the temperature is much hotter. It is said that the Pacific shores are healthy, although they are almost entirely covered with woods. This salubrity is, however, not without exceptional districts.

The climate of the low eastern coasts is remarkably hot, and the seasons irregular. Below the table land it rains for a longer period than on the western shores,—but the rains are not generally heavy. The rains and hot temperature render the climate in many parts unhealthy.

POPULATION.—The inhabitants of Central America comprise three classes—whites, or creoles of Spanish race, mestizos, or the offspring of whites and Indians, and aboriginal natives. There are but few negroes or Zamboes. In the department of Guatemala the Indian inhabitants are said to constitute the great majority of the people: in Costa Rica those of European race predominate; and in the three other departments the mestizos, mixed with a few mulattoes prevail. Haefkens estimates the whole population at one million and a half, which he distributed as follows, viz.;—of European races, 125,000; mixed races, 500,000; Indians 875,000; total 1,500,000. But it is doubtful whether any approximate estimate can be formed. Many parts, as the

inland parts of the Mosquito Territory, the region bounding Yucatan, and part of Honduras, are very little known.

The whites have monopolised nearly all the offices and dignities in the state, except under Carera, the present Indian ruler of the province of Guatemala. The handicraftsmen, shopkeepers, and small tradesmen generally, are chiefly of mixed races. The aborigines are the principal inhabitants of the table-lands.

MINERALS.—Gold, silver, and iron mines are worked; lead and mercury have been found. The most important gold and silver mines are those of Costa Rica, at Del Aquacate, and in Honduras, in Mount Merendon, between Chiquimula and the northern shores, and at Del Corpus and Tabanco. The iron mines are situated near Santa Anna, in Salvador 75,000 tons were said to have been produced annually; but these mines are nearly altogether, like most branches of industry, now neglected. This has been the natural consequence of the many revolutions and distractions which have disturbed the peace of the country. In Honduras, jasper and marble are worked. Brimstone is collected near the volcano of Quezaltenango. There are many salt springs, and salt is collected on the banks of some lagoons, as well as on the shore of the Pacific, in such quantities so as to constitute an article of commerce.

FORESTS.—Dense forests of gigantic trees cover a great part of Central America. Among the most valuable products of these forests are mahogany, pimento, sarsaparilla, vanilla, and the black or Peruvian Balsam; the latter, only found in the district of Salvador, besides other drugs and gums; also the Brazil or Nicaragua wood, and many other beautiful and useful woods.

The low country between the Pacific and the table lands and mountains, varies in breadth from thirty to fifty miles. A forest which covers all the plain, is remarkable for magnificent trees; some of them from thirty to thirty-five feet in circumference, and eighty or ninety feet in height: numerous creepers wind round their trunks to the height of forty or fifty feet. These forests consist chiefly of mahogany, cedar, Brazil, guaiacum, Santa Maria, and other useful woods: vanilla, sarsaparilla, and other medicinal plants abound.

WILD ANIMALS.—The wild animals, reptiles, and birds common to tropical South America are found in Central America. Fish abound in the rivers and lakes, and along the shores of the east and west coasts. Alligators are also numerous in the Usumasinta and numerous rivers.

LAKEs.—Exclusive of the Great Lake of Nicaragua, there are many others; chiefly near the Pacific, and there are several lagoons, with sheltered entrances on the shores of the Caribbean Sea. Caratasca Lagoon is forty miles long and more than ten broad. These lagoons are all separated from the sea by narrow and sandy ridges.

The Lake of Nicaragua is described by Juarros as—

"Being more than 180 miles long from west to east, and nearly 100 broad from north to south, having almost everywhere a depth of ten fathoms, with a muddy bottom, except along the shore, where there is clean sand. The city of Nicaragua is supplied with water from the lake, which also furnishes an inexhaustible abundance of fine fish. It is rendered extremely picturesque, by the numerous small islands with which the surface is studded; these are all uncultivated, except Ometep, which is inhabited. On this there is a lofty mountain of a conical shape, that is an active volcano, and frequently emits both flames and smoke. The lake itself is liable to tempestuous agitations, when the waves rise with violence, as they do in the open sea, under the impetus of a heavy gale. Although a great number of rivers fall into this basin, and the River St. Juan is the only visible outlet, yet it is remarked as an extraordinary phenomenon, that there is no indication at any time of increase or decrease of the waters. On the north, the district of Matagalpa, and many large farms for breeding cattle, border the lake; on the south are the city of Granada, and the town of Nicaragua; on the east the River St. Juan communicates with the Atlantic; and on the west is the Lake of Managua, or Leon, which extends upwards of fifty miles in length, by nearly thirty in breadth, and is connected by a canal with the Nicaragua."

These two lakes are described by Juarros as much larger than they are by recent accounts.—(See account of the Peninsula of Nicaragua hereafter.)

The Lake of Atitlan, according to Juarros, is one of the most remarkable in the kingdom. It is about twenty-four miles from east to west, and ten from north to south, entirely surrounded by rocks and mountains. There is little gradation of depth from its shores, and the bottom has not been found with a line of 300 fathoms. It receives several rivers, and all the waters that descend from the mountains, but there is no known channel by which this great body is carried off. The only fish caught in it are crabs, and a species of very small fish. These are in such countless myriads, that the inhabitants of the surrounding villages carry on a considerable fishing for them.

From the ignorance which still prevails in regard to the geography and geology of this district, it is probable that Juarros' account of its fathomless depth, and the absence of any visible outlet, are mere assumptions. Mr. Stephens denies the assertion of the coldness of its water. The south and mountain regions of it are subject to showers and squalls; and this was also observed by Mr. Stephens.

"At that hour of the day, as we understood to be the case always at that season of the year, heavy clouds were hanging over the mountains and volcanoes, and the lake was violently agitated by a strong southwest wind; as our guide said, '*la laguna es muy brava.*'"

The configuration of the country succeeding Lake Atitlan, is of the most varied and romantic character. A lofty table of land and mountains almost surround this lake.

"From a height of 3000 or 4000 feet," Mr. Stephens says, "we looked down upon a surface shining like a sheet of molten silver, enclosed by rocks and mountains of every form, some barren, and some covered with verdure, rising from 500 to 5000 feet in height. Opposite, down on the borders of the lake, and apparently inaccessible by land, was the town of Santiago Atitlan, between two immense volcanoes 8000 or 10,000 feet high. Further on was another volcano, and further still another, more lofty than all, with its summit buried in clouds. We stopped and watched the fleecy clouds of

vapour, rising from the bottom, moving up the mountains and the sides of the volcanoes."

Along the slopes leading down to the lake, the temperature grows hotter as the path descends. Mr. Stephens describes it as a tropical garden. Above, on the plateau, the climate was more like that of Central Europe than that of the tropics. Between the forest trees and the lake there flourished :

" Sapotes, jacotes, aguacates, manzanas, pine-apples, oranges, and lemons ; the best fruits of Central America grew in profusion, and aloes grew thirty to thirty-five feet high, and twelve and fourteen inches thick, cultivated in rows, to be used for thatching miserable Indian huts. We came down to the lake at some hot springs, so near the edge that the waves ran over the spring, the former being very hot, and the latter cold."

The celebrated Lake Itza, or Peten, lies between Verapaz, Chiapa, and Yucatan. It is described, by Juarros, as of an oblong figure and about twenty-six leagues in circumference : in some parts there are thirty fathoms depth, and in others still more ; the water is pure, and abounds with excellent fish. The Peten, or Great Island, is about two leagues from the shore, and was the chief place of the Itzax Indians ; it is steep and lofty, and on the summit there is a plain nearly a quarter of a league in diameter, where the Indians and their king, *Canek*, resided. In 1698 a garrison was established in this place. Four other smaller islands lie at short distances from the principal one. All these five islands, the whole of the eastern side of the lake, and the neighbouring range of mountains, were formerly thickly peopled by the Itzax nations.

The Lake of Guixa, near the boundary-line between the States of Salvador and Guatemala, is more than twenty miles long, and three broad in the widest part : it abounds with fish, and forms the source of the Lempa. It is said to be connected with another lake, that of Metapa, by a subterraneous channel.

Rivers.—The rivers of Central America are numerous ; but rapid, and of comparatively inferior magnitude. Those flowing into the Pacific have rarely their sources more than sixty miles from the sea. The Lempa rises on the western extremity of the table-land, and flows from west to east, receiving in its course a river from the Lake of Guixa, and a small stream which passes the town of St. Salvador. The Lempa thence flows south, and rapidly to the Pacific. It is said not to be navigable, and has a bar at its mouth. The Rio Choluteca which falls into the Bay of Conchagua draining a narrow valley, is next in size to the Lempa.

The Patook flows into the Caribbean Sea, and is said to bring down gold with its stream from the hills. There are rapids called *Los Chiflones*, from which to its mouth the river is said to be navigable for large river barges, and still higher for canoes.

The Rio Tinto flows for about 200 miles, and falls into the sea east of Cape Cameron, but its course is little known.

The Rio Wanks, or Rio de Segovia, rises towards the southern extremity of

the table-land, and flows into the sea near Cape Gracios à Dios, but the greater part of its course lies in the plain of Mosquitos. Bluefields River appears to rise on the southern extremity of the table-land, and falls into Mosquito Bay near 12 deg. north latitude.—(*See account of the Mosquito Shore.*)

Along the high coast, between Cape Cameron and the bottom of the Bay of Honduras, there are several smaller rivers: the Rio de Lean, Rio Ullua, and Chama-lecon, are navigable to some extent for small river barges or piraguas, and the first and last for small schooners.

The river Michatoyat flows from the Lake of Amatitan, and forms at its mouth the harbour of Istapa or Independencia in the Pacific.

The Motagua, the largest river that falls into the Bay of Honduras, rises at the foot of the western slope of the table-land, about 15 deg. north latitude, and flows east, forming numerous rapids and cataracts, as it descends from the high-lands. At Gualan, about 100 miles from its mouth, it becomes navigable for flat river boats. A surf breaks over its bar, as it flows into the Golfo Dulce. The beautiful scenery of this river is enthusiastically described by Mr. Stephens. The Polochic rises on the eastern table-land, becomes navigable immediately after its descent at the Embarcadero de Teleman, and is said to be at all seasons deep enough for vessels drawing several feet of water (?) but the bar at its mouth has only from three to four feet of water. This river also flows into the Golfo Dulce.

The USUMASINTA is considered the largest river of Central America. Its principal branch, rises in the table-land, not far from the Motagua. After a course of nearly 100 miles it is joined on the right by the Rio de la Pasion, which rises further east, and about seventy miles from the Gulf of Honduras. From this junction the Usumasinta flows about fifty miles more through the table-land, from which it descends by cataracts. Some miles below which, near a small stream, are the unaccounted-for ruins of Palenque, in the republic of Chiapa, through which country the Usumasinta runs more than 150 miles. In this part of its course it is joined by two tributaries, the Tulijà and Tabasco. Below the cataracts it is navigable for boats of considerable burden. It falls under the name of Rio Tabasco, into the Bay of Campeachy, where its principal branch forms the port of Victoria. The bar at its mouth is passed over by vessels which sail up to St. Juan Batista. Another branch falls into the Lago de Terminos.

Mr. Stephens, in his work on Yucatan gives some interesting sketches of the Usumasinta. From the ruins of Palenque he returned to the Indian village of Palenque, eight miles from these ruins, and on the bank of the Chacomel, a tributary of the Usumasinta. From this village he entered a beautiful plain, ornamented with trees: this plain, traversed by streams, extended to the Gulf of Mexico. On the borders of a wood-land, he observed

singular trees, with a tall trunk, the bark very smooth, and the branches festooned with birds'-nests. The birds were called the *jagua*, and he was told by the padre they nestled in this tree to prevent serpents getting at their eggs or young birds.

He then travelled by a muddy road through a picturesque country to Las Payas, a village on the Usumasinta. The whole of the great plain downwards to the gulf he describes as intersected with creeks and rivers. Some of them dry in summer, and on the rising of the waters, overflowing their banks. At this place the principal food of the people was young alligators, killed when about a foot and a half long. He says, "They tasted better than the fish, and were the best food possible for our canoe voyaging."

"At seven o'clock we went down to the shore to embark. The boatmen whom the justice had consulted, and for whom he had been so tenacious, *were his honour himself and another man*, who we thought was hired as the cheapest help he could find in the village. The canoe was about forty feet long, with a *toldo* or awning of about twelve feet at the stern, and covered with matting. All the space before this was required by the boatmen to work the canoe, and, with all our luggage under the awning, we had but narrow quarters. The seeming lake on which we started, was merely a large inundated plain, covered with water to the depth of three or four feet; and the justice in the stern, and his assistant before, walking in the bottom of the canoe, with poles against their shoulders, sent her across. At eight we entered a narrow, muddy creek, not wider than a canal, but very deep, and with the current against us. The setting pole could not touch the bottom, but it was forked at one end, and keeping close to the bank, the bogador or rower fixed it against the branches of overhanging trees, and pushed, while the *justice*, whose pole had a rude hook, fastened it to other branches forward, and pulled. In this way, with no view but that of the wooded banks, we worked slowly along the muddy stream. In turning a short bend, suddenly we saw on the banks eight or ten alligators, some of them twenty feet long, huge, hideous monsters, appropriate inhabitants of such a stream, and, considering the frailty of our little vessel, not very attractive neighbours. As we approached, they plunged heavily into the water, sometimes rose in the middle of the stream, and swam across or disappeared. At half-past twelve we entered the Rio Chico, or *Little River*, varying from two to five hundred feet in width, deep, muddy, and very sluggish, with wooded banks of impenetrable thickness. At six o'clock we entered the great Usumasinta, five or six hundred yards across, one of the noblest rivers in Central America, rising among the mountains of Peten, and emptying into the Lake of Terminos."

The three republics or states of Chiapos, Tobasco, and Yucatan, bound each other at the junction of the Usumasinta and the Rio Chico. After leaving the flooded country below *Playas*, they ascended the River Chico. Crossing the point of the junction, after ascending the current of the Rio Chico, they turned into the descending flood of the Usumasinta.

"At this time," says Mr. Stephens, "away from the wooded banks, with the setting poles at rest, and floating quietly on the bosom of the noble Usumasinta, our situation was pleasant and exciting. A strong wind sweeping down the river drove away the Moscheteos, and there were no gathering clouds to indicate rain. We had expected to come to for the night, but the evening was so clear that we determined to continue. Unfortunately, we were obliged to leave the Usumasinta, and about an hour after dark turned to the north into the Rio Palisada. The Usumasinta in its stately course receives many, and sends off other tributaries to find their way by other channels to the sea.

"Leaving the broad expanse of the Usumasinta, with its comparative light, the Rio

Palisada narrow, and with a dark line of forest on each side, had an aspect fearfully ominous of Moschetoes. Unfortunately, at the very beginning we brushed against the bank, and took on board enough to show us the blood-thirsty character of the natives (*Moschetoes*). Of course, that night afforded us little sleep. At daylight we were still dropping down the river. This was the region of the great logwood country. We met a large bongo with two masts moving against the stream, set up by hauling and pushing on the branches of trees, on her way for a cargo. As we advanced, the banks of the river in some places were cleared and cultivated, and had whitewashed houses, and small sugar-mills turned by oxen, and canoes were lying on the water; altogether, the scene was pretty, but with the richness of the soil suggesting the idea how beautiful this country might be made. At two o'clock we reached the Palisada, situated on the left bank of the river, on a luxuriant plain, elevated some fifteen or twenty feet. Several bungaloes lay along the bank, and in front was a long street with large and well-built houses. This, our first point, was in the state of Yucatan, then in revolution against the government of Mexico. Our descent of the river had been watched from the bank, and before we landed we were hailed, asked for our passports, and directed to present ourselves immediately to the *alcalde* (Don Francisco)."

Palisada made its *pronunciamiento* but two weeks before, the central officers had turned out, and the present alcalde was hardly warm in his place. The change, however, had been effected with a spirit of moderation and forbearance, and without bloodshed. Don Francisco, with a liberality unusual, spoke of his immediate predecessor as an upright but misguided man, who was not persecuted, but then living in the place unmolested. The liberals, however, did not expect the same treatment at the hands of the centralists. An invasion had been apprehended from Tobasco. Don Francisco had his silver and valuables packed up, and kept his bongo before the door to save his effects and family, and the place was alive with patriots brushing up arms and preparing for war.

This Don Francisco is described as a rich man; had a hacienda of 30,000 head of cattle, logwood plantations, and bungaloes, and was rated at 200,000 dollars.

He received Mr. Stephens most hospitably; dinner was served in a style unusual in Yucatan. He had two sons, whom he intended to send to the United States to be educated.

"For the first time," says Mr. Stephens, "in a long while, we had bread made of flour from New York, and the barrel head had a Rochester brand. Don Francisco had never travelled further than Tobasco and Campeachy, but he was well acquainted with Europe and the United States, geographically and politically; indeed, he was one of the most agreeable companions and best-informed men we met in that country. We remained with him all the afternoon, and towards evening moved our chairs outside in front of the house, which at evening was the regular gathering-place of the family. The bank of the river was a promenade for the people of the town, who stopped to exchange greetings with Don Francisco and his wife; a vacant chair was always at hand, and from time to time one took a seat with us. When the vesper-bell struck, conversation ceased, all rose from their seats, made a short prayer, and when it was over, turned to each other with a *buenos noches*, reseated themselves and renewed the conversation. There was always something imposing in the sound of the vesper-bell, presenting the idea of an immense multitude of people at the same moment offering up a prayer."

On leaving this hospitable Don, Mr. Stephens embarked on board a bongo for Laguna. This craft was about fifteen tons, flat-bottomed, with two masts and

sails, and loaded with logwood. This deck was covered with mangoes, plantains, and other fruits and vegetables. An awning was formed by stretching a sail over the deck.

On leaving the town, they passed an island about four leagues in length, and a large farming establishment, with canoes lying opposite, in which all intercourse appears to be confined. The rivers and flooded country being the only high roads. Below this farm no habitations appeared. The Usumasinta was deep, the banks densely wooded, and overhung with broad-spreading branches of the most luxuriant vegetation. Alligators seemed to be the possessors of these waters.

"Some lay basking in the sun on mud-banks, like logs of drift-wood, and in many places the river was dotted with their heads. The Spanish historian says that they swim with their heads above the water, gaping at whatsoever they see, and swallow, whether stick, stone, or living creature, which is the true reason of their swallowing stones; and not to sink to the bottom as some say, for they have no need to do so, nor do they like it, being extraordinary swimmers; for the tail serves instead of a rudder, the head is the prow, and the paws the oars, being so swift as to catch any other fish as it swims. A hundred weight and a half of fresh fish has been found in the maw of an alligator, besides what was digested; in another was an Indian woman whole, with her clothes, whom he had swallowed the day before; and another with a pair of gold bracelets, with pearls and enamel gone off, and part of the pearls dissolved, but the gold entire."

Mr. Stephens was informed by Don Francisco, that on the previous year a man had had his leg bitten off by an alligator, and was drowned. The *Patron* of the bungo told him that at the end of the last dry season upwards of 200 had been counted in the bed of a pond. Bungo men attacked them with clubs, sharp pickets, and machetes, and killed upwards of sixty.

"The river itself," says Mr. Stephens, as they floated downwards; "discoloured with muddy banks, and a fiery sun beating upon it was ugly enough; but these huge and ugly monsters, neither fish nor flesh made it absolutely hideous. The boatmen called them *enemigos de los Christianos*. We brought out our guns and made indiscriminate war. One monster, twenty-five to thirty feet long, lay on the arm of a gigantic tree, which projected forty or fifty feet, the lower part covered with water, but the whole of the alligator was visible. I hit him just under the white line, he fell off with a tremendous convulsion, reddening the water with a circle of blood, and turned over on his back dead. A boatman, and one of the Petan lads got into a canoe to bring him alongside.

"Our track down the river will be remembered as a desolation and a scourge. Old alligators, by dying injunction, will teach the rising generation to keep the head under water when the bungoes are coming. We killed, perhaps, twenty, and others are probably sitting on the banks with our bullets in their bodies wondering how they came there. With rifles we could have killed at least a hundred."

The following appears to be descriptive of a phenomena characteristic of the climate:—

"At three o'clock the regular afternoon storm came on, beginning with a tremendous sweep of wind up the river, which turned the bungo round, drove its broadside up the stream, and before we could come to at the bank we had a deluge of rain. At length we made fast, secured the hatch over the place prepared for us, and crawled under. It was so low that we could not sit up, and lying down there was about a foot of room above us. On our arrival at the Palisada we considered ourselves fortunate in finding a bungo ready, although she had already on board a full load of logwood from stem to stern."

In the evening the rain ceased, and afterwards the wind and the clouds rolled away, the sun shone forth, and Mr. Stephens says, "But for the abominable insects (*moschetoës*), our float down the wild and desolate river would have been an event to live in memory ; as it was, not one of us attempted to sleep ; and I verily believe a man could not have passed an entire night on the banks and lived."

Next morning they entered the Bocca Chico, or little mouth, one of the branches of the Delta of the Usumasinta. The banks were overhung with the branches of magnificent trees. In a few hours the stream floated them into the Lake, or Laguna, de Terminos. "Once more in salt water," says Mr. Stephens, "and stretching out under full sail, on the right we saw only an expanse of water : on the left was a border of trees, with naked rocks, which seemed leaping out of the water ; and in face, but a little to the left and barely visible, a long line of trees marking the island of Carmen, on which stood the town of Laguna, our port of destination." The passage from the river to the lake is described as shallow, narrow, and intersected by sand-bars and reefs. Soon after passing these dangers. they came in sight of the vessels anchored at Laguna. A calm followed. The heat on the lake was indescribably oppressive. A sudden storm of lightning, thunder, wind, and a deluge of rain followed about three o'clock. In about an hour this awful phenomena passed away. It being quite calm, the bungo was then towed towards the town ; a squall, with a flood of rain, broke suddenly over them before reaching the harbour ; a surf broke over the beach, and after the squall ceased, they were landed in a boat belonging to one of the many vessels at anchor. In the town they found stores, cafés, barbers shops, and depôts of logwood.

CHAPTER II.

HARBOURS AND TOWNS OF CENTRAL AMERICA.

THIS region has some excellent deep harbours, and several good ones for small vessels.

The *Gulf of Honduras* is situated between the northern Mosquito Shore and the Peninsula of Yucatan. At the bottom of the Gulf is the Bay of Honduras. Motagua and several lesser rivers flow into this bay ; which also contains the ports of Omoa and of Yzabal (the latter within the Golfo Dulce). Within this bay are smaller bays, of which that of San Thomas is spacious and deep. The communication from Yucatan or Belize is long and tedious, as vessels have to beat against the trade wind. To obviate this delay, a steamboat should be estab-

lished to run from Belize to the different ports of Honduras and the Mosquito Territory.

The *Golfo Dulce*, is a lagoon about thirty miles long. The shores are wooded.

The Rio Dulce, which flows from the lagoon into the Bay of Honduras, is about twenty miles in length, including the smaller lagoon, or Golfetta, which is about ten miles long.

The entrance to the Gulf of Dulce is described as follows in Mr. Stephens' work on Central America :

"A narrow opening in a rampart of mountain woeed us on, and in a few moments we entered the Rio Dulce. On each side, rising perpendicularly, from 300 to 400 feet was a wall of living green. Trees grew from the water's edge, with dense, unbroken foliage to the top; not a spot of barrenness was to be seen; and on both sides, from the tops of the highest trees long tendrils descended to the water, as if to drink and carry life to the trunks that bore them. It was, as its name imports, a Rio Dulce, a fairy scene of Titan land, combining exquisite beauty with colossal grandeur. As we advanced the passage turned, and in a few minutes we lost sight of the sea, and were enclosed on all sides by a forest wall; but the river, although showing us no passage, still invited us onward. Could this be the portal to a land of volcanoes and earthquakes, torn and distracted by civil war? For some time we looked in vain for a single barren spot; at length we saw a naked wall of perpendicular rock, but out of the crevices, and apparently out of the rock itself, grew shrubs and trees. Sometimes we were so inclosed, that it seemed as if the boat must drive in among the trees. Occasionally, in an angle of the turns, the wall sunk, and the sun struck in with scorching force, but in a moment we were again in the deepest shade. From the fanciful accounts we had heard, we expected to see monkeys gambolling among the trees, and parrots flying over our heads; but all was as quiet as if man had never been there before. The pelican, the stillest of birds, was the only living thing we saw, and the only sound was the unnatural bluster of our steam engine. The wild defile that leads to the excavated city of Petra is not more noiseless or more extraordinary, but strangely contrasting in its sterile desolation, while here all is luxuriant, romantic, and beautiful.

"For nine miles the passage continued thus one scene of unvarying beauty, when suddenly the narrow river expanded into a large lake, encompassed by mountains, and studded with islands, which the setting sun illuminated with gorgeous splendour. We remained on deck till a late hour, and awoke the next morning in the harbour of Yzabal. A single schooner of about forty tons, showed the low state of her commerce. We landed before seven o'clock in the morning, and even then it was hot. There were no idlers on the bank, and the custom-house officer was the only person to receive us.

The town of Yzabel stands on the gentle sloping banks of the Golfo Dulce, with high mountains rising in the background. A street runs from the water to a sort of square: with the exception of two or three wooden-framed houses, the other habitations were huts. Under a large shed were bales of merchandise mules, muleteers, and Indians, for carrying merchandise across the Mico Mountain.

The arrival of the priest was announced by ringing the church bells, and, in his canonicals, he soon proceeded to the church and celebrated mass. In front of the church was planted a large wooden cross. The floor was hard earth covered with leaves; the walls were decorated with branches and flowers; on the altar were the Virgin and some saints. For a considerable time mass had not been performed, and Spaniards, Mestitzoes, and Indians, thronged to the devotion.

SAN JUAN DEL NORTE, in Nicaragua, 11 deg. N. latitude, and 83 deg. 48 min. W. long., situated on the western mouth of the Rio de San Juan, has a good harbour, very little frequented, and with few inhabitants. Hides and some Indigo are brought down the River San Juan from the country and towns round the Lake of Nicaragua, of which see account of the Harbour and River San Juan, included in the description hereafter of the isthmus of Nicaragua and of Panama.

OMOA is situated on a small bay, forming a good harbour, by which most of the European goods destined for Guatemala and St. Salvador are imported. It is an unhealthy place, and chiefly inhabited by a few mulattoes.

The inland towns of COMAYAGUA and TEGUCIGALPA are situated in the province of Honduras, in which is also situated TRUXILLO, an open bay, with anchorage in a roadstead. Mahogany is cut in the neighbourhood, and is almost the only article of export. The town, with the adjacent hamlets, contains about 4000 inhabitants.

NEW GUATEMALA, the capital of the state, is situated on an undulating plain, 4961 feet above the sea. In the *tierra templada*, or temperate region, the climate is very much like that of Italy, but not so cold in winter. The houses, constructed with the apprehension of earthquakes, though capacious, are only one story high, with thick walls, and with gardens attached. The streets are broad, straight, cross each other at right angles, and are partly paved. The public buildings are, a university, five convents, four nunneries, a cathedral, and about twenty churches, the treasury, the mint, and other government offices: most of them exhibit a secular style of architecture. The great hospital, called San Juan de Dios, can receive 400 patients. Water is brought, by an aqueduct, from a spring about five miles from the town, and conducted into twelve public reservoirs, from which it is distributed to the private houses. The population of New Guatemala, including some adjacent places, is estimated at above 40,000 souls.

The Plaza is a square of 150 yards on each side, paved, and with a colonnade along three sides: on one of the sides stands the old vice-regal palace and hall of the audiencia; on another are the Cabildo and some other state buildings. On the third side stands the custom-house and palace of the *ci-devant* Marquisate of Aycinena. The fourth side is occupied by the cathedral, a superb edifice, with the archbishop's palace on one side, and a college on the other. In the centre there is a large stone fountain. A market is held in the Plaza.

The houses of New Guatemala, though low, cover an extensive surface. The house occupied by the American chargé d'affaires, Mr. De Witt, is described as on the same plan as that of the houses generally, the entrance of which is by a large double door, then through a passage paved with small black and white stones, into a patio or court paved in like manner, around the sides of which are

wide corridors, paved with square red bricks. These corridors are bordered with various flowers. In front, facing the street, and adjoining the entrance, there is an ante-room having a large window with a balcony; then a *sala*, with two windows. A door opens from this room into the *comedor* or *salle à manger*. This is the dining-room, and has two windows facing the corridor: adjoining this room there is a bed-room, and then another bed-room with doors and windows also facing the corridor. In the centre and fronting the back part of the court are rooms for servants, and in the corners of the building a kitchen and stable are concealed. The plan of all the houses in Guatemala is the same; others are much larger; that of the Aycinena family, for example, covered a square of 200 feet long on each side.

The city of Guatemala is renowned for its religious observances. At matins and vespers the churches are all open, and the inhabitants—especially all the women—are constant in their devotions. Each house has its image of the Virgin, the Saviour, or some saint.

The processions in honour of the Virgin, and other religious processions, are frequent. All the streets through which the processions pass are strewn with pine leaves, and adorned with arches decorated with evergreens and flowers. From the long balconies and windows are displayed curtains of crimson silk and flags with various devices. At the corners are erected altars, within huge arbours of evergreens, and on these altars pictures and silver ornaments, borrowed from the churches, are conspicuous, and surmounted with flowers. The plain, or the valley of Guatemala is pre-eminent for the variety and brilliancy of its floral kingdom. These flowers are in profusion devoted to the embellishment of the religious processions.

Of the surrounding country, and the cities of New and Old Guatemala, Mr. Stephens says—

“Late in the afternoon, as I was ascending a small eminence, two immense volcanoes stood up before me, seeming to scorn the earth and towering to the heavens. They were the great volcanoes of Agua and Fuego, forty miles distant, and nearly fifteen thousand feet high, wonderfully grand and beautiful. In a few moments the great plain of Guatemala appeared in view, surrounded by mountains, and in the centre of it the city, a mere speck on the vast expanse, with churches, and convents, and numerous turrets, cupolas, and steeples, and still as if the spirit of peace rested upon it, with no storied associations, but by its own beauty creating an impression on the mind of the traveller which can never be effaced. I dismounted and tied up my mule. As yet the sun lighted up the roofs and domes of the city, giving a reflection so dazzling that I could only look at them by stealth. By degrees its disc touched the top of the Volcano del Agua; slowly the whole orb sank behind it, illuminating the background with an atmosphere fiery red. A rich golden cloud rolled up its side and rested on the top, and while I gazed the golden hues disappeared, and the glory of the scene was gone.

“As yet I did not know where to stop; there was no hotel in Guatemala!”

Old Guatemala (La Antigua) is situated in a narrow valley between the two volcanoes called Del Agua (*of water*) and Del Fuego (*of fire*), 5817 feet above the sea. It was the capital of the country until 1773, when it was destroyed by

repeated earthquakes. New Guatemala was founded in 1776, and the seat of government transferred to it. A considerable number of inhabitants, however, remained at Old Guatemala, the population of which is now said to exceed 15,000. Their attachment to this town is so remarkable that the inhabitants are called "*The Incurables*." A great part of the town is filled with ruins, but it still contains some large buildings. It has also some rude cotton-manufactories. Few places in the world are more picturesque than the country about Old Guatemala. The volcano del Agua is 12,620 feet above the sea, and the volcano del Fuego still higher. The first vomits water, the second fire.

Mr. Stephens says of this city—

"On each side were the ruins of churches, convents, and private residences, large and costly, some lying in masses, some with fronts still standing, richly ornamented with stucco, cracked and yawning, roofless, without doors or windows, and trees growing inside above the walls. Many of the houses have been repaired, the city is partly re-peopled, and presents a strange appearance of ruin and recovery. The inhabitants, like the dwellers over the buried Herculaneum, seemed to entertain no fears of renewed disaster. The great volcanoes of Agua and Fuego look down upon it. In the centre of the Plaza there is a large stone fountain, and it is surrounded by magnificent buildings. The former palace of the captain-general, displaying the armorial bearings granted by the Emperor Charles V., to 'the loyal and noble city,' and surmounted by a statue of St. James on horseback, armed and brandishing a sword, and the roofless and dilapidated cathedral, a vast edifice, 300 feet long, 120 broad, nearly seventy high, and lighted by fifty windows, are monuments which tell us that *La Antigua* was one of the most superb cities of America, and to which Alvarado gave the name of '*the City of St. James of Gentlemen*.'"

About four o'clock in the afternoon of the 29th of July, 1773, the foundations of the city began to tremble, and in a few minutes a most terrible earthquake damaged a great portion of the city. On the 7th of September following, another laid prostrate most of the buildings which were previously disturbed, and on the 13th of December, the ancient city of Guatemala was, by a tremendous earthquake, rendered uninhabitable.

TOTONICAPAN is estimated to contain 12,000 inhabitants, nearly all aborigines; they manufacture some earthenware, wooden utensils, woollen cloths, and a few other articles.

QUEZALTENANGO has an estimated population of about 14,000 inhabitants, with some woollen and cotton manufactures. In its neighbourhood is a volcano and a hot spring, the waters of which are thrown out forming a *jet d'eau*, rising to the height of twenty or thirty feet.

Of this town Mr. Stephens says,—

"As we approached Quezaltenango seven towering churches showed that the religion so hastily adopted had not died away. In a few minutes we entered the city. The streets were handsomely paved, and the houses picturesque in architecture; the Cabildo had two stories and a corridor. The cathedral, with its façade richly decorated, was grand and imposing. The Plaza was paved with stone, having a fine fountain in the centre, and commanding a magnificent view of the volcano and mountains around."

COBAN, the capital of Vera Paz, is situated in an undulating and luxuriant

valley, and is supposed to contain about 14,000 inhabitants, nearly all of whom are aborigines; and said to be much more wealthy and orderly than in any other part of the country. The valley is described as exceedingly fertile, and covered with plantations of sugar-cane, bananas, pimento-trees, and various kinds of fruit-trees.

SALAMA contains about 5000 inhabitants, is situated on the road between Guatemala and the Embarcadero de Telemanon the Polochic.

GUALAN, on the Rio Motagua, is the place where the goods which ascend the river are unladen, and those intended for exportation are laden.

Of the country around Gualan, Mr. Stephens says—

“They next day travelled for some distance along the banks of the Motagua, almost as beautiful by morning as by evening light. The scenery was grand, but the land wild and uncultivated, without fences, enclosures, or habitations—a few cattle were wandering wild over the great expanse. We met a few Indians with their machees, going to their morning’s work, and a man riding a mule, with a woman before him, his arm encircling her waist.

“For an hour longer we continued on the ridge of the mountain, then entered a more woody country, and in half an hour came to a large gate, which stood directly across the road like a toll-bar. It was the first token we had seen of individual or territorial boundary, and in other countries would have formed a fitting entrance to a princely estate; for the massive frame, with all its posts and supporters, was of solid mahogany. The heat was now intense. We emerged into an open plain, on which the sun beat with almost intolerable power; and crossing the plain at about three o’clock, entered Gualan. There was not a breath of air; the houses and the earth seemed to throw out heat.

“Towards evening we strolled through the town. It stands upon a table of breccia rock, at the junction of two noble rivers, and is encircled by a belt of mountains. One principal street, the houses of one story, with piazzas in front, terminates in a plaza or public square, at the head of which stands a large church with a Gothic door; and before it, at a distance of ten or twelve yards, was a cross about twenty feet high. The population is about 10,000, chiefly Mestizoes. Leaving the plaza, we walked down to the Motagua, on the bank a boat was in process of construction, about fifty feet long and ten wide, entirely of mahogany. Near to it a party of men and women were fording the stream, carrying their clothes above their heads, and around a point three women were bathing. There are no ancient associations connected with this place, but the wildness of the scene, the clouds, the tints of the sky, and the setting sun reflected upon the mountains were beautiful. At dark we returned to the house. Except for the companionship of some thousands of ants, which blackened the candles, and covered every thing perishable, we had a room to ourselves. Early in the morning we were served with chocolate and a small roll of sweet bread. Toward evening the whole town was in commotion, preparatory to the great fête of Santa Lucia. Early next morning, the firing of muskets, petards, and rockets, announced the arrival of this lady, one of the holiest saints of the calendar, and, next to San Antonio, the most renowned for working miracles.”

TORTILLAS.—On entering another house, he found “the whole family engaged in making tortillas. This is the bread of Central and of all Spanish America, and the only species to be found except in the principal towns. At one end of the *cucinera* was an elevation, on which stood a comal, or griddle, resting on three stones, with a fire blazing under it. The daughter-in-law had before her an earthen vessel containing Indian corn soaked in lime-water to remove the husk, and placing a handful on an oblong stone, curving inward, mashed it with a stone roller into a thick paste. The girls took it as it was mashed, and patting it with their hands into flat cakes, laid them on the griddle to bake. This is repeated for every meal, and a great part of the business of the women consists in making tortillas.

REALEJO, on the Pacific, is capacious, has safe anchorage, and exports the

produce of the country, chiefly mahogany, cedar, and Nicaragua-wood, to Peru, Chile, &c. The harbour, according to Juarros, is capable of containing 1000 ships. The village at this port has two or three streets, with low straggling houses, behind which there is a forest. It was founded by a few of the companions of Alvarado. Afterwards its situation near the sea exposed it to the devastations of the old buccaneers; and in consequence, the inhabitants retired to the interior, and built Leon.

LEON is the capital of the state of Nicaragua; it was formerly a place of importance, with a population of 32,000 souls; but has been since greatly reduced by anarchy and other distracting circumstances. It is situated on a plain about forty miles from Realejo, ten from the sea, and fifteen from the Lake of Managua. It has a university, cathedral, and eight large churches, and other public institutions. It carries on some trade through Realejo. The houses are described by Mr. Roberts as very similar to those of Guatemala, none being above two stories high. The population in 1820 was about 14,000.

Plain of Leon.—This plain is bounded on the Pacific side by a low ridge, and on the right by high mountains, part of the chain of the Cordilleras. Mr. Stephens says:—

“Before us at a great distance, rising above the level of the plain, we saw the spires of the Cathedral of Leon. This magnificent plain, in richness of soil is not surpassed by any land in the world, lay as desolate as when the Spaniards first traversed it. The dry season was near its close; for four months there had been no rain, and the dust hung around us in thick clouds, hot and fine as the sands of Egypt. Leon had an appearance of old and aristocratic respectability, which no other city in Central America possessed. The houses were large, and many of the fronts were full of stucco ornaments; the plaza was spacious, and the squares of the churches and the churches themselves magnificent. It was under Spain, a bishop’s see, and distinguished for the costliness of its churches and convents, its seats of learning, and its men of science, to the time of its revolution.

“In walking through its streets,” observes Mr. Stephens, “I saw palaces in which nobles had lived dismantled and roofless, and occupied by half-starved wretches, pictures of misery and want, and on one side an immense field of ruins covering half the city. I must confess that I felt a degree of uneasiness in walking the streets of Leon that I never felt in any city in the East. My change of dress did not make my presence more acceptable, and the eagle on my hat attracted particular attention. At every corner was a group of scoundrels, who stared at me as if disposed to pick a quarrel. With some my official character made me an object of suspicion, for in their disgraceful fights they thought that the eyes of the whole world were upon them, and that England, France, and the United States were secretly contending for the possession of their interesting country.”

SEBA is a small port on the Bay of Conchagua, by which the produce of the mines of Tabanco used to be exported.

VALLADOLID DE COMAYAGUA, the capital of the state of Honduras, is situated nearly in its centre, between two rivers, in a fine valley, with about 3000 inhabitants. It has the reputation of being an unhealthy place.

TEGUCIGALPA is situated on the high table-land of Honduras, estimated population 8000 to 10,000 inhabitants. In its neighbourhood are mines of gold, silver, copper, and iron.

The harbour of **CONCHAGUA**, situated on the gulf of the same name, is a safe port. Between the Gulf of Conchagua and the port of Acapulco there is no good harbour on the coast of the Pacific, and trading vessels are obliged to anchor in open roadsteads. The roadstead of Libertad is the place goods destined for St. Salvador are unladen,—that of Acajutla is the port of Sonzonate.

ST. SALVADOR, of the Federal District, contains above 16,000 inhabitants. They are said to be industrious, and manufacture iron and cotton. It is situated near a stream, between hills. The Federal District lies around the town in a circle, with a radius of about eleven miles, except towards the Pacific, where it extends to the roadstead of Libertad, about twenty-six miles distant. The volcano of St. Salvador is within the Federal District.

ST. VICENTE, contains about 8000 inhabitants. In its neighbourhood are plantations of indigo and tobacco, the latter on the declivity of the volcano of St. Vicente.

ST. MIGUEL, said to have a population of 8000 inhabitants, is noted for its fairs, the most important of which is held in the month of November, after the indigo crop—that article being raised in great quantities in its neighbourhood. The town is considered unhealthy.

SACATECOLUCA is situated in the low country which borders the Pacific, with 8000 inhabitants. A considerable quantity of indigo is raised in the neighbourhood.

SONZONATE, situated on the banks of the Rio Grande, about twelve miles from the roadstead of Acajutla, is estimated as having about 10,000 inhabitants, who make and export fancy shell-work. The surrounding country is one of the richest districts of the state of St. Salvador. From the Plaza the streets cross at right angles. The houses are only one story high, but generally large. The best houses are deserted in consequence of anarchy having driven their owners into exile. For the seven superb churches there was lately but one priest. In its neighbourhood sugar is grown for home consumption, and some is also exported to Peru from Acajutla. The volcano of Izalco is in the neighbourhood.

AGUACHAPA has a population estimated at 8000 inhabitants. Sugar is cultivated near it.

SANTA ANNA, estimated population, 10,000 inhabitants. There are plantations of indigo and sugar-canes in the neighbourhood. The best sugar in the country is made here, and in the adjacent mountains iron-mines are worked.

METAPA, near the Lake of Metapa, estimated population 8000 inhabitants. There are iron-mines in the neighbourhood.

MANAGUA, near Lake Managua, has about 13,000 inhabitants, chiefly whites.

MASAYA, a neatly-built town, near the Lake of Nicaragua, is stated to have a population of about 13,000 inhabitants, chiefly Indians, who trade in the produce of the country and other articles.

GRANADA, with about 14,000 inhabitants, is situated on the borders of the Lake of Nicaragua. It is the principal place from which the produce of the country is sent to the harbour, of San Juan del Norte, by the craft which navigate the lake and river.

NICARAGUA, about three miles from the lake, is said to contain from 10,000 to 12,000 inhabitants, and, with the district of St. George, from 20,000 to 22,000. It is situated in a fertile district, where great quantities of cacao are raised.

On the table-land of Nicaragua, is the little town of New Segovia, in the neighbourhood of which excellent tobacco is grown.

COMITAN, the frontier town of Chiapas, contains a population of about ten thousand. The landed proprietors of the surrounding country, as in other parts of Central America, have houses in this town and visit their haciendas occasionally. Comitán is notorious for its smuggling trade. Most of the European goods used in this part of Central America are smuggled in from Belize and Guatemala.

With regard to the population of any of the towns of Central America we consider the foregoing estimates as exceedingly vague.

CHAPTER III.

ROUTE OVER THE MOUNTAINS FROM THE GULF OF DULCE TO GUATEMALA.

ALTHOUGH Central America has been traversed and possessed, since the year 1513, that is 333 years, by the Spanish-European race, the route from the eastern to the western coast, may be considered as one disgraceful to the most barbarous of nations.

The route from the Golfo Dulce on the east to the city of Guatemala near the western shores of America has been passed over for more than two hundred years, yet no road, properly speaking, has been constructed for carriages; and goods, provisions, and not unfrequently travellers, continue to be carried on men's shoulders, or on the backs of animals.

All descriptions that we have read, or heard, of the interior means of communication agree in denouncing the badness, or rather the absence of roads. The journey of Mr. Stephens from the Golfo Dulce fully confirms these statements. He tells us that:—

“At daylight the muleteers commenced loading for the passage of the ‘mountain:’ at seven o’clock the whole caravan, consisting of nearly one hundred mules and twenty or thirty muleteers, was fairly under way. Our immediate party consisted of five mules—two for Mr. Catherwood and myself, one for Augustin, and two for luggage; besides which we had *four Indian carriers*. A padre was carried on the back of an Indian who was relieved when exhausted by another Indian.

“Passing a few straggling houses, which constituted the suburbs of the town, we

entered upon a marshy plain sprinkled with shrubs and small trees, and in a few minutes were in an unbroken forest. At every step the mules sank to their fetlocks in mud, and very soon we came to great puddles and mudholes, which reminded me of the breaking up of winter, and the solitary horsepath in one of our primeval forests at home. As we advanced, the shade of the trees became thicker, the holes larger and deeper, and roots rising two or three feet above the ground crossed the path in every direction. I gave the barometer to the muleteer, and had as much as I could do to keep myself in the saddle. All conversation was at an end, and we kept as close as we could to the track of the muleteer; when he descended into a mudhole and crawled out, the entire legs of the mule were blue with mud, we followed, and came out as blue as he.

"The caravan of mules, which had started before us, was but a short distance ahead, and in a little while we heard ringing through the woods the loud shout of the muleteers and the sharp crack of the whip. We overtook them at the bank of a stream which broke rapidly over a stony bed. The whole caravan was moving up the bed of the stream; the water was darkened by the shade of the overhanging trees; the muleteers without shirts, and with their large trousers rolled up to the thighs and down from the waistband, were scattered among the mules: one was chasing a stray beast; a second darting at one whose load was slipping off; a third lifting up one that had fallen; another, with his foot braced against a mule's side, straining at the girth; all shouting, cursing, and lashing: the whole a mass of inextricable confusion, and presenting a scene almost terrific.

"The branches of the trees met over our heads, and the bed of the stream was so broken and stony that the mules constantly stumbled and fell.

"The ascent began precipitously, and by an extraordinary passage. It was a narrow gulley, worn by the tracks of mules and the washing of mountain torrents so deep that the sides were higher than our heads, and so narrow that we could barely pass through without touching. Our whole caravan moved singly through these muddy defiles, the muleteers scattered among them and on the bank above, extricating the mules as they stuck fast, raising them as they fell, arranging their cargoes, cursing, shouting, and lashing them on. If one stopped, all behind were blocked up, unable to turn. Any sudden start pressed us against the sides of the gulley, and there was no small danger of getting a leg crushed. Emerging from this defile, we came again among deep mudholes and projecting roots of trees, with the additional difficulty of a steep ascent. The trees, too, were larger, and their roots higher and extending farther; and above all, the mahogany-tree threw out its giant roots, high at the trunk and tapering, not round like the roots of other trees, but straight, with sharp edges, traversing rocks and the roots of other trees.

"It was the last of the rainy season; the heavy rains from which we had suffered at sea had deluged the mountains; and it was in the worst state to be passable, for sometimes it is not passable at all. For the last few days there had been no rain; but we had hardly congratulated ourselves upon our good fortune in having a clear day, when the forest became darker and the rain poured. The woods were of impenetrable thickness; and there was no view except that of the detestable path before us. For five long hours we were dragged through mudholes, squeezed in gulleys, knocked against trees, and tumbled over roots; every step required care and great physical exertion; and above all, I felt that our inglorious epitaph might be—'tossed over the head of a mule, brained by the trunk of a mahogany-tree, and buried in the mud of the Mico Mountain.' We attempted to walk, but the rocks and roots were so slippery, the mudholes so deep, and the ascents and descents so steep, that it was impossible to continue. The mules were only half loaded, and even then several broke down—the lash could not move them, and scarcely one passed over without a fall.

"The descent was as bad as the ascent; and instead of stopping to let the mules breathe, as they had done on ascending, the muleteers seemed anxious to determine in how short a time they could tumble them down the mountain. In one of the muddiest defiles we were shut up by the falling of a mule before, and the crowding upon us of all behind; and at the first convenient place we stopped until the whole caravan had passed.

This is the great high road to the city of Guatemala, which has always been a place of distinction in Spanish America. Almost all the travel and merchandise from Europe passes over it ; and our guide said, the reason it was so bad was because it was traversed by so many mules. In some countries this would be a reason for making it better ; but it was pleasant to find that the people to whom I was accredited, were relieved from one of the sources of contention at home, and did not trouble themselves with the complicated questions attendant upon internal improvements.*

"In two hours we reached a wild river or mountain torrent, foaming and breaking over its rocky bed, and shaded by large trees. It was called *El Arroyo del Muerto*, or Stream of the Dead.

"With ten hours of the hardest riding I ever went through, we had only made twelve miles."

He then travelled onward, and reached a beautiful table-land, where he met an encampment of muleteers on their way to Yzabel. Bales of indigo, which formed their cargoes, were piled up like a wall around them ; their mules were browsing near them, and they had lighted fires to cook their suppers.

He descended with the caravan from the table-land to a plain thickly wooded, and then through a grove of beautiful wild palm trees. He observes,—

"From the top of a tall naked stem grew branches twenty or thirty feet long, spreading from the trunk, and falling outward with a graceful bend, like enormous plumes of feathers, the trees stood so close that the bending branches met, and formed arches in some parts as regular as if constructed by art."

Before dark he reached the rancho of Micho, a small house constructed of poles, plastered together with mud, a larger house connected by a shed, thatched with branches for the express use of travellers. Here they hung their hammocks and slept. There were groups of muleteers bivouacked on the ground.

Next day the route was over a mountainous country, with little wood. When he reached the rancho of *El Pozo* they began to find that a scarcity of food was to be endured.

From *El Pozo*, they travelled along the ridge of a high mountain, which was ornamented with pine-trees, green hill sides, and cattle grazing on them. In the evening they descended by wild and difficult paths to the River *Motagua*, which was rolling majestically down a great deep valley. High mountains arose on each side, and before and behind. With some difficulty they crossed this river in a canoe, and the mules were by beating made to swim over. At the rancho they could get nothing to eat. Fatigued and heated, the travellers bathed in the *Motagua*. Men, women, and children at this place were almost naked. They next day proceeded up along the banks of the river, and then up the spur of a mountain. The country was wild, uncultivated, and uninhabited. At length they arrived at an Indian rancho, where they procured hot tortillas ; after which they travelled on, passing through thick woods, forded a wild stream, in company with a drove of pigs, reached a cochineal plantation, and, crossing an open plain, reached *Gualan*, where they found accommodation and food.

* Since that time the constituent assembly of Guatemala has imposed a tax of one dollar upon every bale of merchandise that passes over the mountain, for the improvement of the road.

From Gualan up to San Pablo on the south side of the Motagua River, the country exhibits great beauty and natural luxuriance; the path ascends over a mountain, then descends to the river, and then ascends to San Pablo, whence it descends to the Plain of Zacapa—crossing which, and fording a stream, the route ascends to Zacapa—a town with a huge church. From this place to Chimalapa the road is more level; and thence to the town of Guasloya the country is remarkably picturesque. The latter town stands overlooking a fertile valley in which are large *milfras*, or maize-fields. The route then passes through a wild ravine. Another long steep ascent leads over heights to the village of El Puerta, beyond which, after crossing a bridge over a torrent, another mountain-range is crossed commanding splendid views, and, on descending, an uncultivated country prevails to the cattle hacienda of San José. From this place the path leads over a table-land to an eminence, on the top of which the great Plain of Guatemala and the volcanoes of Agua and Fuego burst into the magnificent landscape. On the other side of this height there is a vast ravine to pass, beyond which the traveller enters the city of Guatemala.

CHAPTER IV.

MISCELLANEOUS SKETCHES OF CENTRAL AMERICA.

WE find no complete description of Central America. Juarras, although born and brought up in the country, says almost nothing of the eastern coast, or of the Mosquito Shore. It is remarkable that some of the most accurate descriptions of some parts of Central America, especially of the Rio Vankes or Segovia, are found in the journals of the old buccaneers. Of recent travellers, Mr. Stephens alone has best described the routes along which he travelled, and the places, things, and people which he saw. Juarras, in some of his descriptions of the Province and Lake of Nicaragua, is inaccurate from evident ignorance. Some of Dampier's descriptions are still accurate.

Central America is a country of such great extent, varied configuration, luxuriant fertility, and abundant natural resources, that, with the advantages of its many excellent harbours, and of its geographical position, it must become one of the most important in America, in connexion with the maritime and commercial spirit of the age, and with the events that have occurred, and those now in progress, towards inevitably great changes in the condition of Mexico and of this region. Central America cannot remain much longer an unproductive and barbarous country. We may at present apply to its rulers and possessors the remark made by Montesquieu on Constantinople, the condition of which he ascribed to "God permitting that Turks should exist on the earth; a people the most fit to possess uselessly a great empire."

To complete the best account we can of this country, we have condensed

the following miscellaneous sketches, and those in the succeeding chapters, from the accounts of Dupais, Kingsborough, Roberts, Waldeck, Del Rio, Captain Belcher, Baily, Rouchaud, Dumatry, also from a work on Mexico and Guatemala published in Boston, and those subsequently of Mr. Stephens. The localities of the places described will be more easily discovered by a reference to the best modern maps of Central America.

On the party, with which Mr. Stephens travelled, leaving Gualan, the Motagua River flowed down on the right, and beyond it rose the mountains of Vera Paz, 6000 to 8000 feet high. They ascended amidst flowers, shrubs, and bushes decked in purple and red; and "on the sides of the mountain and in the ravines leading down to the river, in the wildest positions, were large trees so covered with red that they seemed a single flower."

As they descended, the river was rolling swiftly, and in some places breaking into rapids. They reached the village of San Pablo, "situated on a lofty table-land, looking down upon the river and having its view bounded by the mountains of Vera Paz." The church stood at the entrance of the village. They turned the mules loose to graze, and took their meals in the porch. It was a beautiful position, and two waterfalls shone like streaks of silver on the distant mountain-side.

At Zacapa, they saw, for the first time, a school-house. It was a respectable-looking building, with columns in front, and against the wall hung a large card, headed,

"1st Decurion (a student who has the care of ten other students), 2nd Decurion, monitor, &c.

"Interior regulation for the good government of the School of First Letters of this town, which ought to be observed strictly by all the boys composing it, &c."

With a long list of complicated articles declaring the "rewards and punishments."

The school, for the government of which these regulations were intended, consisted of five boys, two besides the decurions and monitor. It was nearly noon, and the master, who was the clerk of the alcalde, had not made his appearance. The only books were a Catholic prayer-book, and a translation of Montesquieu's "Spirit of Laws."

In an hour afterwards they forded the Motagua, still a broad, deep, and rapid stream. They then entered on the plain of Zacapa, cultivated for corn and cochineal, and divided by fences of brush and cactus. Beyond this the country became broken, arid, and barren. Soon after, they commenced ascending a steep mountain, and in two hours reached the top, 3000 or 4000 feet high, and looking back, had a fine view of the plain and town of Zacapa. He says,

"Crossing the ridge, we reached a bold precipitous spur, and very soon saw before us another extensive plain, and afar off, the town of Chiquimula, with its giant church. On each side were immense ravines, and the opposite heights were covered with pale and rose-coloured mimosa. We descended by a long and zigzag path, and reached the plain, on which were growing corn, cochineal, and plantain. Once more fording a

stream, we ascended a bank, and at two o'clock entered Chiquimula, the head of the department of that name."

In the centre of the plaza a fountain, shaded by palm-trees, was surrounded by women filling their water-jars. Facing the Plaza were the church and cabildo.

"On one corner," says Mr. Stephens, "was a house, to which we were attracted by the appearance of a woman at the door. I may call her a lady, for she wore a frock not open behind, and shoes and stockings, and had a face of uncommon interest, dark, and with finely-pencilled eyebrows. To heighten the effect of her appearance she gave us a gracious welcome to her house, and in a few minutes the shed was lumbered with our multifarious luggage."

The number of ruined churches in Central America is remarkable, as bearing on the declining condition of the country. Many of the churches, and even of the old Spanish towns, seem destined to be overgrown with forest trees in the same manner as Dupais, Waldeck, and Stephens have found the ruined temples of Central America and Yucatan.

Walking down to the edge of the table of land, Mr. Stephens saw what had attracted his attention at a great distance—a large church in ruins. It was seventy-five feet in front, and two hundred and fifty feet in depth, and the walls were ten feet thick. The façade was adorned with ornaments and figures of saints larger than life. The roof had fallen. The inside was filled with masses of stone and mortar, and a thick growth of trees.

"It was built by the Spaniards on the site of the old Indian village, but having been twice shattered by earthquakes, the inhabitants had deserted, and built the town where it now stands. The ruined village was now occupied as a campo santo or burial-place; inside the church were the graves of the principal inhabitants, and in the niches of the wall were the bones of priests and monks, with their names written under them. Outside were the graves of the common people, untended and uncared for, with the barrow of laced sticks which had carried the body to the grave laid upon the top, and slightly covered with earth. The bodies had decayed, the dirt fallen in, and the graves were yawning. Around this scene of desolation and death, nature was rioting in beauty; the ground was covered with flowers, and parrots on every bush and tree, and flying in flocks over our heads, wanton in gaiety of colours, with senseless chattering disturbed the stillness of the grave."

On returning to the town he found about twelve hundred soldiers, of ferocious and banditti like character, parading in the plaza.

"Convicts were peeping through the gratings of the prison, and walking in chains on the plaza. Officers were mounted on prancing mules or very small horses, almost hidden in saddle-cloth and armour.

In the village of San Estevan, on the route to the ruins of Copan, amid a miserable collection of thatched huts, stood a gigantic church, like that at Chiquimula, in ruins. This district had a little before been scourged by civil war.

From the top of the mountain, where he had, at a great distance, a view of the town of Chiquimula, he beheld rising above a few thatched huts, another gigantic and roofless church. On heights apparently inaccessible, the wild hut of the Indian appeared, with his milpa or patch of Indian corn.

"Clouds gathered around the mountains, and for an hour we rode in the rain; when

the sun broke through, we saw the mountain tops still towering above us, and on our right far below us, a deep valley. We descended, and found it narrower and more beautiful than any we had yet seen, bounded by ranges of mountains several thousand feet high, and having on its left a range of extraordinary beauty, with a red soil of sandstone, without any brush of underwood, and covered with gigantic pines. In front, rising above the miserable huts of the village, and seeming to bestride the valley, was the gigantic church of St. John the Hermit, reminding me of the church of St. John in the Wilderness of Judea, but the situation was even more beautiful. At four o'clock we saw, on a high table on the left, the village of Jocotan, with another gigantic church.

"At six o'clock we rose upon a beautiful table land, on which stood another gigantic church. It was the seventh we had seen that day, and coming upon them in a region of desolation, and by mountain paths which human hands had never attempted to improve, their colossal grandeur and costliness were startling, and gave evidence of a *retrograding and expiring people*. This stood in a more desolate place than any we had yet seen. The grass was green, the sod unbroken even by a mule path, not a human being was in sight, and even the gratings of the prison had no one looking through them."

A Hacienda.—The hacienda of San Antonio was situated in a wildly beautiful country. It consisted of a clearing for a cow-yard and a milpa, or plantation, of maize; tobacco and plantains were also cultivated.

"The house," says Mr. Stephens, "was built of poles plastered with mud, and against the wall, in front of the door, was a figure of the Saviour on the cross, on a white cotton cloth, hung round with votive offerings. A naked child, which the mother carried in her arms, was called Maria de los Angeles. While supper was in preparation, the master of the house arrived, a swarthy grim-looking fellow, with a broad-brimmed sombrero and huge whiskers, and mounted on a powerful young horse, which he was just breaking to the mountain roads; when he knew that we were strangers asking hospitality, his harsh features relaxed, and he repeated the welcome the woman had given us.

"They asked us about our wives, and we learned that our simple-minded host had two, one of them lived at Hocotan, and that he passed a week alternately with each. He assisted us in swinging our hammocks, and about nine o'clock we drove out the dogs and pigs, lighted cigars, and went to bed. Including servants, women, and children, we numbered eleven in the room. All around were little balls of fire, shining and disappearing with the puffs of the cigars. One by one these went out, and we fell asleep.

A Thunder-storm.—"The road lay through a thick forest: very soon the clouds became blacker than ever. On the left was a range of naked mountains,—the old stone quarries of Copan, along which the thunder rolled fearfully, and the lightning wrote angry inscriptions on its sides. An English tourist in the United States admits the superiority of our thunder and lightning. I am pertinacious on all points of national honour, but concede this in favour of the tropics. The rain fell as if flood-gates were opened from above; and while my mule was slipping and sliding through the mud I lost my road."

The River Copan.—Mr. Stephens says, the Guadalquiver cannot be more beautiful than this river.

Ascending an eminence afterwards, he saw a large field with stone fences and bars, and cattle-yard. It seemed to resemble a Westchester farm in new England. He entered by a gate, and rode up through a fine park to a long, low, substantial-looking *hacienda*. It belonged to a Don Clementino.

"The family consisted of a widow with a large family of children, the principal of whom was Don Clementino a young man of twenty-one, and a sister of about sixteen or seventeen, a beautiful fair-haired girl."

There was at the time, a party of young people in holiday dresses, mules with fanciful saddles, were tied to the post of the piazza. The Don was dressed in white jacket and trousers, braided and embroidered, white-cotton cap, covered by a *steeple-crowned* glazed hat, with a silver cord as a band, and a silver ball with a pointed bit of steel as a cockade, and red and yellow stripes under the brim. This young Don was the *beau ideal* of impudence and ignorance. After asking very silly questions of Mr. Stephens, he picked up a guitar, danced off to his own music, and sat down on the earthen floor of the piazza to play cards.

Preparations were, at the same time, going on for a wedding, to be celebrated at a house two leagues distant, a little before dark.

The young men and girls were dressed for the visit. All were mounted, and, "for the first time," says Mr. Stephens, "I admired exceedingly the fashion of the country in riding. My admiration was called forth by the sister of Don Clementino and the happy young gallant who accompanied her. Both rode the same mule, and on the same saddle. She sat sideways before him; his right arm encircled her waist; at starting the mule was restive, and he was obliged, from necessity, to support her in her seat, to draw her close to himself; her ear invited a whisper, and when she turned her face towards him her lips almost touched his."

Don Clementino had "a fine mule gaily caparisoned, swung a large basket-hilted sword through a strap in the saddle, buckled on a pair of enormous spurs, and mounting, wound his *poucha* around his waist, so that the hilt of the sword appeared about six inches above it; giving the animal a sharp thrust with his spurs, he drove her up the steps, through the piazza, and down the other side, he started to overtake the others."

The supper consisted of fried beans, fried eggs, and tortillas. The beans and eggs were served on heavy silver dishes, and the tortillas were laid in a pile by his side. There were no plate, knife, fork, or spoon.

Mr. Stephens slept in an outbuilding constructed of small poles and thatched, and for the whole paid eighteen cents and three-quarters. He gave a pair of earrings to a woman whom he supposed to be a servant, but whom he found was only a visiter. At this, though a private residence, he paid as almost everywhere else, for every thing.

The Don afterwards persuaded Mr. Stephens to buy his mule, and mounted on which he ascended the great Sierra, which divides the streams running into the Atlantic from those that flow into the Pacific Ocean. The scenery was wild and grand, but it rained heavily. When descending, the clouds cleared off, and an almost boundless plain opened to view, extending from the foot of the sierra; afar off, standing alone in the wilderness, rose the great church Esquipulas.

On entering the town in the evening, he rode up to the convent.

"The whole household of the cura, turned out to assist, and in a few minutes the mules were munching corn in the yard, while I was installed in the seat of honour in the convent. It was by far the largest and best building in the place.

This cura was a young delicate man under thirty. He was dressed in a long, black bombazet robe, drawn tight around the neck, with a cross and rosary suspended. His name was Jesus Maria Gutierrez.

The matin bell called the people to mass. Groups of Indian women knelt

around the altar, with white mantillas flowing down from over their heads, and without shoes or stockings.

Here is the great church of the pilgrimage, the holy place of Central America. Every year, on the 15th of January, pilgrims visit it. They come even from Peru and Mexico; the latter being a journey not exceeded in hardship by the pilgrimage to Mecca. As in the East, "it is not forbidden to trade during the pilgrimage," and when there are no wars to make the roads unsafe, eighty thousand people have assembled among the mountains to barter and pay homage to "our Lord of Esquipulas."

"The town of Esquipulas contains a population of about 1500 Indians. There was one street nearly a mile long, with mud houses on each side; but most of the houses were shut, being occupied only during the time of the fair. At the head of this street, on elevated ground, stood the great church.

"Ascending by a flight of massive stone steps in front of the church, we reached a noble platform a hundred and fifty feet broad, and paved with bricks a foot square. The view from this platform of the great plain and the high mountains around was magnificent; and the church, rising in solitary grandeur in a region of wildness and desolation, seemed almost the work of enchantment. The façade was rich with stucco ornaments and figures of saints larger than life; at each angle was a high tower, and over the dome a spire, rearing aloft in the air the crown of that once proud power which wrested the greatest part of America from its rightful owners, ruled it for three centuries with a rod of iron, and now has not within it a foot of land or a subject to boast of.

"We entered the church by a lofty portal, rich in sculptured ornaments. Inside was a nave with two aisles, separated by rows of pilasters nine feet square, and a lofty dome guarded by angels with expanded wings. On the walls were pictures, some drawn by artists of Guatemala and others that had been brought from Spain, and the recesses were filled with statues, some of which were admirably well executed. The pulpit was covered with gold-leaf, and the altar protected by an iron railing with a silver balustrade, ornamented with six silver pillars about two feet high, and two angels standing as guardians on the steps. In front of the altar, in a rich shrine, is an image of the Saviour on the cross, 'our Lord of Esquipulas,' to whom the church is consecrated, famed for its power of working miracles. Every year thousands of devotees ascend the steps of his temple on their knees, or laden with a heavy cross, who are not permitted to touch the sacred image, but go away contented in obtaining a piece of riband stamped with the words, 'Dulce nombre de Jesus.'"

On leaving Esquipulas the road ascends the mountain of Quezaltepeque, the brows of which are thickly wooded, muddy, and full of gullies. The route on the heights commands a splendid view of the plain of Esquipulas, with the great sierra behind, covered with lofty pines, the great church, and the village of *Quezaltepeque*. The descent on the opposite side is very precipitous, with mud-holes and deep gulleys.

A narrow path leads along the very edge of the precipice, part of the way on a narrow overhanging ledge, and in other places by a path constructed on the face of the rock to the bottom of the ravine. The ravine at the bottom extends between precipitous walls of dark limestone, deep, narrow, and remarkably savage in aspect, with a stream rolling through it over rocks.

From this wild pass to the *richuelo* of San Jacinto, there is no cultivation, and the whole country remains in primeval wildness.

On leaving San Jacinto, where he was most hospitably treated by the padre,* Mr. Stephens remarks,

"For the first time in a long while we had a level road. The land was rich and productive: brown sugar sold for three cents a pound; and white lump, even under their slow process of making it, for eight cents; and indigo could be raised for two shillings a pound."

On the following day, having lodged in a place filled with negroes, children, and flies, he travelled onwards, and had on his right the Montagua River and the mountains of Vera Paz. The road was level; it was excessively hot; and late in the afternoon, he came upon a table-land covered with trees, bearing a flower, looking like apple-trees in blossom, and cactus or tunos, with branches from three to fifteen feet long.

He rode into Chimalapa, a long straggling village with a large church, but no cura, and he proceeded to the Cabildo, or the town-house, which was also used as a sort of caravansary for travellers; a remnant of oriental usages introduced from Spain, into her former American possessions.

Next day he travelled onwards, and at the foot of a high mountain, a cluster of cocoa-nut-trees, glittered in the sunbeams like plates of silver, and concealed *Guastatoya*, a town beautifully situated, overlooking a valley, waving with Indian corn. Here, at the house of the brother of Donna Bartola, his hostess of Guelan, he had a good supper of eggs, frijoles, chocolate, and tortillas. Leaving *Guastatoya*, he rode for some distance through a cultivated country, with the fields divided by fences.

Next day, as he travelled onwards, the country presented magnificent views. He saw, at a great distance below the heights, in an amphitheatre of mountains, the village of El Puente, the ground around which was white and trodden hard by caravans of mules. On descending to the village, he crossed a bridge, supported by a stone arch, thrown across a ravine with a cataract foaming through it. This point was completely encircled by mountains, "wild to sublimity, and reminding him of some of the finest parts of Switzerland."

He then says, "We passed a village of huts, situated on the ridge of the mountains,

* "The *Padre* of San Jacinto appears to have been a man above six feet, broad-shouldered, and with a protuberance in front that required support to keep it from falling. His dress consisted of a shirt and pair of pantaloons, with button-holes begging for employment; but he had a heart as big as his body, and as open as his wearing apparel; and when I told him that I had ridden from *Esquipulas* that day, he said I must remain a week to recruit; as to going the next day he would not hear of it; and, in fact, very soon I found that it was impossible without other aid, for my abominable muleteer filled up the measure of his iniquities by falling ill with a violent fever.

"The padre insisted on my taking his own c  che, which was unusually neat, and had a mosquito-netting. It was my best bed since I left Colonel McDonald's at Belize. Before I was up he stood over me with a flask of *agua ardiente*; soon after came chocolate, with a roll of sweet bread; and finding that it was impossible to get away that day, I became a willing victim to his hospitality. At nine o'clock we had breakfast; at twelve, fruit; at two, dinner; at five, chocolate and sweet bread; and at eight, supper; with constant intermediate invitations to *aqua ardiente*, which the padre, with his hand on that prominent part of his own body, said was good for the stomach. In every thing, except good feeling, he was the complete antipodes of the Cura of *Esquipulas*.

commanding on both sides a view of an extensive valley 4000 or 5000 feet below us. Continuing on this magnificent ridge, we descended upon a table of rich land, and saw a gate opening into grounds which reminded me of park scenery in England; undulating, and ornamented with trees. In the midst of this stood the hacienda of San José, a long, low, stone building, with a corridor in front; it was one of those which, when least expected, touch a tender chord, call up cherished associations, make a traveller feel as though he could linger around it for ever, and particularly welcome to us, as we had not breakfasted.

"It was a *hacienda de ganados*, or cattle hacienda, and had hundreds of cattle roaming over it; but all that it could give us to eat was eggs, tortillas, and beans, softened in hot water; the last being about equal to a basket of fresh chips. The road from this place lay over a table of land, green and rich as an European lawn, ornamented with trees, and 'with features of scenery peculiarly English;' muleteers, who had left the city at midnight, were lying under the shade of the trees, their saddles and cargoes piled over each other, and their mules pasturing near. Along the table-land, there were ruins of huts, and 'if adorned instead of being deformed by the hand of man, this would be a region of poetic beauty.' Indians, men and women, with loads on their backs;—each party carried a bundle of rockets. They were all returning from the 'capitol,' as they proudly call Guatemala to their villages among the mountains. Two days before, the Indian chief, Carrera, had re-entered the city with his soldiers."

After giving some account of the new capital of Central America, Mr. Stephens, on the 17th of December, set out on an excursion to *La Antigua Guatemala* and the Pacific Ocean, accompanied by a young man, who wished to ascend the volcano de Agua. He says:

"As we continued, the mountains turned to the left, and on the other side of the stream were a few openings cultivated with cochineal, into the very hollow of the base. Again the road turned and then ran straight, making a vista of more than a mile between the mountains, at the end of which was the *Antigua* (Guatemala), standing in a delightful valley, shut in by mountains and hills that always retain their verdure, watered by two rivers that supply numerous fountains, with a climate in which heat or cold never predominates; yet this city, surrounded by more natural beauty than any location I ever saw, has, perhaps, undergone more calamities than any city that was ever built. We passed the gate and rode through the suburbs, in the opening of the valley. On one side of which was a new house that reminded me of an Italian villa."

A large cochineal plantation extended to the base of the mountain. He crossed a stream bearing the poetical name of El Rio Pensativo, on the other side was a fine fountain, and at the corner of the street was the ruined church of San Domingo.

"The route from Old Guatemala towards the Pacific was," says Mr. Stephens, "level and wooded. We passed a trapiche, or sugar-mill, worked by oxen, and before daylight reached the village of Masagua, four leagues distant, built in a clearing cut out of the woods, at the entrance of which we stopped under a grove of orange-trees, and by the light of the moon, filled our pockets and *alforgas* with the shining fruit. Daylight broke upon us in a forest of gigantic trees, from seventy-five to a hundred feet high, and from twenty to twenty-five feet in circumference, with creepers winding around their trunks and hanging from the branches. The road was merely a path through the forest, formed by cutting away shrubs and branches. The freshness of the morning was delightful. We had descended from the table-land, called the *tierras templadas*, and were now in the *tierras calientes*; but at nine o'clock the glare and heat of the sun did not penetrate the thick shade of the woods. In some places the branches of the trees, trimmed by the machete of a passing muleteer, and hung with a grapery of vines and creepers, bearing red and purple flowers, formed, for a long distance, natural arches more beautiful than any ever fashioned by man, and there were parrots and other birds, of beautiful plumage flying among the trees; among them, guacamayas, or great macaws,

clad in red, yellow, and green. There were also vultures and scorpions, and, running across the road and up the trees, innumerable iguanas or lizards, from an inch to three feet long. The road was a mere track among the trees. Muleteers, bringing up goods from the port to the capital, were met twice; otherwise the route was desolate."

Twelve miles from Old Guatemala, Mr. Stephens stopped at the hacienda of Naranjo, occupied by a major-domo, who looked after the cattle of the proprietor, roaming wild in the woods: the house stood in the midst of a clearing, built of poles, with a cattle-yard in front. He "spied a cow with a calf, which was a sign of milk." The major-domo, with a lazo, caught the calf first, and then the cow, and hauled her up by the horns to a post.

"The hut," he observes, "had but one guacal, or drinking-shell, made of a gourd, and it was so small that we sat down by the cow so as not to lose much time. We had bread, chocolate, and sausages, and after a ride of twenty-four miles made a glorious breakfast; but we exhausted the poor cow, and I was ashamed to look the calf in the face."

The great plain over which he travelled, as far as Overo, about forty miles, was densely wooded and uncultivated, the soil rich and capable of maintaining, with little labour, thousands of inhabitants. Passing by Overo the country was more open.

The River Michatoyat, whence the *path* first meets the waters of the Pacific, is the outlet of the Lake of Amatitlan, and is said to be navigable from the Falls of San Pedro Martyr, seventy miles from its mouth; but there were no boats upon it, and its banks are still in a wilderness state. The crossing place was at the old mouth of the river.

IZTAKA.—The port at the mouth of this river is an open roadstead, without bay, headland, rock, or reef, or any mark whatever to distinguish it from the adjacent shores. "There is no light at night, and vessels at sea take their bearings from the great volcanoes of the Antigua, more than sixty miles inland. A buoy was anchored outside of the breakers, with a cable attached, and under the sheds were three large launches for embarking and disembarking the cargoes of the few vessels which resort to this place." At the time of Mr. Stephens' visit, a ship from Bordeaux lay off, more than a mile from the shore. Her boat had some time before landed the supercargo and passengers, since which she had had no communication with the land. Behind the sandbar were a few Indian huts and Indians nearly naked. Generally the sea is, as its name imports, pacific, and the waves roll calmly to the shore; but in the smoothest times there is a breaker, and to pass this, as a part of the fixtures of the port, an anchor is dropped outside with a buoy attached, and a long cable passing from the buoy is secured on the shore. It was from this place that Alvarado fitted out his armament and embarked with his followers to dispute with Pizarro the riches of Peru. Around the base of the volcano *do Agua*, are cultivated fields and a belt of forest and verdure extends to the top. Opposite there is another volcano with its slopes wooded with magnificent trees. Between the two there is a convent of Domi-

nican friars, and a beautiful valley in which there are hot springs, smoking for more than a mile along the road, near which the nopals, or cochineal plantations, commence. On both sides are high clay walls, and Mr. Stephens says these *nopals* are more extensive than those of the Antigua, and more valuable, as though only twenty-five miles from it, the climate is so different that they produce two crops in each season.

Here was one of the largest cochineal plantations, which contained 400,000 plants. It was in charge of a citizen of the United States, from Rheinbeck Landing, on the Hudson River, where his father then kept a *store*. He had been a clerk in New York, and then in Mexico. Induced by a large offer, and a strong disposition to ramble and see the country, he accepted a proposal from another American, who exhibited wild beasts, to accompany him.

"His business was to go on before the caravan, *hire a place, give notice*, and make preparations for the exhibition of the animals. In this capacity he had travelled all over Mexico, and from thence to Guatemala. It was seven years since he left home, and since parting with his American employer, he had not spoken a word of his own language, and as he spoke it now it was more than half Spanish."

The road from this place to New Guatemala leads across a plain with high, nearly precipitous, and verdant elevations on the left, for about a league, where the ascent is by a steep height to the table-land of Guatemala. This road Mr. Stephens considered at the time the most delightful ride he had had in the country.

Mr. Stephens visited the Lake of Amatitlan ; it was dark when he reached the top of the high range of mountains which bounds this lake.

"Looking down," he says, "it seemed like a gathering of fog in the bottom of a deep valley. The descent was by a rough zigzag path on the side of a mountain, very steep, and in the extreme darkness, difficult and dangerous. We felt happy when we reached the bank of the lake, though still a little above it. The mountains rose round it like a wall, and cast over it a gloom deeper than the shade of night. We rode for some distance with the lake on our left, and a high and perpendicular mountain-side on our right. A cold wind had succeeded the intense heat of the day, and when we reached Amatitlan, I was perfectly chilled."

He afterwards embarked in a goelette brig, the only vessel on the Pacific, which carried the Central American flag. This vessel was built in England for a cutter, and called the *Britannia*. He knew not by what means this craft reached the Pacific, where she was "bought by the state of San Salvador, when at war with Guatemala, and called by that state's Indian name of Cuscatlan. Afterwards, she was sold to an Englishman, who called her *Eugenia*, and by him to Captain D'Yriarte, who called her *La Cosmopolita*."

Sailing along the coast, they passed the volcanoes of San Salvador, San Vincente, San Miguel, Tolega, Momotombo, Managua, Nindiri, Nasaya, and Nicaragua, forming an uninterrupted chain.

Mr. Stephens remarks, "This coast has well been described as bristling with volcanic cones. For two days we lay with sails flapping in sight of Cape Blanco, the upper headland of the Gulf of Nicoya. On the afternoon of the 31st we entered the gulf. In a line with a point of the cape was an island of rock, with high, bare, and precipitous sides, and the top covered with verdure. It was about sunset ; for nearly an hour the

sky and sea seemed blazing with the reflection of the departing luminary, and the islands of rock seemed like a fortress with turrets. It was a glorious farewell view. I passed my last night on the Pacific, with the highlands of the Gulf of Nicoya close around us.

"Early in the morning we had the tide in our favour, and very soon leaving the main body of the gulf, turned off to the right, and entered a beautiful little cove, forming the harbour of Caldera. In front was the range of mountains of Aguacate, on the left the old port of Pont Arinas, and on the right the volcano of San Pablo. On the shore was a long low house, set upon piles, with a tile roof, and near it were three or four thatched huts and two canoes. We anchored in front of the houses, and apparently without exciting the attention of a soul on shore."

He says that, "All the ports of Central America on the Pacific are unhealthy—but this was considered deadly. I had entered, without apprehension, cities where this plague was raging, but here, as I looked ashore, there was a death-like stillness that was startling."

From Caldera the country inland is level, rich, and uncultivated, with here and there a wretched cattle hacienda, the owners of which live in the towns. Herds are stationed on the estates, from time to time, to gather and number the cattle, which roam wild in the woods. One hacienda, called San Felipe, belonged to a Welchman engaged in mining. It was in a large clearing, and a fine situation, with neat buildings and good fences. At the hacienda of San Mateo, situated in the bocca of the mountain of Aguacate, the route to the high grounds is steep, wild, and rugged.

"As we toiled up the ravine," says Mr. Stephens, "we heard before us a loud noise that sounded like distant thunder, but regular and continued, and becoming louder as we advanced; and at length we came out on a small clearing, and saw on the side of the mountain a neat frame building of two stories, with a light and graceful balcony in front, and alongside was the thundering machine which had startled us by its noise. Strangers from the other side of the Atlantic were piercing the sides of the mountain, and pounding its stones into dust in search for gold. The whole range, the very ground which our horses spurned with their hoofs, contained that treasure for which man forsakes kindred and country.

"The superintendent was a German from Friesburg. His house was furnished with chairs, sofa, and books, and had in my eyes a delightful appearance; but the view without was more so. The stream which turned the immense pounding machine had made the spot, from time immemorial, a *descansadera*, or resting-place for muleteers. All around were mountains, and directly in front, one rose to a great height, receding and covered to the top with trees."

This German had been superintendent of the Quelrada del Ingenio for about three years.

"The company which he represented was called the *Anglo Costa Rican economical Mining Company*. It had been in operation three years without losing any thing, which was considered doing so well that it had increased its capital and was about continuing on a larger scale. The machine, which had just been set up, was a new German patent, called a machine for extracting gold by the *Zillenthal Patent Self-acting Cold Amalgamation Process* (I believe that I have omitted nothing), and its great value was, that it required no preliminary process; but by one continued and simple operation extracted the gold from the stone. It was an immense wheel of cast-iron, by which the stone, as it came from the mountain, was pounded into powder; this passed into troughs filled with water, and from them into a reservoir containing vases, where the gold detached itself from the other particles, and combined with the quicksilver with which the vases were provided."

There were several mines under his charge, that of Corvallio was the largest. The few geologists who have visited Western Central America have asserted that immense wealth lies buried in the mountain of Aguacate ; and that its localities are most evident. The lodes, or mineral veins, run north and south, in strata of greenstone, porphyry, and basaltic porphyry, and average about three feet in width. In some places, side cuts, or lateral excavations are made from east to west, and in others, shafts are sunk until they strike the vein.

"After leaving the mines," Mr. Stephens observes, "as we continued ascending, every moment the view became more grand and beautiful; and suddenly from a height of six thousand feet, I looked down upon the Pacific, the Gulf of Nicoya, and, sitting like a bird upon the waters, our brig, *La Cosmopolita* ; and here on the very highest point, in the wildest and most beautiful spots that ever men chose for their abodes, were the huts of the miners. The sun touched the sea, lighted up the surface of the water, and softened the rugged mountains, it was the most beautiful scene I ever saw, and the loveliest view was the last ; for suddenly it became dark, and very soon the darkest night I ever knew came on; as we descended, the woods were so thick that even in the daytime they shut out the light, and in some places the road was cut through steep hills higher than our heads, and roofed over by the dense foliage. Hezoos (the guide) was before me with a white hat and jacket, and had a white dog running by his side, but I could not see the outline of his figure. The road was steep but good, and I did not pretend to direct the mule. In one of the darkest passages Hezoos stopped, and, with a voice that made the woods ring, cried out, 'a lion, a lion.' I was startled, but he dismounted and lighted a cigar. This was cool, I thought ; he relieved me by telling me that the lion was a different animal from the roarer of the African desert, small, frightened by a shout, and only ate children."

As he advanced inland, the country improved, and for a league before entering Alagueta, the road was lined on both sides with houses 300 or 400 yards apart built of whitewashed adobes, and the fronts of some ornamented with paintings. Several had chalked in red, on each side the door, the figure of a soldier, with his musket shouldered and bayonet fixed, "large as life and stiff as a martinet." The rows of trees on both sides of the road were bearing beautiful flowers, which, in some places, "completely embowered the houses." In the fields the growing of sugar-canes was the chief culture ; every house had attached a small *trapiche*, or sugar-mill.

There are four cities in Costa Rica, all of which lie within the space of fifteen leagues ; yet each has a different climate and different productions. Including the suburbs, *Alagueta* contains a population of about 10,000. The Plaza was beautifully situated, and the church, the cabildo, and the houses fronting it were handsome. The latter were long and low, with broad piazzas and large windows, having wooden balconies.

"It was Sunday," says Mr. Stephens, "and the inhabitants, cleanly dressed, were sitting on the piazzas, or with doors wide open, reclining in hammocks, or on high-backed wooden settees inside. The women were dressed like ladies, and some were handsome, and all white ; a respectable-looking old man, standing at the door of one of the best houses, called out 'Amigo,' 'friend,' and asked us who we were, whence we came, and whither we were going, recommending us to God at parting ; and all along the street we were accosted in the same friendly spirit. Water was carried, from a great distance, to the town by women.

"Why a large town has grown up and been continued so far from this element of life

I do not know. The Spaniards found it a large Indian village, and as they immediately made the owners of the soil their drawers of water they did not feel the burden, nor do their descendants now.

"The volcano of Masaya was called by the Spaniards *El Infierno de Masaya*, or the Hell of Masaya."*

Mr. Stephens ascended to the crater of this volcano, which he says "was about a mile and a half in circumference, five or six hundred feet deep, with sides slightly sloping, and so regular in its proportions that it seemed an artificial excavation. The bottom was level, both sides and bottoms covered with grass, and it seemed an immense conical green basin. There were none of the fearful marks of a volcanic eruption; nothing to terrify or suggest an idea of *el infierno*; but, on the contrary, it was a scene of singular and quiet beauty. I descended to the edge of the crater, and walked along the edge, looking down into the area. Toward the other end was a growth of arbolitos or little trees, and in one place no grass grew, and the ground was black and loamy, like mud drying up."

Managua is described as beautifully situated on the banks of the lake.

Means of Intercourse.—On an ox-waggon, with the luggage and a stock of corn and grass for the mules during the intended voyage, they reached *Viejo*, "one of the most respectable-looking towns in Nicaragua. The house of the owner of the bongo was one of the largest in the place, and furnished with two mahogany sofas, made by a Yankee cabinet-maker in Lima, two looking-glasses with gilt frames, a French clock, gilt chairs with cane-bottoms, and two Boston rocking-chairs, which had made the passage round Cape Horn."

From this place he started for the port of Naguiscolo, seven leagues distant, through a forest. He overtook the bongo men, nearly naked, moving in single file, with the pilot at their head, and each carrying on his back an open network containing tortillas and provisions for the voyage. When he arrived at the port he found only a single hut, at which a woman was washing corn, with a naked child blotched with sores.

"In front was a large muddy plain, through the centre of which ran a straight cut called a canal, with an embankment on one side dry, the mud baked hard and bleached by the sun. In this ditch lay several bungoes high and dry, adding to the ugliness of the picture.

"The bongo in which we started was about forty feet long, dug out of the trunk of a guanacaste-tree, about five feet wide and nearly as deep, with the bottom round, and a *toldo*, or awning, round like the top of a market-waggon, made of matting and bull's hides, covered ten feet of the stern. Beyond were six seats across the sides of the bongo for the oarsmen. The whole front was necessary for the men, and in reality I had

* One historian, speaking of Nicaragua, says,—“There are burning mountains in this province the chief of which is Masaya, where the natives, at certain times, offered up maids, throwing them into it, thinking by their lives to appease the fire, that it might not destroy the country; and they went to it very cheerful.” And in another place he says, “Three leagues from the city of Masaya, being a burning mountain, the mouth of it being half a league in compass, and the depth within it 250 fathoms. There are no trees nor grass, but birds build without any disturbance from the fire. There is another mouth like that of a well about a bowshot over, the distance from which to the fire is about 150 fathoms, always boiling up, and that mass of fire often rises and gives a great light, so that it can be seen at a considerable distance. It moves from one side to the other, and sometimes roars so loud that it is dreadful, yet never casts up any thing but smoke and flame. The liquor never ceasing at the bottom, nor its boiling, imagining the same to be gold. F. Blase de Yniesta, of the order of St. Dominick, and two other Spaniards were let down into the first mouth in two baskets, with a bucket made of one piece of iron, and a long chain to draw up some of that fiery matter and know whether it was metal. The chain ran 150 fathoms, and as soon as it came to the fire the bucket melted, with some links of the chain in a very short time, and therefore they could not know what was below. They lay there that night without any want of fire or candles, and came out again in their baskets sufficiently frightened.”

This account is evidently much exaggerated.

only the part occupied by the awning where, with the mules as tenants in common, there were too many of us."

The sun was scorching, and under the awning the heat was insufferable. Following the coast at eleven o'clock they were opposite the volcano of Coseguina, a long dark mountain promontory, with another ridge running below it, and then an extensive plain covered with lava to the sea.

"Before we reached the volcano of Coseguina,* with its field of lava and its desolate shore, not a living being was in sight except my sleeping boatmen.

"Towards evening my men all woke; the wind was fair, but they took things quietly, and after supper hoisted sail. About twelve o'clock, by an amicable arrangement, I stretched myself on the pilot's bench under the tiller, and when I woke we had passed the volcano of Tigris, and were in an archipelago of islands more beautiful than the islands of Greece. The wind died away, and the boatmen, after plying a little while with the oars, again let fall the big stone and went to sleep. Outside the awning the heat of the sun was withering, under it the closeness was suffocating, and my poor mules had had no water since their embarkation. Fortunately, before they got tired we had a breeze, and at about four o'clock in the afternoon the big stone was dropped in the harbour of *La Union*, in front of the town. One ship was lying at anchor, a whaler from Chili, which had put in in distress and been condemned."

From this place he travelled to St. Miguel, and stopped on his way at the village of San Alejo, where the people were in a state of excitement from the report of an invasion from Honduras.

* The eruption of this volcano on the 20th of January, 1835, was one of the most awful in the history of volcanic eruptions. It greatly alarmed the people of Guatemala, 400 miles off; at Kingston, Jamaica, 800 miles distant, the reports heard were so distinct as to be considered guns of distress fired by ships at sea. "The face of nature was changed; the cone of the volcano was gone; a mountain and field of lava ran down to the sea; a forest, old as creation, had entirely disappeared, and two islands were formed in the sea; shoals were discovered, in one of which a large tree was fixed upside down; one river was completely choked up, and another formed, running in an opposite direction; seven men in the employ of my bungo proprietor ran down to the water, pushed off in a bungo, and were never heard of more; wild beasts, howling, left their caves in the mountains, and ounces, leopards, and snakes fled for shelter to the abodes of man."

A Mr. Savage, who was on that day on the side of the volcano of San Miguel, distant 120 miles, looking for cattle, saw at eight o'clock a dense cloud rising in the south in a pyramidal form, and heard a noise which sounded like the roaring of the sea. Soon after, there appeared amidst the clouds, bright, rose-coloured, forked lightning. "These appearances," says Mr. Stephens, "increased so far that his men became frightened, and said it was a ruina, and that the end of the world was nigh. Very soon he himself was satisfied that it was the eruption of a volcano. He returned to the town of San Miguel, and in riding felt three severe shocks of earthquake. The inhabitants were distracted with terror. Birds flew wildly through the streets, and blinded by the dust, fell dead on the ground. At four o'clock it was so dark that, as Mr. Savage says, he held up his hand before his eyes, and could not see it. Nobody moved without a candle which gave a dim and misty light, extending only a few feet. At this time the church was full, and could not contain half the people who wished to enter. The figure of the Virgin was brought out into the plaza and borne through the streets, followed by the inhabitants, with candles and torches, in penitential procession, crying upon the Lord to pardon their sins. Bells tolled, and during the procession there was another earthquake, so violent and long that it threw to the ground many people walking in the procession. The darkness continued till eleven o'clock the next day, when the sun was partially visible, but dim and hazy, and without any brightness. The dust on the ground was four inches thick, and branches of trees broke with its weight, and people were so disfigured by it that they could not be recognised.

At this time Mr. Savage set out for his hacienda at Sonzonate. He slept at the first village, and at two or three o'clock in the morning was roused by a report like the breaking of most terrific thunder, or the firing of thousands of cannon. This was the report which startled the people of Guatemala, when the commandant sallied out, supposing that the quartel was attacked, and which was heard at Kingston in Jamaica. It was accompanied by a most violent earthquake.

Riding up the principal street in San Salvador, he passed a "large church with its front fallen, and saw paintings on the walls, and an altar forty feet high, with columns, images sculptured and gilded, exposed to the open air."

The state of San Salvador he considers the richest in Central America, extending 180 miles along the shores of the Pacific, producing tobacco, the best indigo, and richest balsam in the world. In travelling over it, he says,

"We had mountains and rivers, valleys and immense ravines, and the three great volcanoes of San Miguel, San Vincente, and San Salvador, one or other of which was almost constantly in sight. The whole surface is volcanic; for miles the road lay over beds of decomposed lava, inducing the belief that here the whole shore of the Pacific is an immense arch over subterraneous fires. From the time of the independence this state stood foremost in the maintenance of liberal principles, and throughout, it exhibits an appearance of improvement, a freedom from bigotry and fanaticism, and a development of physical and moral energy not found in any other. The San Salvadoreans are the only men who speak of sustaining the integrity of the Republic as a point of national honour."

The Lempa was then a gigantic river rolling on to the Pacific. Three months before, he had seen it "a little stream among the mountains of Esquipulas." He was overtaken by a Don Carlos Rivas, "a leading liberal from Honduras, flying for life before *partisan soldiers of his own state*."

"We descended to the bank of the river, and followed it through a wild forest, which had been swept by a tornado, the trees still lying as they fell. At the crossing-place, the valley of the river was half a mile wide; but being the dry season, on this side there was a broad beach of sand and stones."

After crossing the Lempa, he says,

"We slept upon our luggage on the bank of the river, and before daylight were again in the saddle. Crossing a beautiful plain, running to the base of the volcano of San Vincente, we left our animals at a hut, and walked some distance to a stream in a deep ravine, which we followed upward to its source, coming from the very base of the volcano. The water was warm, and had a taste of vitriol, and the banks were incrustated with white vitriol and flour of sulphur. At a distance of one or two hundred yards it formed a basin, where the water was hotter than the highest grade of my Reaumur's thermometer. In several places we heard subterranean noises, and towards the end of the ravine, on the slope of one side, was an orifice about thirty feet in diameter, from which, with a terrific noise, boiling water was spouted into the air. This is called El Infiernillo, or the 'Infernal Regions.'

"We arrived at *Cojutepeque*, until within two days the temporary capital, beautifully situated at the foot of a small extinct volcano. Its green and verdant sides, broken only by a winding path, and on the top a fortress, which Morazan had built as his last rallying-place."

Mr. Stephens entered by a fine gate, and through suburbs teeming with fruit and flower trees, the meanness of the houses was hardly noticed. Advancing, he saw heaps of rubbish, and large houses with their fronts cracked and falling, marks of the earthquake, which had broken it up as the seat of government, and almost depopulated the city.

On leaving San Salvador at three o'clock the next morning, a stream of fire was rolling down the volcano of Izaleo, bright, but paler by the moonlight.

On the right, after passing an Indian village, they looked down the perpendicular side to a plain 2000 feet below; and in front, on another part of the same

plain, were the lake and town of Aguachapa. Instead of going direct to the town, they turned round the foot of the mountain, and came into a field smoking with hot springs. The ground was incrustated with sulphur, and dried and baked by subterranean fires. In some places were large orifices, from which steam rushed out violently and with noise, and in others large pools or lakes, one of them 150 feet in circumference, of dark brown water, boiling, with monstrous bubbles, three or four feet high. All around, for a great extent, the earth was in a state of combustion, burning their boots and frightening the horses, and they were obliged to be careful to keep the horses from falling through. At some distance was a stream of sulphur-water, which they followed up to a broad basin, made a dam with stones and bushes, and had a most refreshing warm bath.

Below the table-land on which the town stands, a vast plain opens, and they passed the beautiful Lake of Aguachapa.

On reaching the Rio Paz, on both sides trees spread their branches over the water. The River of Peace, so called, was then, and may be now, the boundary of deadly war between Guatemala and San Salvador.

On crossing, they were in the state of Guatemala, on the banks of a wild river without any visible path, and then in a precarious situation. They were fortunate in finding a path which turned off to the left, and terminated in the Camino Real, leading from the fording place. The face of the country was entirely changed, broken and stony, and they saw no one till they reached the hacienda of Palmita. This, too, seemed desolate. They entered the yard and did not see a single person till they pushed open the door of the house.

At twelve o'clock on the following day, they reached the *Rio de los Esclavos*, a wild and majestic river, the bridge across which is the greatest structure erected under Spanish dominion in Central America. They crossed it; the village beyond it was a mere collection of huts, standing in a magnificent situation near the river, and above which mountains rose, covered to the summits with pines. Every predatory or fighting expedition between Guatemala and San Salvador passed through this miserable village. Twice within one week Morazan's army was so straitened for provisions, and pressed by fear of pursuit, that huts were torn down for fire-wood, and bullocks slain and eaten half raw in the street, without bread or tortillas.

After leaving this village the country was covered with lava. The hacienda of Coral de Piedra was passed, situated on the crest of a stony mountain, looking like a castle, very large, with a church and village, where, although it rained, they did not stop, as the whole village seemed to be intoxicated.

"The next morning, one of the mules was missing, and we did not get off till eight o'clock. Towards evening we descended a long hill, and entered the plain of Guatemala. It looked beautiful, and I never thought I should be so happy to see it again. I had finished a journey of 1200 miles, and the gold of Peru could not have tempted me to undertake it again."

CHAPTER V.

ROUTE FROM GUATEMALA TO PALENQUE.

EXCEPTING the account given by Juarros, and those detached descriptions in the large and lengthy work of the French traveller, Dupaix,* we know but little of the country north of Guatemala to the frontiers of Mexico. The most recent descriptions are the sketches made by Mr. Stephens on his route from Guatemala to the ruins of Palenque. After ceasing to look for "a government, as a hopeless search in the divided anarchical country to which he was sent as a minister from the United States, he packed up his diplomatic uniform and some other articles, and forwarded them to his own republic. He then tells us—

"I was once more my own master, at liberty to go where I pleased, *at my own expense*, and immediately we commenced making arrangements for our journey to Palenque. We had no time to lose; it was a thousand miles distant, and the rainy season was approaching, during which part of the road was impassable. There was no one in the city who had ever made the journey. The archbishop, on his *exit from Guatemala* eight years before, had fled by that road, and since his time it had not been travelled by any resident of Guatemala; but we learned enough to satisfy us that it would be *less difficult to reach Palenque from New York than from where we were.*"

Having provided passports, he was fortified with the best security he could have for his journey. In Guatemala every man has a small cot made to double with a hinge, which may be taken down and wrapped up, with pillows and bed-clothes, in an ox-hide, to carry on a journey. Besides the horse or mule to ride on, each traveller requires at least another mule, and two *petacas*, trunks made of ox-hides, lined with thin straw matting having a top like that of a box, secured by a clumsy iron chain, with large padlocks; containing, if complete, besides other things, generally a hammock, blanket, one pair of sheets, a pillow, which with *alforgos* of provisions, make one load for a cargo mule. Besides these, Mr. Stephens travelled with one spare cargo mule and a spare horse to relieve the others, in all, six animals; and two *mozos*, or men of all work. He says,

"We set out for Quezaltenango, but intended to turn aside, and visit ruins.

"Decending to the plain, we entered the village of San Antonio, occupied entirely by Indians. The cura's house stood on an open *plaza*, with a fine fountain in front, and the huts of the Indians were built with stalks of sugar-cane.

"We were now entering upon a region of country which, at the time of the conquest, was the most populous, the most civilised, and best cultivated in Guatemala. The people who still occupied it were the descendants of those found there by Alvarado, and perhaps four-fifths were Indians of untainted blood. For three centuries they had submitted quietly to the dominion of the whites, but the rising of Carrera had waked them

* This work on the "Antiquities of Mexico," &c., published in Paris in 1834-5, awakened the attention of the learned in Europe. His expedition to Palenque was made in 1807. He travelled south as far as Ocosingo, near Comitan, from the city of Mexico, under a commission from the government, attended by a draughtsman, secretary, and a detachment of dragoons.

up to a recollection of their fathers, and it was rumoured *that their eyes rolled strangely upon the white men as the enemies of their race.*"

Here, for the first time, he saw fields of wheat and peach trees. The country was *poetically* called *Europa*; and though the Volcano de Agua still reared in full sight its stupendous head, it resembled the finest part of England on a magnificent scale. But he says, "it was not like travelling in England."

The road then led over a magnificent table-land, in some parts, and for a considerable distance, lined on each side with trees. In the afternoon they reached the brink of an immense precipice, in which, at a great distance, he saw "the molina or wheat-mill, looking like a New England factory."

At Patzum, a large Indian village, they turned off to the right from the high road to Mexico by a by-path; the country was beautiful, and in parts well cultivated. This great table-land was elevated from 5000 to 6000 feet. He passed two mounds, such as are seen in the United States.

Immense barrancas, or abrupt ravines, were also passed. Where these occur, the table-land is, according to Mr. Stephens, "level to the very edge where the earth seemed to have broken off and sunk," and he looked down into a frightful abyss 2000 or 3000 feet deep. Gigantic trees at the bottom of the immense cavity looked like shrubs. For some distance before reaching the Indian village of Tecpan Guatemala, the road was shaded by trees and shrubs, the aloes were thirty feet high. The long street by which he entered was paved with stones from the ruins of the old city, and filled with drunken Indians. At the head of this street was a *fine* plaza, with a large cabildo, and twenty Indian alguazils under the corridor, with wands of office, in full suits of blue cloth, the trousers open at the knees, and with a cloak with a hood like the Arab *burnouse*. The church, one of the most magnificent in the country, was the second built after the conquest. The façade was 200 feet, very lofty, with turrets and spires, gorgeously ornamented with figures. On its high platform were Indians in picturesque costume.

This city of Patinamit belonged to the ancient kingdom of Kachiquel. It was also called Tecpan Guatemala, which according to *Vasques*, means "the Royal House of Guatemala," from which he infers that it was the capital of the Kachiquel kings. Fuentes is of opinion that *Tecpan Guatemala* was the fortress or arsenal of the kingdom, and that Guatemala was the kingly residence.

A solitary Indian hut now occupies the site of the ancient city. Each year, however, on Good Friday, a grand procession of the whole neighbouring Indian population is made to it from Tecpan Guatemala.

Near Patzum, as the road leads over high, level table-land, there is a great abrupt *baranca*, or ravine, 3000 feet deep.

Descending from the plain, about 500 mules were passed loaded with wheat for the mills, and merchandise for Guatemala. The sides of the ravines were of an immense height. In one place they rode along a perpendicular wall of lime-stone

rock, smoking with spontaneous combustion. They travelled over a lofty table-land bordering the left of Atitlan; and descended, at first by a steep pitch, and then gently for about three miles along the precipitous border of the lake, leaving on the right the *camino real*, and the village of San Andres, and suddenly reached the brink of the table-land, 2000 feet high. At the foot was a rich plain running down to the water. In the plain, "buried in foliage, with the spire of the church barely visible, stood the town of Panajachel." The magnificent landscape comprehended "all the requisites of the grand and beautiful; gigantic mountains, a valley of poetic softness, lake and volcanoes, and from the height on which they stood, a waterfall marked a silver line down its sides. A party of Indian men and women were moving in single file from the foot of the mountain towards the village, and looked like children. The descent was steep and perpendicular, and, reaching the plain, the view of the mountain walls was sublime."

On reaching Tolola, a number of drunken Indians stood in a line, and took off their old petates (straw hats) with both hands. It was Sunday, and the bells of the church were ringing for vespers, rockets were firing, and a procession headed by fiddlers with their violins, was parading round the plaza the figure of a saint on horseback, dressed like a harlequin. Opposite the cabildo, the alcalde, with a crowd of mestitzoes, was fighting cocks.

Tololo stands on the lofty borders of the Lake of Atitlan, and a hundred yards from it the whole water was visible. Mr. Stephens says,

"I tied my horse to the whipping-post, and thanks to Carrera's passport, the alcalde sent off for *sacate*, had a room swept out in the cabildo, and offered to send us supper from his own house. He was about ten days in office, having been appointed since Carrera's last invasion."

Formerly, this place was the residence of the youngest branch of the reigning house of Kachiquel.

At Santa Thomas, a crowd of Indians was gathered in the plaza, well dressed in brown cloth, and with long black hair, without hats. The entire population was Indian. There was not a single white man in the place, nor one who could speak Spanish, except an old mestitzo, who was the secretary of the alcalde. Mr. Stephens' party rode up to the cabildo, and tied the mules before the prison door.

"Groups of villanous faces were fixed in the bars of the windows. We called for the alcalde, presented Carrera's passport, and demanded *sacate*, eggs, and frioles for ourselves, and a guide to Quiché. While these were got, the alcalde, and as many *alguazils* as could find a place, seated themselves silently on a bench occupied by us."

Ascending to the plain of Quiché, they came in view of the ancient capital of Utatlan, the royal residence of the native sovereigns of Quiché, and the most sumptuous city discovered by the Spaniards in Central America. Its site was worthy the abode of kings.

"We passed on," says Mr. Stephens, "between two small lakes, rode into the village, passed on, as usual, to the convent, which stood beside the church, and stopped at the foot of a high flight of stone steps. An old Indian on the platform told us to walk

in, and we spurred our mules up the steps, rode through the corridor into a large apartment, and sent the mules down another flight of steps into a yard enclosed by a high stone fence."

This convent was the first erected in the country by the Dominican friars before the death of Alvarado. Its original massive stone walls, corridors, pavements, and paved court, are still in such condition that it may serve what many of the religious edifices were constructed to answer—a monastery or a fortress. Mr. Stephens found its interior desolate, or filled with rubbish; one section was used for keeping fodder, *sacate*, another was for a kind of granary, and in a third, the fowls of the village roosted.

They arrived at Quezaltenango the day before Good Friday; the streets and plaza were crowded with people in their best attire, the Indians wearing large black cloaks, with broad brimmed felt sombreros, and the women a white frock, covering the head except an oblong opening for the face: some wore a sort of turban of red cord plaited with the hair. He met afterwards crowds of Indians staggering drunk after holiday fêtes.

He regretted not being able to explore the neighbouring country, for there was no place he had visited, except ruined cities, so unique and interesting, and which deserved to be so thoroughly explored, as Quezaltenango. A month, at least, might be satisfactorily and profitably employed in examining the many curious objects in the country around. For botanical researches it is the richest district in Central America. But he had no time even for rest.

Travelling northwards until he ascended the summit of the mountain range, he says,

"We were almost on a level with the tops of the volcanoes. As we ascended the temperature grew colder, and we were compelled to put on our ponchas. At half-past two we reached the top of the Sierra Madre, the dividing line of the waters, being twelve miles from Gueguetenango, and in our devious course making the second time that we had crossed the Sierra. The ridge of the mountain was a long level table *about half a mile* wide, with rugged sides rising on the right to a terrific peak. Riding about half an hour on this table, by the side of a stream of clear and cold water, which passes on, carrying its tribute to the Pacific Ocean, we reached a miserable rancho, in front of which the arriero proposed to encamp, as he said it was impossible to reach the next village. At a distance it was a glorious idea that of sleeping on the top of the Sierra Madre, and the scene was wild enough for the most romantic imagination; but not being provided against cold, we would have gladly exchanged it for an Indian village."

On arriving at the Rio Lagertere, the boundary between Guatemala and Mexico, he describes the scene as wild and of surpassing beauty, with its banks "shaded by some of the noblest trees of the tropical forests, water as clear as crystal, and fish a foot long, playing in it as gently as if there were no fish-hooks. No soldiers were visible, all was as desolate as if no human being had ever crossed the boundary before."

On entering Mexico, he observes,

"Since we left Güsta, we had not seen a human being; the country was still desolate and dreary; there was not a breath of air; hills, mountains, and plains were all barren and stony; but as the sun pressed above its horizon, its beams gladdened this scene of

barrenness. For two hours we ascended a barren stony mountain. Even before this the desolate frontier had seemed almost an impregnable barrier.

"At half-past ten we reached the top of the mountain, and on a line before us saw the church of Zapolouta, the first village in Mexico. Four hours' ride over an arid and sandy plain, brought us to Comitán."

At Comitán, the whole community, not excepting the revenue officers, are engaged directly or otherwise in smuggling, and its effect upon public morals was deplorable. The place itself was, however, so ill supplied, that when he sent for a washerwoman, there was "no soap in the town," and when he wanted the mules shod, "there was only iron enough to shoe one."*

After passing through Ocosingo, the country was found to be as wild as before the Spanish conquest, and without a habitation, until they reached Palenque. "The road was through a forest so overgrown with brush and underwood, as to be impenetrable, and the branches were trimmed barely high enough to admit a man's travelling under them on foot, so that on the backs of our mules we were constantly obliged to bend our bodies, and even to dismount. In some places, for a great distance around, the woods seemed killed by the heat, the foliage withered, the leaves dry and crisp, as if burned by the sun; and a tornado had swept the country."

As they approached near to Palenque, they came into "a region of fine pasture-grounds, and saw herds of cattle. The grass showed the effect of early rains, and the picturesque appearance of the country reminded me of many a scene at home; but there was a tree of singular beauty (the palm) that was a stranger, having a high, naked trunk, and spreading top, with leaves of vivid green, covered with yellow flowers."

He left Palenque for Yucatan. Mr. Stephens and Mr. Catherwood remained for some time at Palenque. His detailed account of those remarkable ruins is exceedingly interesting. In a sketch hereafter of the ruins of Central America, we allude to his description, though briefly. There are two routes, the one by Tobasco, the other by the Laguna de Terminos to Campeachy. Tobasco and Campeachy were at the time both besieged by the *Liberals* or *Revolutionists*.

Leaving the village of Palenque, they "entered immediately upon a beautiful plain, picturesque, ornamented with trees, and extending five or six days' journey to the Gulf of Mexico. The road was very muddy, but open to the sun in the morning, was not so bad as we feared, on the borders of a piece of woodland were singular trees, with a tall trunk, the bark very smooth, and the branches festooned with hanging birds'-nests." They afterwards proceeded by the Usamasinto to the Laguna de Terminos.

* Mr. Stephens says, "We were advised, after we had set out, that it was proper to have our horses shod, but there was no good blacksmith, except at Quezaltenango; and as we were at that place during a fiesta, he would not work. In crossing long ranges of stony mountains, not one of them suffered except Mr. Catherwood's riding mule, and her hoofs were worn down even with the flesh."

CHAPTER VI.

ISTHMUS OF PANAMA AND OF NICARAGUA.

IF there shall ever be an intelligent, wise, just, and permanent government in a country which possesses, with but few real disadvantages, so many of the great resources and powers of production as are composed within the boundary of Central America; then the excavation of a ship canal, and the construction of a railroad across the isthmus, either of Panama or Nicaragua, will be found works of the greatest importance; and, according to all the information which we have been enabled to obtain, very far from being formidable undertakings. At present the moral difficulties, arising from absence of confidence, which experience has destroyed in the government of any Spanish republic, are alone sufficient to deter prudent men from embarking in undertakings which, in the United Kingdom and in the United States, would be accomplished with little comparative hazard.

The whole isthmus of Central America embraces two, first, the Isthmus of Panama, the other the Isthmus of Nicaragua. To which we add the Mexican Isthmus of Tehuantepec.

The Andes of South America, though apparently and long considered as extending into Mexico without any break or pass, actually disappear at the Isthmus of Panama, between the mouth of the Rio Atrato and the bay of St. Miguel, where a plain extends nearly from the Atlantic to the Pacific. This plain, which is about 140 miles long, from east to west, terminates on the shores of the Caribbean Sea, at the western extremity of the Bay of Mandingo, or St. Blas, and near the city of Panama on the Pacific. It is for the most part level, not much elevated above the sea, except in one part, where the summit, which, according to the report of the French engineer, M. Garella, is 177 English feet. It is nearly covered with a forest of magnificent wood, and numerous small rivers flowing through it, fall either into the Bay of Darien, or into that of Panama.

The Chepo River is said to rise near the south-east extremity of the isthmus, under the name of Canada, and flows westward for many miles, and then to the south, and enters the Gulf of Panama, about twenty-five miles east of Panama. It is navigable from the sea to this bend, and a little higher up the small town of Chepo is situated on its banks. Opposite Mandingo Bay, on the Atlantic, the isthmus is a little less than twenty miles across in a direct line. But at the bottom of the Bay of Mandingo, two parallel ridges, which extend south-west and north-east, spread over the isthmus between that bay and Porto de Naos: stretching about seventy miles along the north coast. The summits of this ridge rise to above 1000 feet.

Between the Rio Chagres on the Atlantic, and the Bay of Chorrea on the Pacific, the hills are divided from each other by plains.

Among the rivers which drain the two last-mentioned districts, the Rio Chagres rises east of Port Velo, among the mountains behind the Bay of Mandingo. It flows westward through the centre of the isthmus between the above two parallel ridges. The Pequeni from the south-east is large and broad, and falls into the Chagres. Both streams rush rapidly forward to their junction, several miles below which, at Cruces, it flows at the rate of from about two to three miles and a half an hour; near its embouchure its rate is from one to two miles per hour. After entering the plain, twenty-four miles above the port of Chagres, it receives the Trinidad, which rises near the south coast and the town of Chorrea. The Trinidad is navigated by canoes up to Capua; it has no falls or other obstacles to navigation.

The Rio Caymito enters the Bay of Panama about ten miles west of the town of Chorrea; is very deep towards its mouth, and one branch of it continues navigable to the town of Chorrea; but the tide runs very strong in and out of the river, which is not impeded by a bar at its mouth, and the anchorage is much exposed.

The Gulf or Bay of Panama is about 132 miles broad at its mouth, and extends inwards for about 100 miles. Off the north-eastern shore there rises a number of rocky islands, *Islas de la Perlas*, among which a quantity of pearls are annually fished. Some rocky islands off its north-western coast form the Port of Panama. In this bay the average rise and fall of the tide two days after full moon is about twenty-one feet; on the opposite side of the isthmus, off Chagres, its rise is only a little more than one foot. The high-water mark in the Atlantic being about thirteen feet lower than on the Pacific coast.

The whole Isthmus of Panama to the boundary of Costa Rica is claimed as within the limits of the government of New Grenada: a government the stability and wisdom of which has not hitherto inspired such confidence in Europe, or in the United States of North America, as would justify an outlay, on the part of capitalists, in order to execute a great public work, which would otherwise be profitable to the undertakers, and of general benefit to the nations of the world.—(See observations hereafter on the constructing of a Canal from the Atlantic to the Pacific.)

The region from Punta Mala, on the western side of the Gulf of Panama, extending north-west between the Atlantic and Pacific for more than 400 miles, appears an uninterrupted chain of rocky mountains ascending into the plateau of Veragua. This plateau is estimated as rising 2000 to 3000 feet above the ocean, with peaks rising to 8000 feet or more. The most elevated peak appears to be the Silla de Veragua, not far from Veragua. These rocky mountains approach near to the shores of the Pacific, a belt of low-lands extends along the Atlantic.

The shores of the lagoon of Chiriqui are low and closely wooded.

Of the Bay of Mandingo, Chiriqui, San Blas, and other places south from the Rio San Juan, to the extremity of the Atlantic shores of the Isthmus of Panama, we owe our most authentic information to Mr. Roberts, who frequently visited those places to trade with the Indians. There is anchorage in Mandingo on the lee side of the numerous keys. "On arriving there," says Mr. Roberts, "the Indians recommended us to proceed to Great Playone River, as the most commodious place for loading the brig, and procuring a cargo with the greatest despatch. They shortly left us, but returned in the evening, accompanied by several canoes and dories,* from the shore, bringing plantains, bananas and cocoa-nuts, cassava, hogs, fowl, and turtle; in exchange for which, we gave them fishhooks, small glass beads, Dutch looking-glasses, salt, and other articles, which, except to them, were of very trifling value. Our crew, in the meantime, put out their fishing-lines, and soon caught plenty of groupers, red and silver snappers, stone bass, and a variety of other fish, so that we had abundance of excellent provisions.

"Having thus apprised the Indians of our arrival on the coast, we next day got under weigh, and ran down the inner passage, between the small keys or islands, and the mainland. This passage is full of coral rocks and reefs, but the water is so clear, that they are easily seen and avoided in the day-time by keeping a man stationed at the mast-head, on the look out, to give warning of the vessel's approach to them. At night, however, this inner passage, the whole distance from Mandingo to Caret, is totally impracticable."

Between these points, are the entrance of numerous rivers, the sources of which are unknown, being situated in the interior, or occupied by tribes who have maintained their independence.

The vessel in which Mr. Roberts traded anchored off the River Daablo; fired a gun as a signal to the Indians, whose chief settlements are situated on the banks of the rivers, a considerable way up from the sea. The report of even a six-pounder on this coast, is heard an immense way up the country; but it is only the acute ear of an Indian, that can distinguish between its reverberations among the mountains, and the more frequent sound of distant thunder. On hearing this signal-gun, canoes are immediately despatched, for the purpose of ascertaining the object of such a visit. Sometimes they arrive the same evening, but at all times not later than next morning.

He proceeded to Needle Key, being the most eligible place for collecting fustic, the most bulky, although the least valuable part of a cargo. He was visited by the chiefs, and by the Sookeah man, priest, or conjuror, of the Great and Little Playone tribes. He hired a few Indians, who very expeditiously erected a temporary house for him on one of the keys, to deposit his goods for sale. The Indians shortly arrived from all parts of the coast, with fustic, in canoes

* A kind of large boat made out of the trunk of a tree.

and dories; some of them brought from 500 cwt., up to three, four, or five tons, but none of them exceeding the latter quantity. In exchange he gave them ravenduck, osnaburg, checks, blue baftas, and other manufactured goods—*moss-chettes*, (or G. R. cutlass-blades), and a variety of toys and small articles, adapted to this trade, for which articles in barter, an enormous price was obtained. Hogs, fowls, and an abundant variety of provisions and fruits, were brought from various rivers, and sold to him at a very trifling consideration. The hogs, at this place, were turned loose on the key during the day-time, to seek for food; but at night, either from habit, or an instinctive fear of wild beasts, they invariably kept crowded together in a body, close to the house.

He fitted out two large boats, by the Spaniards called bongos, for an excursion along the coast, putting a few goods on board, and procuring the assistance of an Indian trader, who partially understood the English language, and proceeded to the River Mosquito, where there is a considerable settlement of Indians, who here have long traded with the English from Jamaica, have adopted the British flag, which has been regularly hoisted at the house of the headman every morning. The tortoise-shell collected at this place is of the best quality.

From Banana and the Mosquito River, Mr. Roberts proceeded towards the Gulf of Darien, to the excellent harbour of Sasardee,—an Indian station, where he purchased a considerable quantity of tortoise-shell and cocoa. Turtles were abundant, and the natives raise plantains, maize, bananas, cassava, and other products.

The natives of the Isthmus of Darien are considered to be a distinct people from the Valientes and other tribes of the Rio Beling, Chrico Mola, Chiriqui, and other places to the northward. They are shorter in stature, few of them exceeding five feet two or three inches in height. They have low foreheads and rather flat, full chests, broad shoulders, and are exceedingly active; their eyes are small and dark; their cheek-bones are broad and full; the lips not very thick. They allow the hair on their heads, which is coarse, black, and often worn tied behind the head, or in queue, to grow to its natural length, but they eradicate it from all other parts of the body. Their colour is a dusky yellow. There are some instances of Albinos amongst them. The San Blas Indians are described as an active, hardy race of people, jealous of their independence, which they have hitherto strenuously maintained: they are fond and careful of their women. Some of the latter accompanied their chiefs on board Mr. Roberts's vessel. They were clothed in wrappers of blue baftas, or striped cotton of their own manufacture, reaching from the breast to a little lower than the calf of the leg. They wore a profusion of small glass beads round their ankles, forming a band of from two to three and a half inches deep, and similar bands or bracelets were worked round the wrists. Their ears were pierced, as well as the cartilage of the nose, in which they wore rings of gold or silver; the

ear-rings principally supplied by the Jamaica traders—the nose jewels seem to be of their own manufacture, being a thick ring of gold in the form of an obtuse triangle, about three-quarters of an inch in circumference. On their necks they wore fine seed beads of lively colours, and necklaces of red coral. Some of those worn by the chiefmen's wives would have weighed several pounds. Their hair, which is very long and black, was fastened on the top of the head with a sort of bodkin made of tortoiseshell. Their complexions were much clearer than that of the men. Over the head was thrown a piece of blue bafta or salemore, covering the back, breasts, and one side of the face. The deportment of these women was modest, diffident, and amiable. Their husbands being jealous of strangers, is one reason, according to Mr. Roberts, for refusing to allow Europeans to settle on the mainland. "Their trading intercourse," he says, "is always carried on at one of the numerous keys or islands on the coast, selected at the time for that purpose. Perhaps this custom may, in some measure, be owing to the necessity which they are under of guarding with great vigilance against their neighbours the Spaniards, to whom they bear the most inveterate enmity. No Spanish vessel ever fell into their power, whose crew was permitted to escape, when any of them have the misfortune to suffer shipwreck on this part of the coast—the massacre of the crew is, under every circumstance, the inevitable consequence." During one of his subsequent trading voyages to this quarter, a fine Spanish copper-bottomed schooner, of about 120 tons' burden, laden with wine, rice, maize, sugar, bricks, and jerked beef, ran aground during the night on a reef of rocks, a little to the north-east of the great Playone River. "The crew, knowing the inevitable consequence of being discovered in the morning, took to their boats during the night, and reached Porto Bello. The vessel being strong and substantially built, beat fairly over the reef, without suffering much damage. The Indians, immediately on discovering the accident, boarded and plundered her, cutting away the masts, bowsprit, &c., for the mere purpose of securing the iron works, by rendering her useless. They regretted that the crew had made their escape. The hull of the vessel was afterwards removed to Needle Key, and I used it as a hulk, by which to heave down a vessel under my command."

The forests of San Blas produce some very valuable woods, amongst which may be enumerated fustic, cedar, ironwood, ebony, brazilletto, lancewood, spars, and a variety of hard woods, well adapted for the use of cabinet-makers. The interior abounds in game of various descriptions, amongst which are the tapir, or mountain cow, the waree, peccary, gibeonite, Indian coney, antelope, armadillo, and others; also currassow, guam, coquericot, partridge, and a great variety of other birds. No rivers or coast in the world can produce a greater variety of excellent fish, or finer turtle; and the quantity seems inexhaustible. Cocoa-nut trees are never cut down or destroyed by the Indians of San Blas, and are so abundant on

all the keys, that the fruit is esteemed of little value, except on account of the oil, which the natives extract and use for dressing their hair, burning in lamps, and other purposes.

The inhabitants of this part of the coast are careful to preserve the hawksbill turtle as much as they can. They never destroy its eggs, and have a cruel method of taking the shell from its back, without killing the animal, as is done by the other tribes. They collect a quantity of dry grass, or leaves, with which they cover the turtle's back, and then setting the stuff on fire, the heat causes the shell on the back to separate at the joints. A knife is then insinuated horizontally, and the pieces are peeled from the back, care being taken not to injure the shell by too much heat, nor to force it off till the heat has prepared it for separation.

The turtle is held down by an Indian during this operation, and afterwards let loose. Great numbers of them, reduced to this helpless state, fall a prey to the numerous sharks on the coast. There have been many instances of turtle being afterwards caught which had undergone the process, and the shell subsequently formed has, instead of thirteen pieces, the usual number, been in one piece only.

Traders, who are not judges of fustic, may be cheated, by having a spurious, or bastard wood without dye, imposed upon them. Traders are also accused of deteriorating the quality of the wood, by immersing it, during their stay, in salt water, to increase its weight. These practices, together with the circumstance that a great quantity of inferior wood is cut in low, swampy places, has depreciated the character of that which is collected here.

The natives are excellent hunters and fishers. One of their modes of fishing is singular. The water on their coasts being very clear, they can easily see the fish basking, or swimming near the surface, or in the shallow places; and they kill considerable numbers, by following them in canoes, and shooting them with arrows. The women and children plant and cultivate Indian corn, cassava, plantain, and other provisions, the men cut down the wood, prepare it for sale or other purposes, and clear the ground for plantations. They are not so much addicted to spirituous liquors as some of the other Indians of the coast; and they drink chicka, which they make from Indian corn, cassava, and plantains, in preference to rum. They in general have one wife; some, who can maintain them, have four or five. Their houses are constructed at a short distance from each other. Each wife has a separate house or hut. The husband usually takes up his residence with the eldest, who considers it her duty to set the others a good example, and maintain a friendly understanding, by directing their attention to the comfort and convenience of the husband. Sometimes, but not often, they all live in one house, except during an advanced state of preg-

nancy, confinement, or suckling their children, at which season they invariably live separately.

The men of greatest consequence, next to the principal chiefs, are the Sookeah-men, who are both doctors and priests. They are supposed, by the more ignorant natives, to hold communication with an invisible spirit, and to be empowered, through his means, to foretel events. They have acquired a knowledge of the medicinal virtues of some plants, and are thereby enabled to cure wounds, and also some of the local diseases. They are deep, shrewd, and comparatively intelligent men, and, having once acquired an ascendancy among their own tribe, their fame soon extends to others.

It is asserted that they have been known to dance, in a state of nudity, in the middle of a large fire, the flames having little or no effect on their body. The effects of the fire is supposed to be resisted by some antidote, extracted from vegetable substances, the preparation of which is only known to the superior sookeahs.

Their knowledge has not extended to diseases introduced by Europeans, many of the natives having been carried off by the small-pox, measles, and other complaints for which they know no cure, and by which their numbers have been greatly diminished. On the first appearance of the measles or small-pox, which have proved as destructive to these Indians as the plague has been to the inhabitants of other quarters of the globe, they abandon their settlements, and fly to some of the numerous keys on the coast for the benefit of the air; on one of these the infected are carefully secluded until they are free from disease;—death generally puts an end to their sufferings.

The Mosquito Shore men have repeatedly attempted to acquire authority over the San Blas Indians, and much blood, in consequence, was formerly shed. The last expedition against the latter took place about forty-five years ago. The Mosquito-men, about 300 in number, were nearly all cut off in the different engagements that took place.

The country of the San Blas Indians is naturally so strong, and the lagoons and harbours so very intricate, that contrabandists, privateers, or pirates, if on friendly terms with the Indians, can always find shelter; and in consequence of the impolitic duties and prohibitions of the New Granadian government, the trade to Carthagena, Porto Bello, &c., may be superseded by the contrabandists.

CHIRICO MOLA.—On Mr. Roberts arriving at Chiriqui Lagoon, he ascended the River Chrico Mola, about twenty-five miles, to the principal settlement of the Valiente Indians; a station said to be exceedingly healthy, for the recovery of his health.

He found that the river has two mouths, formed by a small island at its entrance; the one to the westward is broadest, having only about two feet water

on the bar ; the other three feet. After passing these entrances, it is of considerable depth up to the first rapid, a distance of about twelve miles.

At this rapid the land rises high on each side, and, up to the settlement, the river is so full of falls, rocks, and rapids, that it would be totally impossible for persons unaccustomed to such places to ascend even in the lightest canoes. The Indians are obliged in the ascent, frequently to lay aside their paddles and use poles—and at some places even to haul their canoes over the rapids, which the force of the current renders no easy task—the smooth rocks and rounded stones making it difficult to find a secure footing. Between these rapids, however, there are many smooth and deep parts of the river, some of them about a mile in length, and the banks are covered by a variety of majestic trees and shrubs of the most lively colours. Above is the first Valiente Settlement. The houses are situated at a small distance from the river.

He soon received visits from several families, sometimes from ten to twenty in a group, each person bringing from fifty to eighty pounds of sarsaparilla, in large bags made of silk grass, having a large band of the same material fastened across its mouth.—These bags, when filled, appeared like baskets, of which the band formed the handle ; and they were suspended on the back of the Indian by this band across the forehead : women and children were laden in a similar way.

They also brought him abundance of fowls, some fine hogs, and a great many extremely neat bags, or purses, of various sizes, made of silk grass, and dyed of various bright colours, some of the threads nearly as fine as lace.

Scarlet, blue, yellow, and purple, were the most predominant colours ; and, when newly dyed, they appeared very bright, but did not stand the rain or weather ; these Indians possess some very valuable dyes, but do not know how to fix the colours. They also brought him some small lines from twenty to thirty fathoms in length, made of the interwoven fibres of cotton and silk grass. These they are in the habit of bartering with the fishing Indians of the coast, who use them as lines for catching turtle, &c. He gave in barter for these articles fish-hooks, glass-beads, small Dutch looking-glasses, seamen's knives, and other articles of little value.

The Indians inhabiting the coast assume a superiority over these “Montanios” or Hill people. He found the natives of the interior, harmless, inoffensive, honest in their dealings, and satisfied with whatever was given them in exchange for the commodities they brought.

Many of the people, who then and subsequently visited him, came, as he was told, from the low country, bordering on the Pacific Ocean ; having crossed the mountains about thirty miles above this village. These mountains are of considerable elevation, covered with wood to the summits, and form the natural

boundary between the Valientes, and those Indians who occasionally trade with the Spaniards.

Sarsaparilla was one of the principal articles of trade with these people; the kind which is collected in the savannahs is more esteemed than that which is brought from the mountains.

After he had resided some time at Chrico Mola, the Indians from the south side of the mountains frequently brought him Spanish money and pieces of silver, for the purchase of iron pots, cutlass blades, earthenware, and dry goods. Many of these Indians had incurred the jealousy of the Valientes, who dislike any intercourse with the Spaniards. Their quarrels on this subject have often ended in bloodshed, and the Valientes seldom approach, or trust themselves within reach of the Spanish territory.

From his first arrival at Chrico Mola, he gradually acquired bodily strength,—and he followed the example of the inhabitants, old and young, by daily bathing in the river, which is here as clear as crystal, and pleasantly cool. Alligators do not ascend higher than the first fall, so that there is no danger from them.

In less than six weeks he had purchased upwards of 5000 lbs. weight of sarsaparilla.

Having heard that the Atlantic and Pacific Oceans could be seen at the same time from the summit of a mountain about thirty miles from Chrico Mola, he proceeded to it, accompanied by an Indian. The way was nearly free from under-wood, or any difficult impediment, except ravines, which are, in some places, wide, and the bottoms and sides partly composed of large masses of rock.

On gaining the summit of the mountain, which did not terminate in any peak or cone, but was rather the continuation of a chain, or ridge of mountains, which rose higher than any of those in the immediate neighbourhood.

About 500 yards across this summit, the descent, towards the Pacific was rather abrupt; and more precipitous than on the Atlantic side. Mountains still higher appeared to the eastward in the direction of Panama and Chagres. To the north-west, an immense and continued unbroken chain of mountains presented themselves as far as the eye could reach; and, here and there, various high isolated peaks, having the appearance of volcanoes, sprung up from the chain. *He had a clear and distinct view of both seas*; many of the islands in the Bocca del Toro and Chiriqui Lagoons on the Atlantic side, were distinctly seen, but he could not perceive Quibo, nor any of the islands on the Pacific, which he thought would, if correctly laid down in the charts, have been visible. The immense forests of stately trees which vegetate on the sides of all rivers in this country, and clothe most of the mountains to their very summits, effectually prevented his tracing the course of these rivers. The country, from the spot on which he

obtained this magnificent view, presented, as it were, a map of an immense mountain forest.

When one of the Valientes Indians dies, the body is buried under the floor of the house occupied by the family; the only exceptions to this rule are, when an Indian has been poisoned by a serpent, or slain in a quarrel with one of his own tribe: in either case they are interred under a house in their provision-ground, and their implements of war, and other moveables, are buried with them; their canoe also is generally split in two, and laid over the grave. Even the plantain-walks and provisions on the grounds, immediately belonging to persons so killed are destroyed. On the death of a relation, they manifest extraordinary grief; the women beat their bosoms, tear their hair, cut their flesh, and exhibit the most extravagant sorrow. The son, if there be one, succeeds to his father's house and women. The moveables, such as canoes, hunting and fishing-instruments, arms, trinkets, &c., are divided amongst all the children. If there be no children, the eldest brother succeeds to every thing. The women have little choice in marriage: that affair being always decided by their father, or nearest male relations.

Children, of both sexes, are early taught to swim; one of their chief pastimes is in the water, to which they resort as soon as they can walk. As they grow older they are instructed to use the bow and arrow and spear; and they acquire dexterity by practising with blunt instruments upon the fowls, dogs, or other domestic animals or birds. As they acquire strength, the boys are taken to fish or spear turtle: on these expeditions they are sometimes absent, with the men, three weeks or a month; and, on returning, always divide part of the produce among their neighbours. The girls accompany their mothers to the provision-grounds; carry light burdens of wood, plantains, cassava, and other articles; grind corn, wash and prepare cotton and silk grass, and attend to other domestic duties. They, as well as the boys, bathe frequently during the day; but, from the age of six years, at which time they are generally betrothed, these ablutions are made separately, and with their mothers, who after that period seldom allow their daughters to be out of their sight until marriage, which generally takes place at the age of ten or twelve years.

When a Valiente Indian considers himself affronted or injured by one of his own tribe, he deliberately sharpens his moscheat, or cutlass; and, taking a friend with him, goes to the house of his adversary, whom he challenges to fair combat. The challenge is frequently accepted on the spot, and the duel never ends until one, or sometimes both, are killed or maimed.

They are dexterous in the use of the cutlass, both in attack and defence; it is rare to find a Valiente without deep scars on his body, particularly about the head. If the challenged party puts off the quarrel it is generally made up by

the intervention of friends. Few of them can use fire-arms with effect, but they are expert with the bow and arrow, and are good and dexterous spearmen.

They are in general courageous, possess a keen sense of honour, and continue to merit the appellation given to them by their first discoverers, of "Indios Bravos" or "Valientes." They are a taller race than those of San Blas, and may, from their intercourse with Europeans and other traders, be considered more civilised than most of the other tribes inhabiting this part of *Terra Firma*. Their hatred to the Spaniards, and partiality to the English, are remarkable; and, in point of honesty, they are far superior to the Mosquito-men, to whose king they, however, have paid a sort of tribute, or acknowledgment, annually, which they consider in the light of a gratuity, according to ancient custom, rather than an acknowledgment as subjects. On more than one occasion they have refused to pay this tribute, and about fifty years ago, a dispute took place on the subject, and the Mosquito king's uncle, with the whole of the chiefs and people who then accompanied him, to the number of about fifty men, were sacrificed.

No Sookeah-man, or priest of any kind, lived amongst them during the years that Mr. Roberts visited or resided in their country. Marriage, baptism, and other ceremonies, commonly considered religious, were performed by the elders of the settlement. They are not, however, without ideas of a future state, and an over-ruling Providence; and to any wonderful or providential escape from danger, or unaccountable preservation, they sometimes give the name of "God business."

They have also some faint idea of spirits, and of another world, where they expect to find good hunting-ground, with game and provisions.

Their houses are built generally near the banks of a river. In constructing them three or sometimes four hardwood posts are driven into the ground, at equal distances, the intended length of the house, to these is secured the roof-tree. Small posts are driven, into the earth along each side, ten or twelve feet apart; long poles or rafters are then laid upon these from the roof-tree and along the sides; the roof is covered with a species of durable palm, and the sides are covered in the same way. Sometimes the roof descends to within five feet of the ground, and the sides behind left open, without any wall. In this case they sleep on a kind of elevated platform, constructed by four posts being driven into the ground at equal distances, so as to form a square frame; a broad plank of cedar-wood forms the bottom. This bed is generally large enough for the husband and two or three wives. When the family is numerous, several of these bed-places are erected round the inside of the house, on a level with the eaves' lower side of the roof. A log of wood, notched, serves for steps to this sleeping berth.

The plantain walks of the Valientes are extensive; and, at Chrico Mola, extended several miles along the banks of the river. These walks are never ex-

hausted, as on some parts of the Mosquito Shore; a continual succession of suckers, or young plants, are always found springing round the foot of the original plant; and such is the luxuriance of their growth, that they are frequently thinned or transplanted. Cassava and Indian corn are cultivated further in the interior; for subsistence, they principally depend upon the plantain, banana, and cassava. Their method of preparing ground for a maize crop, is simple. The man who wishes the work done invites his neighbours to a chichee drink. It is then agreed by the guest to clear a piece of land. On the day appointed every man comes with his axe or moscheat, the trees and bushes are soon levelled, and the grain is loosely scattered on the ground amongst the fallen trees. This is generally done a few days before the commencement of the rainy season. The fallen branches screen the shoots from the sun, and in about five months the ears, having overtopped this covering, is ready for gathering.

After the grain has been collected, the wood is set on fire; and, with the dry stalks of the maize, burns so thoroughly as to leave merely ashes, and the stumps of the trees. The ground is then considered sufficiently cleared for agricultural purpose. The cocoa-tree grows amid every banana or plantain walk. The soil on the borders of the Chrico Mola, and other rivers emptying themselves into Chiriqui Lagoon, is well adapted to its growth; and it arrives at perfection in four or five years, with little trouble to the cultivators.

The soil about Chrico Mola is remarkably fertile; and yields in great perfection almost all the fruits common in South America, among which the mammee, sapodilla, cocoa-nut, orange grape-tree, locust, soupa (which in season is preferred to the plantain, banana, and cassava); and a variety of other delicious fruits.

The soupa, a species of palm with the trunk armed with prickles or thorns, is from fifty to sixty feet high: on the top, the leaves branch out like those of the cocoa-tree—they are pinnated—thin—undulated and frizzled toward the points. It bears several clusters of fruit, each cluster consisting of from eighty to a hundred fruit. The fruit is first green, then yellow like an apple, and grow red as they ripen. They are the size of a hen's egg, and sometimes without any kernel; the fruit is farinaceous, and an excellent substitute for bread or vegetables. The wood of the tree is extremely hard, heavy, and close-grained; it is used for bows, staves for striking turtle, and for spear shafts. The stem is so prickly that the fruit is gathered by means of long bamboos.

Nature has supplied the Valientes abundantly with the mere necessities of life; their plantations are managed with very little labour, and their woods contain abundance of game: their rivers abound in the finest fish, and their lagoons frequented by the best turtle, and fish and fowl. Formerly the clothing of these Indians was made of a sort of bark, prepared by being soaked in running water,

and afterwards beaten with a smooth heavy club into a cloth resembling chamois leather. This was formed into a square piece, six or seven feet long, and about five feet wide, with a hole cut in the centre to admit the head. Now they are often dressed in a complete European suit; or, in their own words, "true English gentleman fashion."

The wet season is not, with them, considered an unhealthy period. It is one of rest and enjoyment, during which they form parties for drinking weak preparations of cocoa, of which they take immense quantities. Their method of preparing it is simple: it is bruised, or crushed, between two stones to a consistence of paste, then diluted with warm water; and, in this state served in calabashes, containing each about a quart; some Indians drink eight or ten quarts at a sitting, which brings on a state of sleepy insensibility. At these convivialities they tell long stories, or make harangues, in a singing monotonous tone of voice, to which all listen without interrupting the speaker, however improbable the tale may be.

They sometimes from drinking chichee, a sort of wine, made from the fruit of a species of palm-tree, become madly intoxicated. This is rare amongst the Valientes and San Blas men. These drinking orgies are only indulged in on some particular occasions, such as previous to setting off for the turtle-fishing, gathering a maize harvest, a wedding, or the birth of a child.

Mr. Roberts says,—

"There may be many places on the coast better situated for trade; but, for a healthy residence, or permanent settlement of Europeans, I would prefer Chrico Mola River to any other I have seen. Domestic animals increase very fast when the least care is taken of them; a few hogs, which I procured for breeding, as also a quantity of tame fowls, increased so rapidly, that in the end I was at a loss what to do with them until the month of May, when the traders should arrive to take them, and some cows and calves off my hands.

"Mosquitoes, sand-flies, and other insects, which on the coast are so very troublesome and tormenting, are here scarcely known; and, during the whole time of my residence, I slept without being under the necessity of using mosquito curtains. Serpents, or other poisonous reptiles are equally rare, and it is still rarer that any injury is sustained from them."

CHIRIQUI LAGOON has three entrances, one from the eastward round Valiente or Valencia Point; the other from the north-west, by the Sapadilla keys; and a third by the Bocca del Toro Lagoon. The first and second entrances command a sufficient draught of water for ships of the largest class; and the lagoon is capable of containing the whole British Navy secure from all winds. There are several shoals of soft white coral in the lagoon, but all distinctly visible when the sun shines; and the water being, in general, smooth, a vigilant look out is all the pilotage requisite. At the eastern entrance is Paterson's Key, opposite to which, at the northern end of a sandy beach, and not far from the entrance of the harbour, is a cascade, falling from a rock of the height of about five feet

from the ground, forming a most convenient watering-place, as a seventy-four gun ship may lay close to it. It is superior to Water Key, which, together with Tigers' Island, Provision Island, and many other places on this coast, received its name from the old Buccaneers. The entrance to Bocca del Toro Lagoon, or Bahia del Amirante from the north-west, is narrow, yet sufficient for a vessel to work in or out; and, it has about three fathoms water in the channel; the other entrance, from Provision Island, is also a good channel, of considerable depth: the best entrances into Chiriqui Lagoon are those from the eastward.

PROVISION ISLAND has for many years been occupied by fishermen, from San Andres, and the Corn Islands, who resorted to it to barter tortoise-shell and other produce with the traders.

Mr. Roberts made many excursions to the various islands and keys in these lagoons, and found plenty of quams, curassowos, pigeons, monkeys, deer, and a variety of other game on all of them. They also produce vanilla. On some of these islands he found a small species of tiger, but not at all dangerous; the climate is considered healthy, the lagoons, notwithstanding the very heavy rains during the season, being at all times open to the sea breeze. Between Provision Island and a small island opposite to it, there is a deep Bight, called Nancy's Cove, completely sheltered from all winds, and in which the water is smooth. From this place to the north-west entrance of the port of Bocca del Toro, is about six miles; and the whole length of both lagoons cannot be less than ninety to a hundred miles.

The buccaneers and free-traders used occasionally to conceal their vessels in these lagoons, by hauling them into creeks or intricate passages, under the overhanging branches of the trees, and then by lowering the topmasts, and fixing green boughs to the yards and masts, so disguised their appearance, that it was almost impossible to discover the vessel.

Even when a discovery was made, no moderate force dared venture to attack an enemy, who, under cover of the bushes, and assisted by their Indian allies, could beat off their assailants without exposing themselves to a single shot.

The banks of many of the rivers falling into these lagoons, are now totally destitute of inhabitants; although, at one period, the country contained a numerous population of various tribes: some of them, from the apparent remains of their ancient settlements, of considerably antiquity. The Chilibeas, the Tirribeas, and Blancos were once numerous, but in consequence of their wars, and the introduction of European diseases, they are now almost extinct.

During one of the turtle-fishing seasons, Mr. Roberts fitted out a large canoe, loaded her with goods to the value of about 300*l.*, and taking two stout lads to assist him, he visited several places on the coast of the Province of Veragua, calling at Cocoa Plum Point, and the small island Escuda Veragua, off the river

of that name—both places much frequented for turtle. From thence he went over to the entrance of the Rio del Oro, the last Spanish settlement on the coast in the above-named province, where he found a party of four people stationed for the purpose of apprising the Spanish merchants at La Concepcion, a town in the interior, of the arrival of any trading vessel on the coast. Here, from two Spanish creoles, he procured, in payment of goods, several ounces of gold dust.

At the river Belen, or Belem, in the year 1502, Columbus was prevented, by the bravery of the natives, and turbulent disposition of his followers, from establishing a colony.

This river is large, and wide at its entrance; but being open to the north-west, it has a bar with no more than four feet water over it at its mouth. The country on each side of the river appeared to be very fertile, and abounding in provisions and natural products of the soil. Coclee River is of a similar character.

The whole of the coast, from Chiriqui to Chagres, is destitute of harbours for large vessels: the mouths of the rivers being completely exposed to the heavy seas which roll in from the north, north-west, and north-east, are completely barred up, and have only a very few feet water over their entrances.

From the Tiribee River to Monkey Point (Punta Chica) the last headland in the province of Veragua, the distance is not more than eight or ten miles; it is easily known by a remarkably bluff rocky islet, distant only a few yards from the mainland. The islet itself is perforated in a remarkable manner through the middle in the shape of a high imperfect arch, under which there is room for a large boat to pass.

The Rio Culebras, or Snake River, is considered the boundary between the province of Veragua and Costa Rica;—and, to the northward of this river, the Blancas, who are believed to be the fairest Indians in South America, sometimes repair, in large parties, for the purposes of hunting and fishing. They are a mild race, extremely shy, and obliged to be constantly on their guard against their enemies, the Tiribeas and others.

Between Matina and Monkey Point, the country, which is thinly inhabited, presents a beautiful appearance of hill and vale, well watered, but destitute of good harbours and headlands. The following are the names of rivers and places in this tract, viz., Rio Quemado, Point Caneta, De las Doraces, De Dios, Banana, Blanco Point, San Antonio, Lime Bight, Grape Key, Salt Creek, and the small open roadstead of El Portete.

Salt Creek is about twelve miles from Matina, which, with the small harbour of El Portete, may be called the sea-port of Cartago; the bay opposite to Matina River being nothing more than a wild open roadstead, where it is almost im-

possible to land in an European boat: Salt Creek may be distinguished by several small islands lying off the point of land at the south end of the bay, from which it is not more than five or six miles distant. This is the principal resort of the contraband traders, when their cargoes cannot be landed at Matina River. That river has its source more than eighty miles in the interior; and it is joined, at about thirty miles from its mouth, by a tributary river, where there was a fort, named Castillo de Austria; from whence, for about eight leagues, there was a road to an Embarcadero, or carrying-place, about twelve miles from Salt Creek. During the last ten years of Spanish rule, the citizens of the United States regularly, but clandestinely, visited this port every season;—one house in New York sent annually three or four fast sailing schooners to an agent at Salt Creek, who disposed of the cargo, and collected the proceeds, during the time schooners were running down the coast, trading with the Indians for tortoise-shell, copal, and other gums, sarsaparilla, tassao, &c. This may still be considered very much the character of the trade carried on.

The city of CARTAGO, the capital of the province of Costa Rica; had an estimated population, in 1823, of 37,716 souls; but, about two years after that period, it was nearly destroyed by a tremendous earthquake, which shook the whole Isthmus of Darien.

The mountain of Cartago is an active volcano, situated far back in the interior; it frequently emits fire and smoke, and is an excellent landmark to navigators—being seen, in sailing along the coast, at an immense distance.

From Matina, in proceeding north along the shore, are the rivers Vasquez and Azuelos; and to the northward of these, the Bocca de la Portuga, or Turtle Bight—at this place the finest turtle are killed annually, merely for the sake of their manteca or fat, which is melted into oil, and used by the Indians and others as a substitute for butter. Most of the fishermen, on their return from the southwards towards home, stop at this place for the purpose of procuring this oil and turtles' eggs, which latter are dried in the sun to preserve them; and in this way many thousands of turtles have been annually destroyed or prevented from coming to maturity.

During the months of April, May, June, and July, the green turtle comes in from various keys, and places a great many leagues distant, to several parts of the Mosquito Shore, especially to the sandy beaches in the vicinity of Turtle Bogue, to deposit their eggs. At this season the sea is covered with what the fishermen call thimbles—a small blubber fish, in shape not unlike a tailor's thimble; these, and a sort of grass growing at the bottom of the sea, is their principal food. The turtle has large lungs, and cannot sink deeper in the water than five or six fathoms, being obliged to come frequently to the surface for air. The male and female remain together about nine days, during which time the female feeds and keeps in good condition; but when they separate the

male is totally exhausted, and unfit for use as food. Some time after, the female crawls up the sandy beaches, and prepares to lay her eggs; she makes a circle in the sand, then digs a hole, about two feet deep, in which she deposits from sixty to eighty, covers them up, and goes off, generally before daybreak. About the fifteenth night afterwards she returns, and deposits the same number near the same spot. The young turtle are hatched in about thirty-two days, and immediately find their way into the sea. Both the hawksbill and loggerhead turtle keep the same season; but, if a trunk turtle, which is of immense size, and remarkably fat, is found dead on the beach, neither kind will lay their eggs within a mile of the place, for which reason trunk turtle is never killed.

The handle of the spear with which the Indians *strike* turtle is made of very hard wood; the head is a triangular-shaped piece of notched iron, with a sharp point; a piece of iron is joined to this, which slips into a groove at the top of the spear handle, and has a line attached to it which passes through eyes fastened in the shaft of the spear, to which a float is fastened. The Indian, when near enough, raises the spear over his shoulder, and throws with such skill, that it takes a circular direction in the air, and lights, with its point downwards, on the back of the turtle, penetrating through the shell, and the point becoming detached from the handle, remains fastened in the animal's body; the float shows on the surface of the water which way the turtle moves; it is then soon brought up, and secured by means of the line attached to the spear-head.

The turtle has many enemies which destroy both itself and its eggs;—such as the racoon, squash, fox, &c. The congar, or American lion, and a species of black tiger, will also watch the turtle when coming to lay its eggs, seize and haul it into the woods, and there devour it.

Pursuing the voyage from Turtle Bogue, we come to the Rio Colorado. Its entrance is wide, but there is too little water on the bar to admit ships of any size, though sufficiently deep inside. It takes its name from the muddiness of its waters, which discolour the sea to a considerable distance; and, in the rainy season, its entrance may be easily found on the coast, by this discoloration, and by the extensive green downs to the south.

A communication between it and the great River de San Juan (running out of the Lake of Nicaragua), takes place at a distance of about thirty miles from its mouth, by the branch Serapini. Its course in the interior is nearly parallel to the River San Juan, and is said to be joined by many streams having their sources in the mountains to the southward of the Lake of Nicaragua. It enters the ocean about ten miles from the harbour of San Juan; but, in most charts, it is erroneously laid down at a much greater distance to the southward.

The harbour of SAN JUAN DE NICARAGUA is the best for large vessels, on the whole range of coast between the Bocca del Toro, and Cape Gracias à Dios—to which latter it is also superior in not being exposed to southerly winds.

There is a sufficient depth of water, and room, at the upper part, for fifteen or twenty ships of the largest class, besides smaller vessels; which, when there, would be completely land-locked.

Many of the fishermen and Indians, on their return from the southern fishing grounds, call in this neighbourhood, for the purpose of taking *manatees* in the river, and in a creek at the upper end of the harbour. Many of these fishermen remain to cure the meat, on the sandy point at the entrance of the harbour, without being molested by the Spaniards. This animal may be considered the connecting link between quadrupeds and fishes; it has the forefeet, of the former, with the tail of the latter—spreading out in a horizontal direction like a large fan. Beneath the skin, which is hard and thick, there is a deep layer of sweet fat. The meat in its thickest parts is streaked in alternate layers of fat and lean, and is excellent food. Persons afflicted with scorbutic, or scrofulous complaints, are soon cured by using it freely; the blood is said to become purified, and the virulence of the complaint, thrown to the surface of the body, quickly disappears. The manatee is extremely acute in its sense of hearing, and immerses in the water on the slightest noise; it feeds on shoots of grass growing on the banks of the rivers, and will rise nearly two-thirds of its length out of the water to reach food. It is found only in the solitary, and least frequented creeks and rivers; the male and female are generally together; their usual length is from eight to twelve feet, and it weighs from 500 to 800 lbs.: some of them are, however, much larger, weighing from 1200 even to 1500 lbs. The Indians generally creep up to them early in the morning, when they are feeding, and kill them with a harpoon; but if the least noise is made, they immediately sink and escape.

Between the Rio de San Juan and Point de Gorda, a distance of between thirty and forty miles, the coast forms a large bay, into which flows the Rio Trigo (Corn River), Indian River, and several smaller streams, some of which, in most of the charts, are erroneously laid down as having communication, in the interior, with the River San Juan by Indian River.

Mr. Roberts says,—

“I never could trace the report to any authentic source; neither in the passage up and down the Rio San Juan, could I discover such a communication. Between Corn River and Point de Gorda, is Grindstone Bay, with anchorage in from four to five fathoms water. At a short distance from the coast, the country here rises considerably; and from the neighbourhood of San Juan to Bluefields, it is occupied by the Rama Indians, whose principal settlement is at Rama River, or Rio de Punta Gorda, a noble stream, which is said to have a course of about eighty miles, or upwards, from the interior, through a fertile country, and passing between two mountainous ridges at a short distance from the sea-shore.”

The plateau of Costa Rica extends between 9 deg. 20 min and 10 deg. 20 min north latitude. The elevation of the plateau is estimated at more than 2000 feet above the sea. In winter the mercury in Fahrenheit sinks to the freezing point. High peaks rise in the plateau to more than 10,000 feet above the sea. Most of them are or have been volcanoes.

Towards the Pacific and the Gulf of Nicoya the descent is gradual from the table lands. The descent towards the east coast is abrupt, and terminates about twenty miles from the sea: the intermediate district being occupied by a low and level country, covered with forests, and subject to inundations. The numerous rivers which descend from the eastern side of the table-land of Costa Rica and Veragua bring down during the rains more water than can be carried off by the rivers. The whole plain, with the exception of a few spots, is consequently laid under water, to a depth varying from five to thirty feet. Through this plain, and parallel to the coast, the Canal de la Baya is said to be navigable to a great extent, the places where it is interrupted by shallows not being numerous. The greatest part of the eastern plain of Costa Rica is occupied by native tribes.

On the Pacific the Gulf of Nicoya has a broad open entrance, growing narrower further inland. It is about seventy miles long, contains good harbours, and several islands, near which pearls are fished, and a shell-fish found which yields a bright red dye.

The PLAIN OF NICARAGUA extends north of the table-land of Costa Rica: towards the Mosquito coast, and is nearly a flat; to the west it is more undulated. A continuous range of hills, connected with the north-western part of the table-land of Costa Rica, traverses the plain in a north-west and south-east direction towards the Pacific. Where these hills approach the Lake of Nicaragua there are several volcanoes. Farther to the north-west between the lakes of Nicaragua and Managua and the Pacific, the hills are low, and disappear opposite the north-western extremity of the Lake of Managua: they are succeeded by a low and level plain, about ten or twelve miles wide. On the north volcanoes rise behind the Bay of Conchagua. The northern part of the Plain of Nicaragua is little known.

North-west from Nicaragua is the Lake Managua. In the middle of this lake stands the conical-formed island of Monotombito. On the north-western shores of Managua rises the volcano of Monotombo, which usually sends forth smoke.

The Plain of Nicaragua is hot throughout the year. It is covered with large forests of remarkable luxuriance. Scarcely a day passes without rain, especially near the shores of the Atlantic, where the rain often descends in torrents. In the volcanic country, the climate is less wet and more healthy.

Cacao, indigo, rice, Indian corn, bananas, and cotton, are cultivated in this plain. Mahogany, cedar, and pine abound in the forests. East from Lake Nicaragua are extensive pastures, on which multitudes of cattle, horses, and mules are reared, a considerable number of which are sent to the northern countries, as well as hide, and cheese of an indifferent kind. On the western coast, pearls and mother-of-pearl shells are taken.

CHAPTER VII.

OBSERVATIONS ON THE CONSTRUCTION OF A CANAL BETWEEN THE ATLANTIC AND PACIFIC OCEANS.

As far back as the final conquest of Mexico by the Spaniards, the uniting of the waters of the Atlantic with those of the Pacific, was projected. Cortez first suggested the bold plan, which political and moral difficulties, more than physical obstacles, have, hitherto, prevented even the attempt at execution.

Three parts of the great Isthmus have each of them had their advocates as superior to the other two. The Isthmus of Tehuantepec, or the narrowest part of Mexico,—that of Panama,—and that of Nicaragua.

A survey of the Isthmus of Tehuantepec was executed in the years 1842 and 1843, under the direction of the engineer, Signor Gaetano Moro. A long report was drawn up by him in which he states that,

“On accepting the direction of the scientific commission with which I have had the honour to be intrusted, one of the first points to which I directed my attention was the investigation of all the former data upon the subject.

“With the celebrated Hernando Cortes originated the idea of a communication by this isthmus between the two oceans. Nevertheless I am not of opinion that Cortes contemplated the opening of a canal, for although it is observed in the work of Lorenzana, that ‘Cortes had studied mathematics,’ and that for more than a century the construction of locks had been practised in Italy, still their use was but of limited application, and on so small a scale that it is not probable they had much engaged the attention of Cortes.”

With respect to the Tehuantepec scheme, much stress is laid on the navigation of its chief river :

“Towards the end of the seventeenth century, Dampier, speaking of the Coatza-coalcos, said—‘This is one of the principal rivers of this coast ; it is not half the breadth of the Tabasco river, but deeper. Its bar is less dangerous than any on this coast, there being fourteen feet of water, and but little sea : within the bar there is much greater depth, and a bed of soft oase ground.’ * * * * ‘This river hath its rise near the South Sea, and is navigable a great way into land, especially with boats or small craft.’

“The oldest amongst the documents of most importance is the narrative of a voyage of discovery which the engineer, Don Augustin Cramer, governor of the castle of San Juan de Ulua, performed in 1774, by order of the viceroy, Don Antonio Maria Bucareli.

“After his arrival at the isthmus, by the Gulf of Mexico, he observes :—‘The bar of the river Coatza-coalcos has on it, at half-tide, twenty-four palms of water, excepting a very small portion of its length, on which there are only eighteen palms.’”

Signor Moro proceeds and says—

“These soundings correspond with those taken on the first survey, and afterwards by me ; for which reason, and as frequent soundings taken by the present pilots during the last thirteen years agree with them, it may be inferred, that the said bar is permanently in the same state, or that if any variation occurs it is so inconsiderable that it has escaped notice.

“After passing the bar the river is six to eight fathoms deep.”

Cramer continues his narrative, briefly describing, but with admirable exactness, the course of the river up to Mal Paso, and demonstrates the facilities which the country presents for making a good road from this point to Tehuantepec, concluding with the following observations:

"The river courses, with the mountain chain interrupted between Santa Maria Petapa and San Miguel Chimalapa, and the evenness of the grounds, plainly indicate that it would not be a work of great difficulty, nor excessively costly, to effect a communication between the two seas across this isthmus. In the supposition that the waters of the rivers Almoloya and Citune were held back, a canal might be opened to join them with those of the San Miguel or Chicapa, the course of which into the Pacific Ocean, by the bar of San Francisco, passes by the Venta de Chicapa, and from this spot forwards there are no further difficulties, because it is one perfect plain as far as Tehuantepec."

It was with reference to these results that Baron de Humboldt, after having very properly asserted that until then "the topography of the Isthmus of Tehuantepec was quite unknown in Europe," adds, "we cannot doubt that this point of the globe deserves no less attention than the Lake of Nicaragua."

In 1820, Robinson, speaking upon the same subject, writes, "We will now proceed to examine another (route for a canal) which, although it be deficient in some of the natural advantages of Costa Rica, still possesses others of so important a character as to render it almost doubtful to us at which of the two places the desired communication ought first to be opened."

And, speaking of the Coatzacoalcos, he adds, "it is the only port in the Mexican gulf where vessels of war, and others of a large size, can enter, and is far superior either to Pensacola or Espiritu Santo. There are at all seasons on the bar, at the mouth of that port, twenty-two feet water."

In the year 1824, the state of Vera Cruz and the federal governments appointed each a commission to survey the isthmus: the former chose Don Tadeo Ortiz, and the latter selected Colonel Don Juan de Orbegozo of the general staff.

The attention of Ortiz was specially directed to colonisation, and the cultivation of these fertile districts, upon which he enlarges with much enthusiasm. He also proposed to render the Coatzacoalcos navigable to the confluence of the Malatengo; and further to construct a road from this point to the Pacific, passing through the Portillo de Tarifa, the Venta de Chicapa, and the lagoons.

The bar of the Coatzacoalcos is said by him "to be permanent and constant, forming two canals or channels; that to the left or the west has on it in the rainy season (that is, from the beginning of June to the end of February) three and a half fathoms of water, or twenty-one feet, these being increased to twenty-three at high tides. That on the right or to the east, has two and a half fathoms, or fifteen feet, and both during the dry season lessen three or four feet, the principal channel maintaining itself at not less than eighteen feet, except perhaps under extraordinary circumstances. When a vessel would effect an entrance, with a view only to greater security, the fifteen feet channel should be preferred, because it has less current in it, and is probably wider, and because, when the sea-breeze blows hard, the currents are rapid in the great channel setting from east to west, and without taking a pilot it would be difficult, if not dangerous, to be entered by vessels of great draft of water.

"Since the direction of the channels is from north to south, we are of opinion that vessels can enter with the wind from north, north-east, and the easterly and southerly monsoons, by keeping to the wind. The prevailing winds offer no difficulty with the same precaution, only attending to the currents, which as before said, run with rapidity from the east to the west, and might cause vessels to be stranded. However, there are pro-

bably some periodical variations to the phenomena, which mariners would be the most competent to appreciate for their guidance.

"The departure of vessels by both channels cannot of course take place with the above winds, but easily with those from the south and west, and off the land. The latter of which almost every day prevails, at least during the rainy season, from after midnight till eight or nine in the morning, when the sea-breezes commence, on which account vessels should proceed to sea after five o'clock, A.M., until seven, but not later than eight, which is allowing sufficient time for vessels to be beyond the danger of drifting into the dangerous iron-bound bay, which is formed by the ridge of San Martin, running out to a promontory."

These difficulties for the entrance and exit of vessels, would be obviated by steam-tugs at the mouth of the harbour.

The survey of Senor Orbegoza was made contemporaneously with that of Senor Ortiz, but he admits that he was in want of many things, and that on this account the results of his rapid examination must be defective under the unfavourable circumstances in which he was placed.

Senor Orbegoza found, as well as Senor Ortiz, that it would be both easy and advantageous to render the Coatzacoalcos navigable as far as the confluence with the Alaman (or Malatengo); and from this point he proposes a carriage-road to be made as far as the lagoons, passing by the Chivela instead of by the Portillo de Tarifa, as proposed by Ortiz.

Signor Moro and his assistants, well provided with proper instruments, arrived at Tehuantepec on the 28th of May, 1842. The journey from Mexico had occupied nearly a month, and the roads were so bad that almost all the instruments had been more or less injured.

"In the description of the Coatzacoalcos, given by Captain Robles, I have not found any thing that does not agree with my own observations and notes, excepting the width of 700 metres attributed to the river near its mouth, where it is widest. Judging from sight only, I had supposed it to be 500 at the utmost; but as Messrs. Robles and Gonzalez measured that distance by means of a micrometer, it is probable that my calculation was incorrect. Besides, this question, after all, is quite insignificant, and I only mention it that the report of our operations may be as correct and accurate as possible."

The following report is literally the same as that which was forwarded by Captain Robles after his exploration:—

The river Coatzacoalcos, according to the report of Captain Robles, takes its rise in the unexplored part of the Sierra Madre, and the highest point in its course visited by Signor Moro, was at its confluence with the Chimalapilla, from whence he examined it to its mouth in the Gulf of Mexico, situated in 17 deg. 8 min. 30 sec. north latitude, and 94 deg. 17 min. west longitude from Greenwich.

The Chimalapilla flows into the Coatzacoalcos on its right bank, seven kilometres, about four miles and one-third English, to the south-south-east of the village of Santa Maria Chimalapa. At this confluence it is 119 metres,* or about 396 feet above the level of the sea.

* The metre is equal to 3 feet, 3,371 inches.

The kilometre is equal to 1093, 6389 yards.

1 English mile is equal to 1609 3-10 French metres.

1 English mile is equal to 1760 English yards.

On the same side, and at a short distance below the Chimalapilla, is the confluence of the River del Pinal, so called because it flows through mountains on which pine-trees were cut by the Spanish government and sent to the Havannah for the masts of large ships. This part of the Coatzacoalcos is still called the River del Corte (of the cutting).

As far as the confluence with the River del Milagro, which joins on the left at two kilometres and a half to the west-north-west of Santa Maria, the Coatzacoalcos flows through a deep ravine, with a descent of forty metres in the space of nineteen kilometres, that is 0.21 metres in every 100 metres. "The mountains which border the channel are at first very high and precipitous, but gradually lowering and softening in their character as the mouth of the Milagro is approached, they then appear only as hills of moderate elevation, and the river has changed from being a rapid torrent, in which the rafts could with difficulty float, into a quiet stream, with only occasional rapids of small extent. The rocks on the banks of the river are of sandstone, calcareous spar, and slate, although this last but rarely occurs. The limestone is excavated by the river, which appears to pass under the ruins of a bridge."

On small patches, on the borders of the river, the Indians of Santa Maria plant maize, tobacco, and cocoa; some of these tracts of land are only accessible on rafts, and others only by craggy pathways.

Beyond the confluence of the Milagro, the river previously running from east to west, flows towards the south-west as far as the junction of the Escolapa.

From the Malatengo to the mouth of the Sarabia, the depth is generally from one-and-a-half to two-and-a-half metres, and sometimes even five metres deep, or from about five to sixteen feet.

Mal Paso has a strong rapid a little below it formed of various ridges of calcareous spar and granite, and for a distance of about 180 metres, or about 200 yards.

After the junction of the Sarabia the hills are inconsiderable, and nearly disappear a little below the River Jumuapa (or de la Puerta); the rapids are less frequent, and the last, called the Suchil, occurs before reaching the mouth of the River Jaltepec.

The rivers Sarabia, Jumuapa, and Jaltepec, flow into the Coatzacoalcos from the left bank, and the Chalchijapa the right hand.

The course of the Coatzacoalcos from the confluence of the Malatengo to that of the Jumuapa is from south to north; then from north-west until it meets the Jaltepec; and thence to the bar about north-east. The whole length of the Coatzacoalcos, from the mouth of the Malatengo to the Sarabia is thirty-five kilometres; from the Sarabia to the Jumuapa, twenty-seven kilometres; from the Jumuapa to the Chalchijapa, thirty-six kilometres; and to the Horqueta, sixty-five kilometres more, being a distance of 163 kilometres, or about 110 English miles between the Malatengo and the Horqueta.

The banks, after leaving the hills, are not steep, and generally from three to five metres high : they are occasionally covered by the floods. At some few places, the *cerritos*, or hillocks, are from twelve to twenty metres high, and are formed of clay.

Where these low and sloping banks occur, the river spreads laterally, and the slowness of the current, after the confluence of the Jaltepec is scarcely apparent, the depth of the stream does not therefore increase; and during the dry season, the shoals are covered only by half a metre, about twenty inches, of water. These shoals are formed of sand and gravel. Those of any extent are, the one commencing below Tecolotepec, which occupies the greater part of the bend of Cascajal; that between the River Naranjo and the brook Churriagao; that of Cuapinoloya, between the island of this name and one a little lower down; and lastly, that of Horqueta, obstructing the entrance of the two branches of the river which divide at this point.

These branches unite after having formed the Island of Tacamichapa. The one to the west is longer and narrower than that to the east called Apotzongo. The length of the first is fifty-five kilometres; its width between ninety metres and 100 metres, or about twenty metres to thirty metres less than the river was before its separation, and the depth is above four metres. Several streams fall into it. In the west there occurs the Paso de la Cienaga, which is only two leagues distant from the village of Jaltipan; and in this same branch is the pass of Blancos, at a distance of twenty-one kilometres from the town of Aca-yucam, the capital of the district.

The Apotzongo, or largest branch, is forty kilometres long, and on its right bank, twenty-nine kilometres from Horqueta, is the village of San Miguel de los Almagres (or Hidalgo-titlan), the first inhabited place met with coming down the river. Below this point the water is constantly six metres to seven metres deep; but a little above Los Almagres, between the strands of Mistan-grande and Gaviota, it is interrupted by a large shoal.

Below the re-joinction, the Coatzacoalcos receives from the right the streamlet Ishuatepec, the stream of Otopa, and the River Coachapa, the mouth of which is sixteen kilometres from the lower end of the Island of Tacamichapa. The source of this river is unknown, and the district it traverses is a desert; it has been ascended in canoes for twelve days, which is the same time as that occupied in going up from the bar of the Coatzacoalcos to the pass of Sarabia, and schooners have also sailed up it to a sugar plantation twelve kilometres above the entrance. Three leagues higher up, it receives the river Coachapa, into which flow the waters that leave the Coatzacoalcos at Cascajal. The stream Otopa flows from some small lagoons which yield salt.

Seven kilometres below the confluence of the Coachapa, and on the opposite

shore, is the village of La Fabrica, or Milan-titlan; and at seven kilometres more below this, the River Uspanapan joins the Coatzacoalcos from the right.

Half-way, between the River Coachapa and Mina-titlan, on the left bank in front of an islet, are the creeks Tacojalpa, Ojozapa, and Cuamecatan, a place where the pine logs for the arsenal at the Havannah were formerly brought for exportation.

Of the villages founded by Don Tadeo Ortiz, only Mina-titlan and Hidalgo-titlan now exist.

The Uspanapan is the most considerable tributary of the Coatzacoalcos; its course is broad, flowing through an uninhabited country; its sources are unknown, but generally supposed to come from a range of mountains, often visible to the south-east from the upper part of the Coatzacoalcos. This range has the reputation of being rich in gold and silver minerals, and has been explored by expeditions, which ascended the river in canoes for sixteen to eighteen days, and some are said to have done this even for twenty-six days. On the banks of this river, at thirty-eight kilometres from its mouth, a Mr. Baldwin of Mina-titlan built a schooner a few years since.

Below the Uspanapan, near Paso Nuevo, the high road runs, leading to Tobasco. At sixteen and a half kilometres below Uspanapan, and eight and a half kilometres from the bar, from the left, the confluence River Tierra Nueva, or the Calzades, flows in, and is the channel by which the Coatzacoalcos unites with the River Huasuntan, which empties itself into the sea by the Barrilla, not passable for vessels of any size.

The banks of the river here are very low, frequently flooded, and there are many creeks.

The depth of the Coatzacoalcos, from the junction of the branches which form the Island of Tacamichapa to the mouth of the Coachapa, is eight metres, rather more than four and a quarter fathoms; and from this to the bar, not less than ten metres to twelve metres, or four-and-a-half fathoms to six-and-a-half fathoms. Its breadth, where narrowest, is from 120 metres to 150 metres; and in some places below the mouth of Tierra Nueva, it is nearly 7000 metres. As far as the Island of Tacamichapa, a distance of fifty-five kilometres (thirteen Mexican leagues nearly, or rather more than thirty-four English miles), or at least up to the confluence of the Coachapa, the Coatzacoalcos is navigable in all seasons and for every class of ships, forming a convenient as well as a most secure harbour. Schooners might ascend as far as Horqueta by the Mistan branch and to Hidalgo-titlan, and higher by that of Apotzongo.

From the battery on the left entrance of the river, the channel is to be seen through the breakers on the bar, which is said never to vary its position. Signor Moro says:

"We know well that there is a sufficient depth of water for large ships (since but

a few years ago two large French vessels with colonists had entered the channel), we examined it ourselves in an open boat, going out to the distance of 3000 metres, where we found fifteen metres water with a rapidly increasing depth. The shallowest water we found on the bar was 6.2 metres, and we were not certain that we had gone over the deepest part of it.* A North American pilot, who resides in the establishment of Mr. Baldwin, assured us that he had many times crossed the bar, and that he had never found less water upon it than twenty-one English feet, equivalent to 6.4 metres. This account nearly agrees with our own observation, and confirms the old opinion that the bar does not shift, a circumstance easily explained, since the current of the river is slow, and the tides are almost imperceptible at its mouth."

In the vast forests which cover the shores of this river and its tributaries, excellent ship-building timber, as well as dye-woods, are to be found in profusion; the principal trees seen are the tall pine trees of the Sierra de Chimalapa; the large cedars along the river, especially above the stream of the Perlas; superb mahogany, and other hard and close-grained trees, such as *javiques*, *huayacanes*, *macayos*, and *paques*, from the latter of which crooked timbers were cut in the time of the Spanish government for vessels of the largest burden.

The abundance of durable ship-timber which grows on the borders of the river,—the convenience and security of the port,—the facility of defending its entrance by batteries, all combine to render *the Coatzacoalcos the fittest place in the Gulf of Mexico for the establishment of a dépôt*. These advantages were suggested to the Spanish government by the engineer Cramer, in the year 1774. In 1778, another engineer, Don Miguel del Corral, submitted to the viceroy a plan for the construction of an arsenal, with two slips for vessels of every size, and a fort to defend the entrance of the river.

M. Moro says,—

"The various plans which I am about to submit, are formed on the supposition of Coatzacoalcos being rendered navigable as far as its confluence with the Malatengo, and and the Bocca barra of San Francisco fitted for the admission of large vessels. Both these ends are, in my opinion, attainable without having to overcome extraordinary difficulties."

Of the five projects of Signor Garay and of Signor Moro, the last is that which they decide as the best. After having conveyed by a trench to the immediate neighbourhood of Tarifa, as a summit level, the waters of the Ostuta and Chicapa, the next consideration would be to take advantage of the beds of the rivers, which from that point flow toward both oceans. The stream of Tarifa, and the rivers Chichihua and Malatengo, might be rendered navigable, or followed on the one side, and on the other the Monetza and the Chicapa.

The commissioners say they "do not pretend to have indicated the *only* means of effecting the desired canal transit, much less do they flatter themselves of having proposed the best, and only hope to have been the means of showing the practicability of the undertaking."

* "When we reached the greatest distance from the land, the rusty shanks of the rudder of our boat broke, and this compelled us to return immediately, without taking any other soundings, as we had intended."

"ESTIMATE OF EXPENSE.—Dutens, speaking of the Caledonian Canal, which he visited before its completion, observes, that 'in a great undertaking of this kind it is impossible to pre-estimate the cost of every part.'

"If in Europe, where it is comparatively easy to obtain correct data in these matters, it is considered venturesome to name beforehand a sum as the probable cost of an undertaking of this nature, it must necessarily be more difficult to do so in the present case, from the want of the requisite particulars. However, by making use of proper investigations, and tending to over-estimate the expense rather than to diminish it, I trust to come near the truth; nor is it possible to expect more in our present disadvantageous position.

"It would be an error to suppose that every portion of the work must, in our case, cost more than it would in Europe. The prodigious quantity of timber of the best quality which the projector is authorised to use at pleasure, in virtue of the grant made to him by government, and which lies profusely in every part through which the canal would pass; the excellent kinds of building stone, the lime, bitumen, clay, and all other necessary materials, which nature seems to have taken pleasure in scattering in the most convenient spots; and, lastly, the ground and the waters, the acquisition of which occasions often considerable expenditure, and which, in our case, if it did occasion any at all, would be so trifling as not even to be worth mentioning, are all advantages in favour of our undertaking, and which very few of the same kind in Europe could easily command.

"The canal, which I have taken as a model, is the Caledonian, the dimensions of which appear to me sufficient. To alter them much would occasion a considerable increase in the expenditure, perhaps without a suitable compensation, whilst the alteration required in the dimensions of some of its parts for the admission of steamers destined to a transatlantic navigation, would not make it much more expensive.

"Each lock of the Caledonian canal cost, upon an average, 200,000 francs, and therefore the whole twenty-seven amounted to five millions and a half.

"Selecting the proper ground, the declivity of the proposed canal is:

From the table-land of Tarifa to the Pacific 200 metres.

From the same point to the mouth of the Malatengo 160 "

"Giving to it a number of locks proportionate to that of the Caledonian canal, there would be required:

On the side of the Pacific 89 locks

On the side of the Atlantic 72 "

Total number of locks 161

But he reduces this number to 150.

"The longitude of our canal would be eighty kilometres, or nearly forty-nine miles and three-quarters.

"The trench, intended to convey to Tarifa the united waters of the Ostuta and the Chicapa, would be about twenty-five kilometres in length, or about sixteen miles and an eighth, and we will give to the section of its excavations forty square metres of surface. We will take ten francs as the cost of excavating a cubic metre of ground according to what is actually paid in Mexico and the United States for a similar work in soils analogous to that of the isthmus.

"The trench necessary to join the Ostuta to the Chicapa might be five kilometres in length at the utmost, and allowing for unforeseen obstacles in this part of the country on account of the nature of its rocks, we will suppose it to cost three millions of francs.

"Lastly, let us apply four millions more to regulate the course of the Coatzacoalcos and to excavate the lakes and the Bocabarra.

"Then, summing up the preceding calculations, the total amount of the work will be found to consist of the following sums:

Cost of 150 locks at 200,000 francs	30,000,000 francs.
„ 80 kilometres of canal at 475,000 francs	38,000,000 „
„ 25 kilometres of trench, at ten francs per cubic metre	10,000,000 „
„ 5 kilometres of trench at fifteen francs	3,000,000 „
Regulation of the Coatzacoalcos, lakes, and Bocabarra	4,000,000 „
<hr/>	
Total cost	85,000,000 „
Or sterling	£ 3,400,000

Other estimates have since been made, which calculated the expense at 20,000,000*l.* sterling.

DESCRIPTIVE SKETCH OF THE ISTHMUS OF TEHUANTEPEC.—Robinson, who examined the locality, says—

“If, on a topographical survey of the isthmus, it shall be found practicable to cut a canal, there is no place where such an undertaking could be accomplished with such ease, as in the province of Oajaca. In its boundaries are comprehended a great part of the Isthmus of Tehuantepec. Its salubrity is unequalled on the American continent; even its shores on the Pacific Ocean appear exempted from the usual diseases which afflict the inhabitants of the Atlantic and South Sea coasts.

“The population of Tehuantepec are among the most active and healthy race of Indians we have ever seen, and the cutting of a canal through such parts of the isthmus, as an accurate survey shall show to be fittest for that purpose, could be performed with the greatest facility by the inhabitants of Oajaca.”

Mr. Michel Chevalier, who lately visited America, speaking of the isthmus, in one of his recent publications (*Revue des Deux Mondes*, January 1st, 1844), says :

“The exploration of General Orbegozo, confirmed the presence of a magnificent vegetation in the isthmus, which proves the fertility of its soil. Even previous to the voyage of Humboldt, the beautiful forests of Tarifa had attracted the attention of the court of Spain. The fertility of the extensive plain of Tehuantepec was also ascertained, no less than the healthfulness of the country at some distance from the sea. Besides it being well known that the isthmus was once densely populated, there seems to be no reason why it could not be so again.”

During the long sojourn of the commission, under Signor Moro, in the isthmus, they, with their numerous attendants, had often to undergo severe toils, and were frequently exposed to the inclemencies of the weather, but none of them experienced any illness.

The Isthmus of Tehuantepec is comprised within the Mexican Republic, and forms part of the departments of Oajaca and Vera Cruz. According to the official reports, published by the Mexican government December, 1841, as a basis for the elections, the former department contained a population of 500,278 inhabitants, and the latter 250,380.

The boundaries of these two districts are not yet definitely settled.

This undefined boundary is a natural consequence of the unsettled state of the country. The coasts of the isthmus are the only inhabited portions, and they are separated from each other by an immense forest.

The southern division in the department of Oajaca, or Oaxaca, is naturally

divided into two sections. The first occupies the plain which extends from the Pacific Ocean to the foot of the Sierra, and the second comprises the Sierra.

Politically, the southern districts of the isthmus constitute the greater part of Tehuantepec, and comprise twenty-four municipalities; the town of Tehuantepec, which the Spaniards called also Guadalcazar, is the head of the district, and the residence of a prefect, a judge, a military commander, and a parish priest. Juchitan and Petapa are the heads of two sub-districts with their respective sub-prefects.

Ecclesiastically this division is dependant on the Bishop of Oajaca, and in addition to the parish of Tehuantepec has five rectories.

The whole of the southern territory of the isthmus is estimated to contain about 31,000 inhabitants.

This population is composed of Europeans, Huaves, Zapotecos, Mijes Soques, and Zamboes.

The *Europeans*, constitute an insignificant number of the population.

The *Huaves* are in all little more than three thousand, and occupy the four villages of the coast called San Mateo, Santa Maria, San Dionisio, and San Francisco.

These natives differ materially in their aspect from the other inhabitants of the isthmus. They are robust and well-formed; some among them are intelligent, but the majority are grossly ignorant.

The Huaves of both sexes are generally in a state of almost complete nudity. Their industry consists of little else than fishing: with the produce of their fisheries, however, they carry on some trade. Not possessing vessels to venture into deep water, they only frequent shallow places such as marshes, and the margin of the lakes and of the sea. Although the Huaves are chiefly fishermen, very few among them know how to swim.

The *Zapotecos* constitute the greater part of the southern population of the isthmus, almost exclusively,—sixteen villages out of twenty-four. According to a manuscript obtained by the secretary of the commission, “Montezuma, Emperor of Mexico, after subjugating the Huaves, proceeded to the conquest of Guatemala, but whilst he struggled with the difficulties of the war, Cosijoesa, King of Teozapotlan and of the Zapotec nation, assisted by the King of Misteca, drove the Mexicans away, took possession of Tehuantepec, and maintained the Huaves in subjection.

“Although Cosijopi did not offer any resistance to the Spaniards, the Zapotecos opposed their progress towards the interior. Cortes, speaking in one of his letters of two provinces which he intended to conquer, says:

“The people of one of them are called Zapotecos, and that of the other Mijes, which provinces are so rugged that they cannot be traversed even on foot, since I have

twice sent troops to conquer them, and they have not been able to succeed, these people being very strong and well-armed, and the country almost impassable."

The Zapotecos are said to maintain the fame for valour which they have always enjoyed.

The natives of Tehuantepec are in civilisation superior to those of any other part of the republic. Moro says he "found them intelligent, industrious, docile, and joyous.

"In point of personal appearance the Tehuantepecans are vigorous, and of a pleasing aspect, and I may say, that of the Indians with whom I am acquainted they are perhaps the only people who possess what may be called a *fair sex*."

"It appears evident to me that these qualities are not inherent to the Zapotec race, but a consequence of their admixture with the Europeans; for I have observed that the Zapotecos, who inhabit the mountains, and the valley of Oajaca, are similar to the natives of the rest of the republic, and bear no resemblance whatever to those of Tehuantepec, among whom there are many with light hair, and a complexion comparatively fair.

"It is well known that Cortes had collected a great number of Spaniards in the Isthmus, which was his favourite spot. The women of Tehuantepec enjoy some celebrity in the republic for their charms; and the predilection which they show towards the Europeans, together with a rather over degree of sociability, render this supposition very probable. While speaking of the women of this part of the isthmus I will add, that they are also noted for their graceful carriage, and the regularity of their features: their gala-dress is picturesque, rich, and elegant, as well as the head-dress which they generally wear."

The Zapotecos have some branches of industry. In Tehuantepec there are bakers, carpenters, smiths, tinkers, silversmiths, tanners, shoemakers, saddlers, and as the secretary of the commission observes, "every family, whatever may be their circumstances, manufacture the soap necessary for home consumption." The clothes woven by the women from wild silk and cotton are really admirable, particularly considering the very imperfect instruments which they possess for the purpose.

The *Mijes* were formerly a powerful nation: they still occupy the land from the Sierra, north of Tehuantepec, to the district of Chiapas. In the isthmus they inhabit the village of Guichicovi, and a small portion of the Sierra is never visited.

Physically and morally speaking, they are a degraded race, of repulsive aspect, and grossly ignorant. They, however, grow plantains, maize, beans, and sugar-cane, from the latter of which they extract an impure kind of sugar, which they supply to the southern division of the isthmus.

The ambition of the *Mijes* of Guichicovi is that of possessing the greatest possible number of mules, of which they make no use, not even for the carriage of goods, which they prefer carrying on their own backs.

The *Mijes* are idolaters, and pollute the altars of the Catholic churches with the blood of birds, which they offer as victims to other deities. Their number is about 5000.

The *Soques* came originally from Chiapas. They inhabit in the isthmus the

villages of San Miguel and Santa Maria Chimalapa. They are distinguished from the other inhabitants of these regions by their repulsive features.

In point of morality the Soques appear somewhat more rational than the Mijes, and they are naturally kind and obliging.

The Soques cultivate maize for their own consumption, a small quantity of tobacco, and two plants of the *bromelias*, from which they extract the *iztle* and the *pita*, the fibres of which they bleach, weave, and dye of different colours. Their spun threads, and the hammocks which they weave with them, constitute their chief industry.

The inhabitants of Santa Maria extract also some annatto, and supply the southern part of the isthmus with a delicious orange, which grows abundantly.

The *Zamboes*, a half-caste between the Indian and the Negro, chiefly inhabit the estates of the Marquisate del Valle. They are also mixed with the Zapotecos in the villages of Zanatepec, Nilttepec, Petapa, Barrio, and Santo Domingo.

The *Zamboes* are descended from African slaves, brought to the Marquesanas estates by the successors of Cortes, and to the Frailescas possessed by the Dominican friars in the territory of Zanatepec. They are robust and industrious, labourers in the fields, and applying themselves to the cultivation of wheat, indigo, and cochineal. Neither the *Zamboes* nor the other natives of these districts are remarkable for sobriety.

The climate of that portion of Tehuantepec, which in this part of the isthmus extends from the shores of the Pacific to the foot of the Sierra, is generally warm and dry, a circumstance to which is attributed its salubrity.

The climate of the elevated section of the isthmus is so different from that of the plains, that when the thermometer stands in the latter place at 30 deg., it scarcely rises to 13 deg. at Chivela or Tarifa. In all the heights surrounding these estates, we find the *pine ocote*, which indicates a temperate climate.

The summits of the Sierra Madre are generally enveloped in clouds, which coming from the Atlantic, there discharge their waters on the heights. This accounts for the rivers of the isthmus having an almost constant body of water during the greater part of the year. At Guichicovi and Santa Maria Chimalapa it rains almost incessantly.

MINERALS.—Iron is found in abundance in many parts of the isthmus, and that of Tarifa appears to be of excellent quality. As regards the precious metals, for which the department of Oajaca was formerly famous, there is a tradition still prevalent, that the mountains of Mijes and the upper Uspanapan contain rich gold and silver mines.

VEGETABLES.—The mangrove tree (*Rhizophora mangel*) is not so common on the coasts of the isthmus as on others of Mexico. In the southern division, it is found in the neighbourhood of San Francisco and of the Morro.

In the Peninsula of San Mateo and Santa Maria, the most remarkable trees

are the tamarind, palm, and cocoa-nut, besides which there is generally a luxuriant vegetation.

The land to the north of the lower eastern lagoon, in which the grounds of the Huaves of San Dionisio and San Francisco are situated, appear clothed with a vegetation, somewhat resembling that of the parks in Europe. The flowers in some of these localities are of splendid brilliancy.

Between the coast and the Sierra the plain is partly covered with acacias.

On approaching the Sierra the vegetation is more vigorous, and the Brazil-wood tree (*Cæsalpinia crista*) becomes very common. The granadillo, the mahogany tree (*Swietenia mahogany*), the copalchi (*Croton cascarilla*), and the dragon tree (*Pterocarpus draco*), make their appearance as well as many other shrubs that yield resins and balsams, to which the natives ascribe marvellous virtues. There are also the fustic (*Morus tinctoria*), and according to Don Tadeo Ortiz, the log-wood (*Hæmatoxylon campechianum*), as well as a considerable number of other trees, both picturesque and useful for the hardness and durability of their wood.

Both the soil and the climate are favourable to the cultivation of indigo and the sugar-cane, and those tracks of land which are protected from the winds produce cotton of excellent quality.

The table-land and hills between Tarifa and the Barrio appear covered with grass which affords excellent pasturage for cattle. The valleys abound with palm-trees, and there grows the ocote pine (*Pinus religiosa*?) which has some affinity with the *pinus picea*. The latter is also found on the summits of the hills between the above places and Santa Maria Chimalapa, alternately with the tropical plants which grow in the lower portions of the ground.

The luxuriance of the vegetation in the latter places exhibits a multitude of plants; however, the guayacan (*Diospyros lotus*), the cedar, the mahogany, the rosewood, the *gateado*, and the ebony, are there abundant. The amber-tree (*Liquidambar styraciflua*), from which is extracted the resin of the same name, and the tree yielding the Peru balsam (*Myroxylon peruiferum*), and the ocozotl, producing a gum very similar to the true amber, grow also in this district.

Two kinds of vine, bearing good grapes, the plantain, the orange-tree, two species spontaneous cocoa (*Theobroma cacao*), and the sapo-tatree of various kinds abound.

Several kinds of *indigoferas*: the *bixa orellana*, from which the annotto is extracted, the sarsaparilla (*Smilax salsaparilla*), the ginger (*Amomum zingiber*) two kinds of vanilla, are very common.

The table-land of Cerro Atravesado is covered with excellent pasture grass, and a splendid wood of pine ocotes.

Signor Moro says,—

“The southern side of the most elevated portion of the chain appeared to me profusely covered with majestic oak-trees.

"To the right of the upper Coatzacoalcos, or river Del Corte, are found in abundance various kinds of pines, and among them it would appear is the *Pinus abies*, which the Spanish government used to send to the dock-yard at the Havannah for the construction of ship-masts. According to Don Tadeo Ortiz, many of these trees are from two to four metres in diameter, and of a prodigious height; they are found at the very banks of the river. The plains watered by the rivers Malatengo, Chichihua, and Almoloya (the latter of which takes in its lower course the name of Guelaguesa) are noted in the isthmus for their delightful aspect. When speaking of the exploration of these rivers I have alluded to this fact, and therefore I will now only add, that the vegetation in them is similar, and perhaps even more luxuriant than that of the low grounds on the road to Santa Maria. The soil and climate are likewise peculiarly adapted to the growth of maize, coffee, cocoa, tobacco, rice, and the sugar-cane.

"On the road from Boca de Monte to the Mal Paso, the vegetation begins to assume an aspect peculiar to the plains of the Coatzacoalcos. The laurus sassafras, the fern tree, an infinite variety of palms, and the plants of the tropical regions already alluded to, united and interwoven with passion flowers, and innumerable filamentous reeds; or richly enveloped and crowned by a multitude of exquisitely beautiful orquidaciæ, formed an admirable and sublime spectacle. But the peculiar characteristic of these shrubberies is, that the plants concealed in the midst of this luxuriant vegetation appear desirous to reach as soon as possible, an elevation where they may enjoy the rays of the sun, thus acquiring an extraordinary height, and their stems being remarkably straight."

WILD ANIMALS.—Sigor Monro informs us, that in every estate of this isthmus a *tigrero* (tiger-man) is kept, who with a numerous pack of hounds is exclusively engaged in destroying wild beasts, which cause serious damage among the herds of cattle, notwithstanding the immense number of deer, hares, and rabbits on which they could and do also prey. As soon as the dogs discover one of these animals they set off in pursuit, and soon compel him to climb a tree for protection, where he is quickly despatched by the *tigrero*'s rifle.

The wild beast most common in the isthmus is that which is improperly called a tiger by the inhabitants, it being in reality the ounce (*Felis uncia*); after this comes the American lion or puma (*Felis discolor*); they are both numerous, but, it is said, never attack man. The ocellots, or small tiger (*Leopardus pardalis*), the wild cat, and the American fox (*Vulpes fulvus*), and martens are also numerous.

The most remarkable animal, in proportion to its size, is the tapir (*Tapirus terrestris*), which abound in great numbers in the upper course of the rivers Chicapa and Ostuta, as well as all the wild parts of the Sierra. The flesh has an agreeable taste.

In the Upper Ostuta there are considerable herds of wild cattle, the progeny of those which escaped into the woods from the old estates called Frailescas.

There are two kinds of hog common; one called the wild boar, bears no resemblance to the wild boar of Europe; the other the peccari, *Dicotyles tayacu* of zoology. The male has on the back a gland that contains a fœtid humour, but its flesh, especially that of the female, is delicious food.

In the woods, multitudes of monkeys, of the genera *Lagothrix* and *Ateles*.

Deer, rabbits, and hares are said to be innumerable.

Of the feathered tribe, the crax alector, improperly called pheasant, the wild turkey (*Meleagris gallo pavo*), the chachalaca (*Ortalia garrula*), parrots of beau-

tiful plumage, the partridge, the quail, the wild pigeon, and ducks of various kinds abound.

Among the reptiles are the guana, the flesh of which is considered by the natives delicate food. There are also the most dangerous kinds of serpents, such as the rattle-snake (*Crotalus horridus*), the coral coloured, and many others.

The lagoons, the rivers and the sea, contain a great variety and abundance of fish, and tortoises and turtles of various kinds. The divers of other coasts are in the habit of coming to the neighbourhood of the Morro in quest of tortoise-shell, coral, and pearl. The natives find also near the Morro a kind of purple shell-fish, from which they extract a substance much in use among them as a dye. The alligator inhabits the lakes near the coast.

The most remarkable products of insects are the honey and wax which the bees supply, and enormous bags of raw silk suspended by small worms from the branches of trees, which the women of Tehuantepec turn to useful account.

A road from the coast of the Pacific to the navigable portion of the Coatza-coalcos, opening a communication between the two seas, has been twice established. This took place first at the time of the conquest, and the second towards the end of the eighteenth century. At present scarcely any vestige remains of those roads, and the isthmus remains chiefly an unproductive waste.

AGRICULTURE.—“The estates,” says Senor Garay, “which more particularly deserve attention, both for their extent and for the improvement of which they are susceptible, are those called *Haciendas Marquesanas*, from being entailed in favour of Hernan Cortes, Marquis del Valle, whose descendants enjoyed them up to a late period.”

These estates are situated between the Barrio de la Soledad and the course of the rivers Malatengo and Chichihua, the stream of Zopiluapa, and the River del Cazadero. At present they belong to Messrs. Guergue and Maqueo, merchants of Oajaca, the former a Spaniard and the latter an Italian.

The produce most cultivated is maize for making *tortillas*; but the wanting roads to facilitate its carriage makes the inhabitants grow only as much as they require for their own consumption, which is insignificant, as the woods and rivers furnish them with an abundance of provisions.

Some attention is also paid to the cultivation of the sugar cane. There is a sugar factory in the neighbourhood of Chihuitan, belonging to Messrs. H. Gobert and Olivier Gourjon, the former a German and the latter a Frenchman.

According to Don Pedro de Garay, “this establishment, founded but a few years ago, can yield 50,000 kilogrammes of sugar, representing there a value of 45,000 francs, and 20,000 francs more for the brandy distilled from the molasses. Should the plantation and cultivation of the sugar-cane receive the encouragement of which they are susceptible, this estate alone might supply the sugar requisite for the consumption of the whole district of Tehuantepec, which may at present be considered to amount to about 125,000 kilogrammes.”

Senor Garay observes “that these are not the only plantations of sugar-cane existing

in the isthmus, and that the Indians of Guichicovi especially manufacture an impure sugar, used for the confection of brandy. This spirit is chiefly distilled at Tehuantepec, Juchitan, and Itzaltepec. Senor Garay estimates at 40,000 francs the total value of the brandy consumed in the southern part of the isthmus, to which he thinks ought to be added 30,000 francs for the *mescal*, a kind of brandy extracted in those places from the leaves of the American agave."

The most important agricultural produce in this part of the country is indigo. The secretary of the commission under Signor Moro remarks—

"It is of such excellent quality as to be in request in all parts of the republic, and it is also exported abroad. An average crop will produce about 60,000 kilogrammes, representing a value of 600,000 francs. Its cultivation demands scarcely any attention, as the plant continues to be productive for the long period of three years. It has been often calculated that the expense of the cultivation of indigo in fruitful years, before it acquires its perfect growth, does not exceed 3.75 francs per kilogramme, whilst its value is never less than ten francs.

"The settlements where this important cultivation is most flourishing are Juchitan, Itzaltepec, San Gerónimo, Chihuitan, and generally throughout the whole districts of Tehuantepec."

The cochineal insect of these parts is the best in quality of any known, but its cultivation is almost entirely abandoned. Gum is so abundant, that according to Senor Garay, the neighbourhood of Juchitan alone will furnish 300,000 kilogrammes.

CATTLE.—Formerly numerous herds of cattle grazed in the southern division of the isthmus. Don Tadeo Ortiz says, that in the Frailescas estates alone there were more than 30,000 head of horned cattle, besides a considerable quantity of horses. At present there are not more than 1500 of the former, and only a few hundreds of the latter.

According to the memoranda of the secretary of the commission, the number of horses and mules may be estimated at 25,000, and that of the sheep at 1500. No use whatever is made of the hides.

FISHERIES.—The shrimp and dry fish prepared by the Huaves in the four villages of the coast, besides providing for the consumption of the inhabitants of the country, are carried in rather large quantities to Oajaca.

SALT PITS.—The secretary of the commission says—

"That salt pits are so numerous, that it would be difficult to determine the quantity of salt they yield; but from a proximate calculation, made with the assistance of some well-informed persons, their produce may be estimated during the period when they were worked on account of the government at 35,000 kilogrammes; and it may be asserted with truth, that the whole of their produce was not turned to account, since it is no exaggeration to say that from Huamelula to Tonalá the entire intervening space is one continued salt mine. This salt is highly esteemed in various parts of the republic, both for its purity and its whiteness. The principal consumption takes place in the departments of Chiapas and Oajaca, the annual produce derived from it being about 200,000 francs. This salt was sold at the public administration of Tehuantepec at six francs per kilogramme, and somewhat less when sold in the works themselves. Its cost to the government was not more than one franc twenty-five cents for every 100 kilogrammes; since being of spontaneous formation, and not requiring any operation whatever, the expense was limited to the mere carriage from the works to the place of deposit."

MANUFACTURES.—As to manufactures, the inhabitants confine themselves

chiefly to leather-dressing and harness-making. At Tehuantepec and Juchitan doe-skins are prepared of any colour required, and with considerable skill. Other kinds of skin are also tanned there, and the sole-leather and dressed ox-hides of Tehuantepec are esteemed. Shoes and saddles manufactured of them are occasionally sent to Guatemala and the interior of the republic. They also make cotton stuff of considerable fineness, considering the imperfection of the looms employed for its manufacture.

SKETCH OF THE NORTHERN DIVISION OF THE ISTHMUS WITHIN THE DEPARTMENT OF VERA CRUZ.

This portion of the isthmus was formerly one of the most densely populated of the Mexican empire.

The topographical knowledge of this division, which is nearly covered with forests of almost impenetrable thickness, is very limited.

Don Tadeo Ortiz, comparing the Coatzacoalcos with the rivers Mississippi, Bravo, Panuco, Papaloapan (now Alvarado), Tabasco, Magdalena, and Orinoco, asserts that the waters of the Coatzacoalcos are always clear "even in the greatest floods," to which ought to be added the additional advantage of there being no logs of timber to obstruct its course, although it runs through a continuous forest, this circumstance being undoubtedly owing to the gentle current, and the tenacity of its banks.

The river next the Coatzacoalcos in importance is the Uspanapan, which Ortiz says "runs through a pleasant and picturesque region of temperate climate, and once thickly populated." This region, he thinks, is that which Cortes and Clavijero called Chimatlan and Quiexula.

"It is very probable," says Ortiz, "that this district which is now deserted, may afford a short and regular transit to the beautiful plains in the centre of the isthmus, as the conquerors penetrated through it into Upper Tabasco and Guatemala."

Besides the Uspanapan, the rivers Coahuapa, Coachapa, San Antonio, Tancochapa, and Zanapa, water also the plains lying on the right of the Coatzacoalcos: all of them are more or less navigable, and the latter discharges itself into the Atlantic, about forty kilometres, or about thirty miles, eastward of the mouth of the Coatzacoalcos.

The territory west of the Coatzacoalcos is also intersected by rivers, among which the Jaltepec and the San Juan are the largest. The former, before joining the Coatzacoalcos, flows through a country remarkable for its magnificent vegetation; and Ortiz is of opinion that a great portion of its course might be navigable for steamers. The latter falls into the Atlantic by Alvarado, and the Acayucans follow its course, when going to Vera Cruz, between which port and the Coatzacoalcos it is asserted that a canal communication might very easily be established.

In the district of Acayuca there are sixteen municipalities.

The town of Acayuca, situated at about 17 deg. 50 min. 30 sec. north latitude, and 5 min. 45 sec. east of the meridian of Juchitan, is the head of the district of the same name.

INHABITANTS.

The population of this district is estimated at about 21,000 inhabitants, divided into Europeans, Indians, and Mestizos.

The Europeans, who are few in number, and chiefly engaged in commerce, and the administration of public affairs.

The Indians constitute more than three-fourths of the whole population, and apply themselves to agriculture. These Indians are almost all Mexicans, and very ignorant and superstitious. Their manners and customs are somewhat loose; they are little inclined to work. They have not the disagreeable features of the Mijes and Soques, and are not to be compared to the Zapotecos; the excessive use of strong spirits, as well as the habit acquired from childhood of eating earth, deforms them, and imparts to them a sickly complexion.

Jaltipan is celebrated among the Indian villages of this territory, for having been the birth-place of Malinche (Dona Marina), who so greatly assisted Cortes Signor Moro says,

“The women of this village are famed, and not undeservedly, as the handsomest throughout the district; but in common with the rest of their sex in the isthmus they cannot boast of very strict ideas of propriety. It is also said that the male population, instead of watching them with a jealous eye, carry their ideas of hospitality to a very peculiar length.

“A singular circumstance, deserving the attention of the ethnologist, is the existence of a race of dumb people, of which there are numerous families in Jaltipan. However strange this may appear it is nevertheless certain, and the *Rancho de los mudos* (settlement of the dumb), established a few years since near the lower part of the island of Tacamichapa, owes its designation to the fact that the individuals are all dumb who inhabit the three or four houses which form the settlement.”

The *Mestizos* are in general more rational and industrious than the Indians; but, like them, indulge in intemperate habits, and are much more turbulent. The number of Mestizos exceeds that of the Europeans.

CLIMATE.—The climate of this part is damp, but its temperature being generally low, it is said by Moro to be by no means unhealthy, as its position would lead one to suppose. The centigrade thermometer does not reach in these regions more than 30 deg.; the most prevalent diseases are intermittent fevers, but no instances have hitherto been known of the yellow fever, endemic in other countries.

“About the year 1830, three expeditions of Europeans were sent to the Coatzacoalcos for the purpose of colonisation. By a most unaccountable want of foresight, the unfortunate colonists were abandoned from the moment of their arrival, and were left without provisions, without shelter against the inclemencies of the season, and without assistance of any kind. Although every thing seemed calculated to favour the development and progress of an epidemic, no disease of this kind appeared among them, for those who died perished more from misery and famine than from any other cause.

"By means of considerable felling of timber and the cultivation of the ground, the climate of this portion of the isthmus would no doubt be considerably improved, as it would remove the clouds of insects which at present render a residence here to a great degree uncomfortable."

MINERALS.—Moro relates that in a statistical account of Don José Maria Iglesias, mention is made of two mineral veins in the neighbourhood of the village of Joteapa, which were denounced in 1597 as being of silver, but the exact nature of which in reality is not known. It is stated in the same work that the calcareous rocks found in several parts of this territory might furnish excellent building materials; that in the settlement of *Los Quemados* there is beautiful alabaster; and near Jaltipan, gypsum of excellent quality. Lastly, it is stated that in the villages of Sayultepec and Moloacan there are fountains of petroleum; in the last-mentioned place and Almagres, springs of sulphureous water; and in the village of Chinameca, a fountain of mineral waters, without mentioning its qualities.

"I have been fortunate enough to be the first to find in the Mexican republic mines of coals of a superior quality, which I have already legally denounced, and the circumstance of their being situated in the neighbourhood of a great river, would render the conveyance of their produce very easy. I have seen no indication in the Isthmus of the existence of this valuable fossil."

VEGETABLE PRODUCTIONS.—All the plants of the southern division of the Isthmus, are also found in the northern. The luxuriance and majestic appearance of the forests of the Coatzacoalcos are beyond all description, and Don Tadeo Ortiz says, they exhibit "a truly monstrous vegetation, of which ocular inspection alone can give an adequate idea."

"These forests might furnish all the mahogany and other fine woods required in the United States and throughout Europe, at prices considerably less than those of other parts of America, where these woods are certainly neither so abundant nor of the gigantic size of three metres in width, and from fifteen to twenty in height."

Don José Maria Iglesias, speaking on the same subject, says,

"They abound (the forests) with the finest and most precious woods, but especially mahogany and cedar, which, without hyperbole, might well supply the whole of Europe."

Don Pedro de Garay says, in his memoir,

"There are seen on every side dye-woods and timber, which will in time acquire their true value, and will exceed, without doubt, the cost of any speculation."

On the high lands of almost all the rivers, and especially the Jaltepec and Uspanapan, the pine is found in the upper part of their course; below which the oak, and in the lower part, the most precious woods. Among those used in construction, the cedar, the sapota, the oak, the yellow-wood, the ebony, the *javicue*, *macayo*, and, above all, the *paqui* (iron-wood), which, from its extreme hardness, is also called *quiebra hacha* (break-axe).

Along the whole coast of the Atlantic, the tree yielding the pepper known by the name of myrtle (*myrtus pimenta*) is found growing luxuriantly.

In various parts the *siphonia caluca* flourishes, from which caoutchouc, or India-rubber, is obtained. In many parts the cassia is very common. Fruit trees, the sapotas of various kinds, the lemon, the orange, and the wild chocolate tree, as well as two kinds of vine are abundant. The vanilla, the indigo plant, and the sarsaparilla, are also very plentiful.

ANIMALS.—The number of wild animals which infest these territories is incredible, particularly in the neighbourhood of the settlement of Teposapa. According to Senor Iglesias, they are of the same kind as in the southern division. Some are peculiar to the woods of the Coatzacoalcos, among which are some nocturnal species and the *stentor ursinus*.

Along the course of the Coatzacoalcos, its banks are alive with the so-called pheasants, the wild turkeys, the pigeons, partridges, ducks, and many other fowl, the flesh of which is wholesome and delicious food.

The multitude of parrots which inhabit the woods is astonishing. Toucans, including the ramphastos and the pteroglossus, and other birds, are numerous, some of them being remarkable for the beauty of their plumage, and others for their song.

The waters abound in excellent fish. In the lower part of the Coatzacoalcos the manatus, or manate, is frequently found. A peculiar kind of fresh water tortoise deposits on the banks of these rivers great quantities of eggs quite different from those of the sea tortoise, and very similar to those of the hen both in appearance and taste.

The coasts of the Atlantic next to the Isthmus are celebrated for abundance of tortoise, the fishery of which for shells gives employment to the inhabitants of Campeachy.

The guanas, the flesh of which is a delicious morsel to the natives, differ in the southern and northern divisions. In the former they inhabit the dry and barren spots, and are of a dusky-brown colour, whilst those of the Coatzacoalcos are of a light green, variegated in the males with red spots. Venomous reptiles are also abundant.

In the oak thickets of this district there are in vast quantities bags of wild silk, and wax and honey in abundance.

There is no manufacturing industry of consequence. Agriculture has made some progress of late years, and several of the inhabitants have applied themselves to the cultivation of cotton and tobacco.

The cotton grown appears to be of excellent quality, and also the tobacco, which is especially cultivated in the territory of Jaltipan. The grains most generally sown are maize, beans, and rice, but only in sufficient quantity for home consumption.

The soil is so fruitful that both Don Tadeo Ortiz and Don José Maria

Iglesias assert, that the efforts of the cultivator are in some places rewarded with five annual crops of maize.

Senor Ortiz, speaking with enthusiasm of this fertility, says—

“That which most particularly characterises this privileged region, however, is the singular fact that one single sowing of rice will yield successively two large crops without the slightest additional labour, as I had an opportunity of observing in the rancho de Gavilanes, situated in the strand between the rivers Coatzacoalcos and Toneladas.”

The sugar-cane, coffee, and cocoa, prosper, and are cultivated in the neighbourhood of all the settlements, although in very limited quantities. On the Coatzacoalcos, the only plantation of any importance is one of coffee and cocoa, which an European settler established a few years ago, near Hidalgotitlan on the banks of this river, opposite to this village.

The *iztle* is chiefly cultivated at Jaltipan, Soconusco, Tejistepec, Oteapa, Ishuatlan, and Moloacan. In 1831, Senor Iglesias numbered 1221 *iztle* plantations, the value of the produce of which, generally sent to Vera Cruz, he estimated at upwards of 100,000 francs.

In Mina-titlan there was then a brandy distillery, the most considerable in the district, but almost everywhere, and even in the ranchos or small settlements, this pernicious liquor is distilled by means of a still of baked earth.

As regards mechanical arts, it may be said that none exist in this district.

There is little doubt, from all that can be judged of the foregoing data, that a canal across this isthmus might be constructed, though with considerable difficulty in overcoming the natural obstacles which are to be removed. Opening so rich a country would assuredly pay those who had capital and skill to accomplish the undertaking. But the moral and political obstacles never will be overcome while the Spanish race possesses the country. Is there any other race whom the Deity has allowed to exist, except, probably, the Turks and Africans, who would have so thoroughly neglected a territory surpassed by no other on the surface of the globe?

PROJECTED CANAL ACROSS THE ISTHMUS OF PANAMA.

From Chagres to the Bay of Panama, the insalubrity of the climate is urged as a fatal objection to the construction of a navigable canal. There are only two seasons—the dry season, or summer; and the rainy season, or winter. The first begins with the last part of December, and lasts till April; the second follows in April, and continues until December. In those parts which are most advantageously situated, as in the city of Panama and its neighbourhood, rain begins to fall in April, and May and June are rainy months. In July, August, September, and October, it rains incessantly. In November rain seldom falls, except during night; the weather usually clears up in December. Rain scarcely ever occurs during the months of January, February, and March. Lightning and thunder-storms are frequent during the rainy season. In the early part of the summer the thermometer rises to 90 deg., and even to 93 deg., and the weather is very sultry during the day. The land-winds at night are

cool, and blow from the mountains which occupy the middle of the isthmus. In the rainy season the thermometer stands at night at 82 deg., and in the day it rises to 87 deg. The city of Panama is considered an exception to the unhealthiness of the isthmus.

Luxuriant fertility is the characteristic of this part of Central America. The caoutchouc-tree, the *palo de vaca* (the milk-tree), vanilla, the *styrax officinalis* of Linnæus, and many valuable woods and plants are abundant. Rice and Indian corn are grown; the sugar-cane, coffee, and cacao, are cultivated for domestic consumption.

Of the live stock, the horned called are esteemed; the horses are small and hardy. Mules, goats, pigs, and poultry are reared. Wild deer, monkeys, the guana, rabbits, and hogs are eaten. The tiger-cat, puma, and bear are found. Wild turkeys, pheasants, pigeons, and ducks are met with. Fish is plentiful; hundreds of young sharks, the young shovel-nosed, are daily sold at Panama for food. Materials for building are abundant. Charcoal is exported.

Panama has some excellent deep harbours, and several good ones for small vessels.

PORTO BELLO (*Puerto Velo*), in 9 deg. 34 min. north latitude, and 77 deg. 54 min. west longitude, is a good port, surrounded by high mountains. The town stretches into the bay, forming scarcely more than one street. Formerly it was a populous trading place. From the unhealthiness of the climate, it has been nearly abandoned by the few inhabitants, who have survived its vomito and fevers.

LIMONES' BAY, or Puerto de Naos (Navy Bay), west of Porto Bello, affords good anchorage. The Rio Chagres approaches within two and a half miles of bay, and as the intervening tract is quite level a canal has been suggested, as easily practicable.

CHAGRES, at the mouth of the Rio Chagres, has a harbour for vessels drawing no more than ten to twelve feet water. A bar or ledge of rocks extends across its entrance. It is said to be very unhealthy. From this harbour, which has a village of miserable houses, some trade is carried on across the shores to and from Panama. The distance is travelled over in about eighteen hours.

PANAMA, in 8 deg. 58 min. N. lat., and 79 deg. 30 min. W. lat., is built on a neck and point of land which extends into the bay. It is well built of stone, the houses have patios or courts. It has a cathedral, several convents, a college, and some other public buildings. The harbour is protected by a number of islands, and there is good anchorage within them. The trade consists in the exportation of the produce of the country to Lima and Guayaquil; and by way of Jamaica gold and silver is frequently sent from Panama to Europe. The population,

which consists almost entirely of a mixed race, is estimated at nearly 200,000. There is no town of any importance in the interior: east of Porto Bello and Panama, the country is very thinly inhabited. Cruces, on the Chagres, with about 2000 inhabitants, who live in miserable huts, is the entrepôt where goods are put on board of boats to be brought down to Chagres: from Panama to Cruces they are conveyed on mules. Farther west is Chorera, on the river of that name, which it is said contains about 4000 inhabitants, and carries on some trade; and Nata Los Santos, each inhabited by about 4000 persons, and situated on the best-cultivated part of the Isthmus of Panama. Steam packets are now established between Panama, and several ports south, to those of Chili.

On the Pacific the harbour of Punta de Arenas is situated on the eastern shores of the Gulf of Nicoya, and has good anchorage for vessels drawing no more than nine or ten feet of water: it is the harbour of San José, the present capital of Costa Rica, which is about seventy-three miles distant, and exports, through Punta de Arenas, sugar, timber, and some maize to Peru and Chile.

M. Michel Chevalier, while examining the circumstances which ought to be kept in view in selecting the most appropriate place for an oceanic communication, observes, that one of the most important is its salubrity. He says:

"However great might be the saving of time effected by steering through the Isthmus, it would always be shunned by vessels if it were to prove a charnel-house."

Signor Moro says:

"The climate of the Isthmus of Panama is acknowledged to be dangerous, a fact confirmed by the accounts of Humboldt and other writers. The fear of its unhealthiness was one of the causes that prevented the assembling of Congress there, after the emancipation of the states of Spanish America had been convened, in order to establish a system of general policy suited to the interests of the American nations. The same fear prevented the engineers, Lloyd and Falmarc, remaining in the Isthmus a sufficient time to complete the labours of the exploration, which they undertook in 1827 and 1828, by order of General Bolivar, and in a succeeding expedition Lloyd lost his life. To this grievous cause is likewise to be ascribed the paucity of population and the want of the necessary means of existence in that Isthmus, and as the climate does not permit the increase of the former, there is no possibility of augmenting the latter.

"The Isthmus of Panama is again being explored, but it has been lately estimated that even should the work be at all practicable, its accomplishment would require the united efforts of the principal nations of the world, and an expenditure of at least 200,000,000 francs."

According to the surveys of M. Garella, by order of the French government, a canal through the Isthmus of Panama presents great difficulties. The length of the proposed canal through Panama would be only about thirty miles, and the utmost height to be attained, according to M. Garella, only 177 feet; but it is asserted that there is no means of boring water to the summit level. This is certainly, if true, a great obstacle. M. Garella proposes to make a tunnel, the cost of which would be 2,000,000*l.* sterling. Other authorities, especially Mr. Wheelwright, assert that the country from Chagres to the Pacific is nearly level;

and we are not disposed to condemn the project of a canal over this Isthmus until we have far more complete surveys than we yet possess.

It is certain that since Mr. Wheelwright and the British company have established steamboats between Panama and various ports of the Pacific, that the greatest advantages to trade and commerce have been the result. In connexion with the establishment of these steamboats, we have been furnished with calculations and statements, which we have condensed as follows :

From the discovery of the Pacific down to the independence of the Spanish American provinces in 1824, Panama was the highway between Spain and her possessions, along the west coast of America. Vasco Nunes de Balbao, in 1513, crossed the Isthmus with troops, from Santa Maria del Darien to the Gulf of San Miguel. In 1524, the city of Panama had a governor. It became the seat of a royal " Audiencia," and until the discontinuance of the Spanish galleons, it was the depôt of the merchandise sent from Spain for the southern coast of New Granada and Peru and the northern ports of Central America. During the war of independence in Peru, troops from Spain were sent up the Chagres to Panama, and from thence by transports to Peru. The buccaneers, as early as the reign of Queen Elizabeth, frequently passed over this route ; and until the trade with the Pacific, by Cape Horn, was opened by British ships, the Spanish colonists on the Pacific coasts were clandestinely supplied through Jamaica, by way of Panama.

The canoes on the Chagres are described as large enough to carry eighty bales of merchandise.

With respect to the length of voyage and distance round Cape Horn, and by way of transit through the isthmus, we have some curious statements. It is said that a fast-sailing schooner, of the class known under the designation of "*Clipper*," took thirty-two days in sailing from Panama to San Blas, a voyage which, by a steamer proceeding direct, might be performed in eight or nine days. The extreme difficulty of sailing to the westward from Panama Bay, arises from

calms, squalls from all directions, and the struggle of opposing winds and currents. The same "clipper," sailing often at eleven and eleven-and-a-half knots per hour, took twelve days on her voyage from Valparaiso, in sailing from the equator to Panama.

If a canal be impracticable across the short distance over the Isthmus of Panama, a railroad would undoubtedly be a work of neither great difficulty nor expense, even according to Mr. Garella's report. We fear, however, that the great obstacle will be found in the moral and political difficulties.

One writer says—

"If ever it should be ceded to another power, the nation holding it will acquire an immense influence and power over the communication of the world (supposing the above improvements in steam), with a territory well-wooded, well-watered, fertile in the extreme, rich in gold and pearl fisheries, capable of supporting a numerous population, and not, by any means, *generally* unhealthy; while the inhabitants will acquire that wealth and prosperity which the advantages of their situation secure to them."

The transit from Panama to Chagres is easy, being only twenty-one miles by land, and the remainder by a river, safe and navigable for boats and canoes. This was the route by which the several towns and provinces on the Pacific Ocean made their communications with Europe, before the separation of the Colonies from Spain; but the frequent revolutions which have taken place in South America, and the consequent poverty and want of enterprise in the Spanish population, have disturbed periodical communications between these places.

CANAL ROUTE BY THE ISTHMUS OF NICARAGUA.

Surveys and projects have been made, in order to construct a navigable canal from the harbour of San Juan, already described, to the lakes of Nicaragua and Managua, and thence by a short cut to the Pacific. If England, France, and the United States, were to enter into a contract with any *de facto* government of the country, whatever government succeeded would be then compelled to observe the stipulations of such treaty. Until then we can hold out no security whatever for executing a work which would be immediately undertaken by the capitalists of Europe and America. If there were no moral, social, or political obstacles, there is no doubt that the natural obstructions might, with comparatively little difficulty, be overcome. Mr. Baily, an English engineer, surveyed the route in 1837-8; a survey of the river was made by Mr. Lawrence, of her Majesty's ship *Thunderer*, in 1840, and a report was also made by a Captain A. G., quoted in an able work on the subject, privately printed, by Prince Napoleon Louis Bonaparte, whom the government of Nicaragua, in December, 1845, offered to place at the head of the executive direction of an undertaking to construct the projected canal.

Mr. Stephens did not visit the River San Juan, but he did visit both the lakes of Nicaragua and Leon, or Managua, and the port of Realejo. He describes the Lake of Leon, or Managua, as not so vast or broad as the Lake of Nicaragua, but that it is a noble sheet of water, and in full view of the volcano of Momotombo. The shore presented the animated spectacle of women filling their water-jars, men bathing, horses and mules drinking, and in one place was a range of fishermen's huts; on the edge of the water stakes were set up in a triangular form, and women, with small hand-nets, were catching fish, which they threw into hollow places, dug, or rather scraped, in the hand. The fish were called sardinitos, and at the door of the huts the men were building fires to cook them. "The beauty of this scene was enhanced by the reflection that it underwent no change. Here was perpetual summer; no winter ever came to drive the inhabitants shivering to their fires; but still it may be questioned whether, with the same scenery and climate, wants few and easily supplied, luxuriating in the open air, and by the side of this lovely lake, even the descendants of the Anglo-Saxon race would not lose their energy and industry."

This lake empties itself into the Lake of Nicaragua by means of the River Tipitapa, a communication between the two seas has been suggested, by means of a canal from it to the Pacific, at the port of Realejo.* The ground is perfectly

* The harbour of Realejo, on the Pacific, was surveyed by Captain Sir Edward Belcher in 1838. Of this harbour he says—

"Cardon, at the mouth of the port of Realejo, is situated in 12 deg. 28 min. north, and about 87 deg. 12 min. west. It has two entrances, both of which are safe, under proper precaution, in all weather. The depth varies from two to seven fathoms, and good and safe anchorage extends for several miles; the rise and fall of tide is eleven feet, full and change three hours six minutes. Docks or slips, therefore, may easily be constructed, and timber is readily to be procured of any dimensions; wood, water, and immediate necessities and luxuries, are plentiful and cheap. The

level, and the port is perhaps the best in Spanish America; but the distance is sixty miles, and there are other difficulties which seemed to him insuperable.

There is not a single stream on the contemplated line of canal from this lake to the Pacific, and it would be necessary for this lake to furnish the whole supply of water for communication with both oceans.

Of the harbour of Realejo, Mr. Stephens observes—

“Rested and refreshed I walked down to the shore. Our encampment was about the centre of the harbour, which was the finest I saw in the Pacific. It is not large, but beautifully protected, being almost in the form of the letter U. The arms are high and parallel, running nearly north and south, and terminating in high perpendicular bluffs. As I afterwards learned from Mr. Baily, the water is deep, and under either bluff, according to the wind, vessels of the largest class can ride with perfect safety. Supposing this to be correct, there is but one objection to this harbour, which I derive from Captain D'Yriaste, with whom I made the voyage from Zonzonate to Caldera. He has been nine years navigating the coast of the Pacific, from Peru to the Gulf of California, and has made valuable notes, which he intends publishing in France, and he told me that during the summer months, from November to May, the strong north winds which sweep over the Lake of Nicaragua, pass with such violence through the Gulf of Papajayo, that during the prevalence of these winds it is almost impossible for a vessel to enter the port of San Juan. Whether this is true to the extent that Captain Yriaste supposes, and if true, how far steam-tugs would answer to bring vessels in against such a wind, is for others to determine. But at the moment there seemed more palpable difficulties.

“The harbour was perfectly desolate, for years not a vessel had entered it; primeval trees grew around it, for miles there was not a habitation; I walked the shore alone. Since Mr. Baily left, not a person had visited it; and probably the only thing that keeps it alive, even in memory, is the theorising of scientific men, or the occasional visit of some Nicaragua fisherman, who, too lazy to work, seeks his food in the sea. It seemed preposterous to consider it the focus of a great commercial enterprise; to imagine that a city was to rise up out of the forest, the desolate harbour to be filled with ships, and become a great portal for the thoroughfare of natives. But the scene was magnificent. The sun was setting, and the high western headland threw a deep shade over the water. It was, perhaps, the last time in my life that I should see the Pacific, and in spite of fever and ague tendencies, I bathed once more in the great ocean.

“At seven o'clock we started, recrossed the stream, at which we had procured water, and returned to the first station of Mr. Baily. It was on the river San Juan, a mile and a half from the sea. The river here had sufficient depth of water for large vessels, and from this point Mr. Baily commenced his survey to the Lake of Nicaragua.

“My guide cleared a path for me with his machete; and working our way across the plain, we entered a valley, which ran in a great ravine called Quebrada Grande, between the mountain ranges of Zebadea and El Platina.

“Up to this place manifestly there could be no difficulty in cutting a canal, beyond the line of survey follows the small stream of El Cacao for another league, when it crossed the mountain, but there was such a rank growth of young trees, that it was impossible to continue without sending men forward to clear the way. We therefore left the line of the canal, and crossing the valley to the right, reached the foot of the mountain over which the road to Nicaragua passes.

“The side of the mountain was very steep, and besides large trees, was full of brambles, thorn bushes, and licks. I was obliged to dismount and lead my macko; the dark skin of my guide glistened with perspiration, and it was almost a climb till we reached the top.

“Coming out into the road the change was beautiful. It was about ten feet wide, straight, and shaded by the noblest trees in the Nicaragua forests. In an hour we reached the bocca of the mountain, where Nicolas was waiting with the mules under the

village of Realejo is about nine miles from the sea, and its population is about 1000 souls. The principal occupation of the working males is on the water, loading and unloading vessels. It has a custom-house and officers under a collector, comptroller, and captain of the port.”—*Voyage round the World*, vol. ii., p. 307.

shade of a large tree, which threw its branches fifty feet from its trunk, and seemed reared by a beneficent hand for the shelter of a weary traveller. Soon we reached another station of Mr. Baily. Looking back I saw the two great mountain ranges, standing like giant portals, and could but think what a magnificent spectacle it would be to see a ship with all its spars and rigging, cross the plain, pass through the great door, and move on to the Pacific. Beyond, the whole plain was on fire; the long grass, scorched by the summer's sun, crackled, flashed, and burned like powder. The road was a sheet of flame, and when the fire had passed the earth was black and hot.

"Off from the road, on the edge of the woods, and near the River Las Lakas, was another station of Mr. Baily. From that place the line runs direct over a plain till it strikes the same river near the Lake of Nicaragua. I attempted to follow the lines again, but was prevented by the growth of underwood.

"Beautiful as the whole country had been, I found nothing equal to the two hours before entering Nicaragua. The fields were covered with high grass, studded with noble trees, and bordered at a distance by a dark forest, while in front, high and towering, of a conical form, rose the beautiful volcano of the island. Herds of cattle gave it a home-like appearance.

"The whole of the next morning I devoted to making inquiries on the subject of the canal route. More is known of it in the United States than at Nicaragua. I did not find one man who had been to the port of San Juan, or even who knew Mr. Baily's terminating point on the Lake of Nicaragua. I was obliged to send for my old guide, and after a noonday dinner started for the lake. The town consisted of a large collection of straggling houses, without a single object of interest. Though the richest state in the confederacy in natural gifts, the population is the most miserable.

"Before reaching the lake we heard the waves breaking upon the shore like the waves of the sea, and when we emerged from the woods the view before us was grand. On one side no land was visible; a strong north-wind was sweeping over the lake, and its surface was violently agitated; the waves rolled and broke upon the shore with solemn majesty; and opposite, in the centre of the lake, were the islands of Isola and Madeira, with giant volcanoes rising as if to scale the heavens. The great volcano of Omotopeque reminded me of Mount Etna, rising like the pride of Sicily from the water's edge, a smooth, unbroken cone, to the height of nearly 6000 feet.

"Mr. Baily is a half-pay officer in the British navy. Two years before he was employed by the government of Central America to make a survey of this canal route, and he had completed all except the survey of an unimportant part of the River San Juan, when the revolution broke out. The states declared their independence of the general government, and disclaimed all liability for its debts. Mr. Baily had given his time and labour, and when I saw him had sent his son to make a last appeal to the shadow of the federal government; but before he reached the capital this government was utterly annihilated, and Mr. Baily remains with no reward for his arduous services but the satisfaction of having been a pioneer in a noble work. On my arrival at Grenada he laid before me all his maps and drawings, with liberty to make what use of them I pleased."

The River San Juan, according to Mr. Baily, is, with its windings, ninety English miles long. Mr. G. Lawrance, mate and assistant-surveyor of her majesty's surveying vessel *Thunderer* makes it 104 miles. The Lake of Nicaragua is ninety geographical miles long; the river of Tipitapa, joining the Lake of Nicaragua to that of Leon, is twenty miles; the Lake of Leon, or Managua, is thirty-five miles; and the isthmus between the Lake of Leon, and the port of Realejo, is twenty-nine miles across; total length of projected canal 278 miles, or, according to Mr. Baily, 264 miles: eighty-two miles of which require deepening, or locks, and other canal work.

Mr. Baily calculates the Lake of Nicaragua to be 128 feet three inches above the level of the Pacific Ocean, at low water and full moon.

The Lake of Managua is twenty-eight feet eight inches above the level of that of Nicaragua.

The most elevated summit to be traversed, between the Lake Managua and Realejo, is fifty-five feet six inches above the level of the lake. Total height of the summit level, 212 feet five inches.

M. Garella makes the difference of level between high water in the Pacific and low water in the Atlantic nineteen feet and a half, which will make the summit level above the Pacific 231 feet eleven inches.

"THE RIVER SAN JUAN," says Mr. Baily, "flows from the Lake of Nicaragua at its south-eastern extremity, at the place where formerly stood the fort of St. Charles, now completely destroyed. Here is the only discharge for the waters of both the lakes. The whole length of the river, pursuing all its windings from St. Charles down to the port of San Juan del Norte, is ninety miles (others say 104 miles); it forms a magnificent stream, somewhat irregular in its breadth, which varies from 100 to 200 yards, studded with small islands, forming for the most part a channel on each side of them. The depth of the water varies from one-and-a-half to seven, eight, and nine fathoms. In the mid-stream the depth is generally from three to five fathoms, but during the rainy season, namely, from May to November, the depth is considerably increased; for, according to observations made at the ruined fort near Grenada, in calm weather, in October, 1838, when the rainy season had just terminated, and again in May, 1839, before the rains had commenced, when the lake was at the lowest, the difference of height between these extremes was found to be six feet six inches. In November, 1839, at which time the rains had ceased, the same observations were made, and the result was that the waters had risen fourteen inches less than in the previous year.

"The banks of the river, particularly the right, are fringed with wood of all sizes and descriptions, with a dense undergrowth, forming, altogether, a forest nearly impenetrable; consequently there are no inhabitants, nor is the land cultivated, although of prodigious fertility. The immediate shores are undulating, being in some parts not more than a few feet, and in others between twenty and thirty feet above the surface of the water.

"Two large rivers, the San Carlos and Sarapiquí, besides many small streams, discharge into the San Juan."

Captain A. G——, quoted by Prince Napoleon Louis, says, there are large rivers, which have their source in the mountains bordering the country of the Mosquitos, which discharge from the left bank into the San Juan.

"From the gentle declivity of the River San Juan, the current is not strong, being at the rate of a mile or a mile-and-a-half per hour, except in the times of freshes, when it is accelerated variously, according to circumstances. It is navigated all the year round by boats of eight or ten tons' burden, called *bongos*, and which are generally manned by ten or twelve men, besides the patron. They can carry about 100 *seroons* of indigo, or 500 hides, or a proportionate quantity of Brazilian timber. The obstacles which now prevent the advantageous navigation of the River San Juan are,—first, the rapids; secondly, the drainage occasioned by its influx into another river, called the Colorado, seventeen miles above the port of San Juan; and lastly, the labyrinths of small islands, which extend ten or twelve miles from the opening of the River Colorado to the mouth of the River San Juan. It is generally believed that at some former epoch, the Spaniards purposely enlarged the opening of this branch with the intent of exhausting the main river, at that part, to such an extent as to render the river impracticable to navigation, hoping thereby to protect the town of Grenada from external attacks. In the present advanced stage of the science of civil engineering, this obstacle would be easily surmounted. The rapids are four in number; called *del Toro del Castillo Viejo*, *de las Balas*, and *de Machuca*, all compromised within an extent of ten miles, but there is clear water-way from one to the other, having good depth of from

three to six fathoms; the longest of these rapids is not more than one mile. The rocks by which they are occasioned are all placed transversely to the current, leaving a narrow channel on each side, and showing their ragged and sharpened edges above the surface of the water during the dry season.

"The breadth of the river from this point is between 100 and 120 yards; the current rushes with violence, and dashes with great force against and between the projecting points. The *bongos*, however, make the passage without hazard, and we have never heard of the occurrence of an accident.

"The Colorado diverges from the San Juan in 10 deg. 50 min. north latitude, and after running in a south-westerly direction, falls into the sea in 10 deg. 46 min., forming a dangerous bar. This river abstracts from the main stream a considerable quantity of water, the opening from the San Juan being 1200 feet wide, and having in the deepest part nine feet of water at the lowest state of the river. From measurements of this section, carefully taken at two different periods, in May when at the minimum, and in July when much increased by freshes, it appears from calculation, that at the first period the loss of water from the river was 28,178 cubic yards per minute, and at the latter observation, as much as 85,840 cubic yards. The main current being thus suddenly weakened, the motion of the water becomes sluggish, and the natural effect is, that deposits of sand and mud are formed, which gradually augment where the movement of the water is feeble; trunks of trees and other floating bodies grounding on these, small islets are formed by successive aggregations, which soon become covered with rank grass, reeds, and other herbaceous plants of rapid growth; a great number of these mounds have been thus raised, and the progress of formation is continually going on. The usual methods of clearing the beds of rivers could here be applied with facility and good effect, as the accumulations are nothing more than silt and sand with occasional logs buried underneath. A dam across the Colorado branch, constructed on such of the well-known plans as might be judged the most efficient, would be indispensable. Then the reforced body of water, aided, if necessary, by the resources of art, would, by the momentum of its increased velocity, soon clear a channel to the depth that should be deemed requisite: other parts of the river where such operations might be wanted, could be improved by nearly similar methods, as the bottom is everywhere composed of mud and sand, except about the rapids, where it is of rock or loose stones.

THE LAKE OF NICARAGUA OR GRENADA.—Mr. Bailly says,

"The Lake of Grenada is ninety geographical miles long, its greatest breadth is forty, and the mean twenty miles; the depth of water is variable, being in some places close to the shore, and in others half a mile from it, two fathoms, increasing gradually to eight, ten, twelve, and fifteen fathoms, the bottom usually mud. [Mr. A. G.—sounded in the middle of the lake forty-five fathoms.] This basin is the receptacle of the waters from a tract of country six to ten leagues in breadth on each side of it, thrown in by numerous streams and rivers, none of them navigable except the river Frio, having its source far away in the mountains of Costa Rica, which discharges into the lake a large quantity of water near the spot where the river San Juan flows out of it. The embouchure is 200 yards wide, and nearly two fathoms deep. There are several islands and groups of islets in different parts of the lake, but none of them embarrass the navigation, nor is this anywhere incommoded by shoals or banks, other than the shallow water in shore; and even this is but very trifling, or rather it is no impediment at all to the craft at present in use, the practice being to keep the shore close aboard for the purpose of choosing convenient stopping-places at the close of day, as they scarcely ever continue their voyage during the night.

"The district extending to the eastern coast is called Chontales. Its soil, although covered with trees, presents in different places excellent pasturage, divided into farms, on which the breeding of cattle is chiefly pursued.

"The largest islands on the lake are Omotepe, Madera, and Zapatera. Taken together, the first two of these islands are twelve miles long. Zapatera is almost triangular, and five miles long. Sanate, Salentinane, and Zapote, are smaller, and uninhabited, but some of them, and the last in particular, are capable of cultivation.

"Near the town of Grenada there is the best anchorage for ships of the largest dimensions."

THE RIVER TIPITAPA.—Mr. Baily says,

"The Lake of Nicaragua is connected with that of Leon by means of the river Panaloya (or Tipitapa), navigable for the boats employed in that country for twelve miles, as far as the place called Pasquiel, where the inhabitants go to cut and bring away Brazilian timber. The four miles which remain between that place and the Lake of Leon, are not navigable by any kind of boat, whatever may be its construction, because, beyond Pasquiel, the channel is obstructed by a vein of rocks, which, when the river is swollen, are covered with water; but in the dry season, the water sinks so low that it can only escape through gradually diminishing fissures in the rocks. At a distance of a mile beyond this first vein of rocks, we find another more solid, which, crossing the river at right angles, forms a cascade of thirteen feet descent.

"The river Tipitapa, which discharges itself into the Lake of Nicaragua, is the only outlet for the Lake Leon. The lands bordering this river are somewhat low, but fertile, having excellent pasturage; as at Chontales, they are divided into grazing and breeding farms. All this country, covered with Brazilian timber, is scantily inhabited. The only village is that of Tipitapa, situated near the above-mentioned waterfall. It contains a small church, and about 100 cottages. The river is crossed by a wooden bridge."

Captain A. G—— is of opinion, that for the first twelve miles, it would only be necessary to have a lock to increase the depth of the river. Mr. Lawrance says, that the navigable part of the river has a depth of from three to eighteen feet, and that the fall at Pasquiel is thirteen feet high. He estimates the length of the river at twenty miles. According to Mr. Stephens, the whole fall of the river Tipitapa, which amounts to twenty-eight feet, is comprised within the first six miles from the Lake Leon. Mr. Rouhaud, who has assisted in the topographical discoveries in that country, told M. Michel Chevalier that the fall of twenty-eight feet was distributed as follows, viz., eighteen feet are precipitated by a cascade at Tipitapa, and the remaining ten feet and a half descend from Tipitapa to Nicaragua.

THE LAKE OF LEON OR MANAGUA.—The Lake of Leon is from thirty-two to thirty-five miles long, and sixteen miles at its greatest width. It receives from the circumjacent lands, chiefly from the eastern coast, a number of small streams. According to Mr. Lawrance, it is not so deep as that of Nicaragua; but, according to Captain A. G——, it is still deeper.

THE ISTHMUS BETWEEN THE LAKE LEON AND REALEJO.—M. Michel Chevalier says, that the account of the celebrated navigator Dampier, who had been at war in those regions, induced a belief that throughout the different routes from the Lake Leon to Realejo, and from the Lake of Nicaragua to the Gulf of Papagayo or to that of Nicaya, the land consists for the most part of level plains, and that between the lake of Leon and the coast of Realejo, the soil is quite flat. Mr. Rouhaud has described in the same terms the country between the north-western part of the Lake of Leon, and the port of Realejo, and of the tract of land which extends between the same point and the port of Tamarindo. He thinks nineteen feet or twenty-two feet to be the height of the bank above the level of

the water. "Then comes," says he, "a small zone on a very slight and yet sensible declivity, by which we gently descend to the Pacific Ocean."

M. Michel Chevalier says (page 96),

"I see, however, in the description of Central America and Mexico, published in Boston in 1833, that the highest land between the Lake of Leon and the Pacific Ocean descends to be only fifty-one feet above the level of the lake. From the same lake to the River Tosta is but eleven miles; and that river not more than three feet above the level of the lake, at the point where a junction might be effected. If fully established, this statement would be of great importance, for we can avoid any extraordinary cutting, and *à fortiori* a tunnel. A cutting of seventy-two feet maximum is nothing unusual in the operations of the engineers of the *ponts* and *chaussées*. By employing improved machinery and implements, which are now at the disposal of the engineer, we can execute deep cuttings at little expense, in the absence of rocky grounds. In the canal from Arles to Bouc, for instance, the table-land of the Lègue has been cut through to the extent of 2289 yards, the extreme depth being from forty-three to fifty-four yards. The expense has been less than 160,000*l.*, notwithstanding its having been executed on the old system. Now-a-days, works of this nature are executed with powerful engines; manual labour is confined to mere digging and loading; and upon the great northern railroad of France, a machine has been successfully and economically employed even for this last purpose."

Sir Edward Belcher, R. N., who explored part of the country in 1838, says—

"At the term—day, we pitched our observatory near the sea-margin, at the base of the volcano of Consequina, or Quisiguina, and having completed the requisite observations, started with the *Starling* and boats to explore the Estero Real, which I had been given to understand was navigable for *sixty miles*; in which case, from what I had seen of its course on my visit to the Viejo, it must nearly communicate with the Lake of Managua.

"After considerable labour, we succeeded in carrying the *Starling* thirty miles from its mouth, and could easily have gone further, had the wind permitted, but the prevailing strong winds rendered the toil of towing too heavy.

"We ascended a small hill about a mile below our extreme position, from which angles were taken to all the commanding peaks. From that survey, added to what I remarked from the summit of the Viejo, I am satisfied that the stream could have been followed many miles higher; and I have not the slightest doubt that it is fed very near to the Lake of Managua. I saw the mountains beyond the lake on its eastern side, and no land higher than the intervening trees occurred. This, therefore, would be the most advantageous line for a canal, which, by *entire lake navigation*, might be connected with the interior of the states of San Salvador, Honduras, Nicaragua, and extended to the Atlantic. Thirty navigable miles for vessels drawing ten feet, we can vouch for, and the natives and residents assert sixty more. But steamers will be absolutely necessary to tow against the prevalent breezes."—*Voyage Round the World*, Vol. I., pp. 236.

He adds in the Appendix, that—

"In the port of Realejo there is a river, the Donna Paula, which takes a course towards Leon, and is navigable within three leagues of that city. It has been suggested to carry a railroad from Leon to the Lake of Managua. As to any canal into the Pacific, unless behind Monotombo, Telica, and Viejo range, into the Estero Real, I see little feasibility in the scheme."

Mr. Bailly tells us,

"In executing so stupendous an undertaking, salubrity of climate, and the means of feeding abundantly and economically so large a body of workmen as would be collected, are subjects that cannot be passed over without notice. With regard to the first, the writer can aver that during four months that he was occupied between the Pacific and the Lake of Grenada, with a party of forty individuals, there was not a man pre-

vented by sickness from performing his daily labour, although continually sleeping at night in the open air. On the lake and in the river San Juan, with a large party, the men maintained their health well, although exposed to frequent rains in the latter. But when at the port (del Norte), or near to it, sickness got among them, which was mainly attributable to the use or rather abuse of ardent spirits, and other excesses, so frequently indulged in at such places. This change, however, is not assignable solely to indulgence in excesses, because San Juan is exposed to all the dangerous influences of climate and temperature peculiar to the Mosquito Shore, and all the coast from Cape Gracias à Dios to Cartagena and beyond it.

"The population of the state of Nicaragua may be said not to extend, south only, much beyond the environs of the town of Nicaragua, so that the line of survey approaching it in no part nearer than four leagues, passed over a comparative wilderness, and consequently all provisions were supplied from that place; these are always to be had in abundance, and, should circumstances require it, they could be drawn from other parts of the state to almost any extent. The principal articles of consumption are meat (beef), maize, frijoles, rice, plantains, and fruits, which can be furnished at moderate prices; as for example—meat at three and a half, four, or four and a half reals the arroba of twenty-five pounds (the *real* is equal to sixpence of English money); maize, varying according to seasons, six, eight, or ten, seldom twelve reals per fanega, which weighs about 260 pounds; frijoles and rice in similar proportions; plantains, which are universally used, especially by the labouring classes, are so plentiful that a mule load of them (which is from two to three quintals), can be had throughout the year for two or two and a half reals; so that if a large number of workmen were to be collected in this direction, there would be found no difficulty in supplying them with all the ordinary necessities of life.

"The price paid for labour during the survey amounted to half a real a-day; but this was higher than what is usually given for general field-work, in consideration of the men being taken to a distance from their families for an indefinite time. For work such as that in question, good native artisans would be scarce, but there would be no want of labouring hands, for the certainty and regularity of their pay would attract men, not only from all parts of this, but from the adjoining states of Costa Rica, Honduras, and Salvador also, while a judicious system of equitable regulations would insure their docility and submissiveness. The barbarism that has been attributed to this population in the writings before alluded to, needs no other refutation than saying that the imputation is unfounded; nor is it, nor can it be a supposable fact that the peasantry of the one country should differ very much from that of the other adjoining to it, the same language, habits, and customs being common to both.

"We now come to the communication with the Atlantic by means of the Lake of Nicaragua and the River San Juan. The lake is ninety-five miles long; in its broadest part about thirty, and averages, according to Mr. Baily's soundings, fifteen fathoms of water. The length of the river, by measurement, with all its windings, from the mouth of the lake to the sea, is seventy-nine miles. There are no cataracts or falls; all the obstructions are from rapids, and it is at all times navigable, both up and down, for piraguas drawing from three to four feet of water.

"From the lake to the River of Los Savalos, about eighteen miles, the depth is from two to four fathoms. Here commence the rapids of Toros, which extend one mile, with water from one and a half to two fathoms. The river is then clear for four miles, with an average depth of from two to four fathoms. Then come the rapids of the Old Castle, but little more than half a mile in extent, with water from two to four fathoms. The river is clear again for about two miles, with water from two and a half and five fathoms, where begin the rapids of Mico and Las Balas, connected and running into each other, and both together not more than a mile, with water from one to three fathoms. Then the river is clear one mile and a half to the rapids of Machuca, which extend a mile, and are the worst of all, the water being more broken, from running over a broken rocky bottom. The river then runs clear and without any obstruction for ten miles, with water from two to seven fathoms, to the River San Carlos, and then eleven miles with some islands interspersed, with water

from one to six fathoms, to the River Serapequea, the measurements of one fathom being about the points or bends, where there is an accumulation of sand and mud. It then continues seven miles clear, with water from two to five fathoms, to the Rio Colorado. The River Colorado runs out of the San Juan in another direction into the Atlantic. The loss to the latter, according to measurement taken in the month of May, 1839, was 28,178 cubic yards of water per minute, and in the month of July in the same year, during the rising of the waters, it was 85,840 yards per minute, which immense body might be saved to the San Juan by damming up the mouth of the River Colorado. From this point there are thirteen miles with soundings of from three to eight fathoms. The bottom is of sand and mud, and there are many small islands and aggregations of sand without trees, very easily cleared away. The last thirteen miles might be reduced to ten by restoring the river to its old channel, which has been filled up by collections, at points, of drifted matter. An old master of a piragua told Mr. B—— that within his memory trees grew half a mile back. The soundings were all taken with the plotting scale when the river was low, and the port of San Juan, though small, Mr. Bailly considers unexceptionable.

“The whole length of the canal, from the Lake of Nicaragua to the Pacific, is fifteen and two-third miles. According to the plan, in the first eight miles from the lake but one lock is necessary. In the next mile sixty-four feet of lockage are required. In the next three miles there are about two of deep cutting and one of tunnel, and then a descent of 200 feet in three miles by lockage to the Pacific.

“Thus far of the canal across the Isthmus. The Lake of Nicaragua is navigable for ships of the largest class down to the mouth of the River San Juan. This river has an average fall of one and six-sevenths feet per mile to the Atlantic. If the bed of the river cannot be cleared out, a communication can be made either by lock and dam, or by a canal along the bank of the river. The latter would be more expensive, but on account of the heavy floods of the rainy season it is preferable.

“I am authorised to state that the physical obstructions of the country present no impediment to the accomplishment of this work. A canal large enough for the passage of boats of the usual size could be made at a trifling expense. A tunnel of the length required is not considered a great work in the United States. According to the plan of the Chesapeake and Ohio canal, a tunnel is contemplated upwards of four miles in length. The sole difficulty is the same which would exist in any route in any other region of country, viz., the great dimensions of the excavation required for a ship canal.

“The data here given are of course insufficient for great accuracy, but I present a rough estimate of the cost of this work, furnished me with the plan. It is predicated upon the usual contract prices in the United States, and I think I am safe in saying that the cheapness of labour in Nicaragua will equalise any advantages and facilities that exist here.

“The estimate is—

	dollars.
From the lake to east end of the tunnel	8,000,000 to 10,000,000
Descent to the Pacific	2,000,000 to 3,000,000
From the lake to the Atlantic by canal along the bank of the river	10,000,000 to 12,000,000

20,000,000 to 25,000,000

which is but about the sum contemplated as the cost of our enlarged Erie canal.”

Mr. Stephens remarks—

“In regard to the advantages of this work I shall not go into any details.

“I will remark, however, that on one point there exists a great and very general error. In the documents submitted to Congress before referred to, it is stated that ‘the trade of the United States and of Europe with China, Japan, and the Indian Archipelago, would be facilitated and increased by reason of shortening the distance, about four thousand miles;’ but by measurement on the globe the distance from Europe to India and China

will not be shortened at all. This is so contrary to the general impression that I have some hesitation in making the assertion, but it is a point on which the reader may satisfy himself by referring to the globe. The trade of Europe with India and Canton, then, will not necessarily pass through this channel from any saving of distance; but from conversations with masters of vessels and other practical men, I am induced to believe that by reason of more favourable latitudes for winds and currents, it will be considered preferable to the passage by the Cape of Good Hope. At all events all the trade of Europe, with the western coast of the Pacific and the Polynesian Islands, and all her whale fishing, and all the trade of the United States with the Pacific, without the exception of a single vessel would pass through it; the amount of saving on which, in time, interest of money, navigating expenses and insurance, by avoiding the stormy passage round Cape Horn, I have no data for calculating.

"On broad grounds, this work has been well characterised as 'the mightiest event in favour of the peaceful intercourse of nations which the physical circumstances of the globe present to the enterprise of man.' It will compose the distracted country of Central America, turn the sword which is now drenching it with blood into a pruning-hook; remove the prejudices of the inhabitants by bringing them into close connexion with people of every nation; furnish them with a motive and a reward for industry, and inspire them with a taste for making money, which, after all, opprobrious as it is sometimes considered, does more to civilise and keep the world at peace than any other influence whatever. A great city will grow up in the heart of the country with streams issuing from it fertilising as they roll into the interior; her magnificent mountains and valleys now weeping in desolation and waste will smile and be glad. The commerce of the world will be changed; the barren region of Terra del Fuego be forgotten; Patagonia become a land of fable, and Cape Horn live only in the recollection of sailors and insurers; steamboats will go smoking along the rich coasts of Chili, Peru, Equados, Grenada, Guatemala, California, our own Oregon Territory, and the Russian possessions on the borders of Behring's Straits. New markets will be opened for products of agriculture and manufactures, and the intercourse of communion of numerous and immense bodies of the human race will assimilate and improve the character of nations. The whole world is interested in this work. I would not speak of it with sectional or even national feeling; but if Europe is indifferent, it would be glory surpassing the conquests of kingdoms to make this great enterprise ever attempted by human force entirely our own work.

"I would have gone on immediately, but felt that I might exert myself too far, and break down at an awkward place. In the afternoon, in company with Mr. Baily and Mr. Wood, I walked down to the lake. At the foot of the street by which we entered, built out into the lake, was an old fort, dismantled and overgrown with bushes and trees, a relic of the daring Spaniards who first drove the Indians from the lake;—probably, the very fortress that Cordova built, and in its ruins beautifully picturesque. Under the walls, and within the shade of the fort and trees growing near it, the Indian women of Grenada were washing; garments of every colour were hanging on the bushes to dry, and waving in the wind; women were wading out with their water-jars, passing beyond the breakers to obtain it clear of sand, men were swimming and servants were bringing horses and mules to drink, altogether presenting a beautifully animated picture. There were no boats on the water, but about half-a-dozen piraguas, the largest of which was forty feet long and drew three feet of water, were lying on the shore."—*Travels in Central America, Mr. Baily's Report, &c.*

We have given the foregoing information, being the substance of all that is worth knowing of the materials within our power: not, however, with the expectation that any of the projects are to be soon undertaken, but with the view of showing the practicability of executing a canal across one of the projected lines.

CHAPTER VIII.

ANCIENT RUINS OF CENTRAL AMERICA.

THOSE remarkable ruins which have been discovered in Central America and Yucatan, are generally supposed to have been edifices constructed by races which had become extinct before the discovery of America, and not by any of the nations that were found inhabiting those parts by the first Spanish conquerors.

The accounts given of the population of the countries subdued by Cortez, Alvarado, and other captains, and the researches made since the beginning of the present century, compel us to conclude that all the ruins discovered by M. Dupaix, Del Rio, M. Waldeck, and Mr. Stephens, were built by the nations conquered by the Spaniards, and that they were, in all probability, in a perfect state at the same period.

M. Waldeck had preceded Mr. Stephens to Palenque and Uxmal, and his work was published in folio, with beautiful plates, in Paris, before the work of the latter made its appearance, but not before the drawings in Mr. Stephens' work were completed. The similarity is so striking, that both must be correct; and without the plans and drawings, any description which we could give would be unsatisfactory. Antiquarians must refer, therefore, to the works of M. Dupaix, M. Waldeck, and Mr. Stephens. In each of them there is much to instruct, and much for those to reflect upon who take an interest in the history and destiny of mankind.

We have no doubt of those edifices having been constructed by the same races as the nations conquered by Cortez and Alvarado, notwithstanding the absence of tradition: for the destructive and withering policy of Spain exterminated, or barbarised, the conquered so effectually, as to annihilate even tradition.

The ruins on the sea-coast of Yucatan, visited by Mr. Stephens, were seen and even described as majestic edifices by the Spanish navigators; and from his observations on the ruins of Uxmal, in the interior, they were evidently constructed by the ancestors of the wretched remnants of the aborigines, still, in degradation, inhabiting the country of Yucatan. Near Cape Catoche, the ruins of an entire city have been unmasked. There are two pyramids on the banks of the Rio Lagertos, nearly concealed by the trees grown on them. Tumuli are found near Campeachy, in other parts of Yucatan; and near them articles of *terra cotta*, and human heads curiously wrought, are found. In other places, as at Champoton, ruins have been discovered nearly covered with a dense forest of

strong vegetation. The ruins of Cozumel, near the sea, are of vast extent. Traces of many others have been discovered, but Yucatan is still but imperfectly explored. At Uxmal the examinations of Mr. Stephens and M. Waldeck have been published, and the plates, and descriptions, are very remarkable.

Of the ruins in Central America, those of Copan were the first visited by Mr. Stephens.

COPAN is within that portion of the State of Honduras, which comprises one of the most fertile valleys or basins in Central America. It is still famed for the excellent quality of its tobacco. The ruins stand, or lie, on the left bank of an unnavigable river, the River Copan, a tributary of the Motagua.

The ruins, as far as yet known, extend along the river more than two miles. One monument has been discovered on the opposite side, at about a mile from the river. It stands on the summit of a mountain 2000 feet high.

The ruin near the river, which Mr. Stephens named the *Temple*, is, he says, "an oblong enclosure. The front or river wall extends on a right line north and south 624 feet, and it is from sixty to ninety feet in height. It is made of cut stones, from three to six feet in length, and a foot and a half in breadth. In many places the stones have been thrown down, by bushes growing out of the crevices; and in one place there is a small opening, from which the ruins are sometimes called by the Indians *Las Ventanas*, or the windows. The other three sides consist of ranges of steps of pyramidal structure, rising from thirty to 140 feet in height on the slope. The whole line of survey is 2866 feet, which, though gigantic, and extraordinary for a ruined structure of the aborigines, that the reader's imagination may not mislead him, I consider it necessary to say, is not so large as the base of the great Pyramid of Ghizeh."

Mr. Stephens has drawn a plan according to his survey, which illustrates the ground-plan of this edifice, which is regularly laid out at right angles. In his description of these ruins, he says,

"To begin on the right; near the south-west corner of the river wall is a recess, which was probably once occupied by a colossal monument fronting the water. Beyond, are the remains of two small pyramidal structures, to the largest of which is attached a wall running along the west bank of the river; this appears to have been one of the principal walls of the city; and between the two pyramids there seems to have been a gateway, or principal entrance, from the water.

"The south wall runs at right angles to the river, beginning with a range of steps about thirty feet high, and each step about eighteen feet square. At the south-east corner is a massive pyramidal structure, 120 feet high on the slope. On the right are other remains of terraces and pyramidal buildings; and here, also, was probably a gateway, by a passage about twenty feet wide, into a quadrangular area, 250 feet square, on two sides of which are massive pyramids, 120 feet high on the slope.

"At the foot of these structures, and in different parts of the quadrangular area, are numerous remains of sculpture. At one point, marked E, is a colossal monument, richly sculptured, fallen and ruined: behind it, fragments of sculpture, thrown from their places by the trees, grown up, are strewed and lying loose on the side of the

pyramid, from the base to the top, and among them our attention was forcibly arrested by rows of death's heads, of gigantic proportions, still standing in their places about half way up the side of the pyramid: the effect was extraordinary.

"Of the moral effect of the monuments themselves, standing, as they do, in the depths of a tropical forest, silent and solemn, strange in design, excellent in sculpture, rich in ornament, different from the works of any other people, their uses and purposes, their whole history, so entirely unknown, with hieroglyphics explaining all, but perfectly unintelligible, I shall not pretend to convey any idea. The tone which pervades the ruins is that of deep solemnity. An imaginative mind might be infected with superstitious feelings. From constantly calling them by that name in our intercourse with the Indians, we regarded these solemn memorials as 'idols'—deified kings and heroes—objects of adoration and ceremonial worship."

Mr. Stephens was unable to discover on these monuments, or on the sculptured fragments, any delineations of human or other sacrifice, but he considered the large sculptured stone invariably found before each "idol," as having been used as a sacrificial altar. The form of sculpture most frequent was a death's head, sometimes the principal and sometimes only an accessory ornament: whole rows of these heads on the outer wall, "adding gloom to the mystery of the place, keeping before the eyes of the living death and the grave, presenting the idea of a holy city—the Mecca or Jerusalem of an unknown people."

As to the age of these desolate ruins he offers no conjecture, nor does he consider as data the accumulations of earth and the gigantic trees growing on the top of the ruins; neither could he discover any tradition of its depopulation or its ruin.

No trace was found as to whether the agents of destruction, or desolation, were the sword, or famine, or pestilence. "The trees," he says, "which shroud it may have sprung from the blood of its slaughtered inhabitants. One thing I believe, that its history is graven on its monuments. No Champollin has yet brought to them the energies of his inquiring mind. Who shall read them?"

He almost doubts that this is the place referred to by the Spanish historian as conquered by Hernandez de Chaves. He considers, however, that at that time its broken monuments, terraces, pyramidal structures, portals, walls, and sculptured figures, were entire, and they were all painted.

The silence of the Spaniards may, however, be accounted for from the well-known fact that they were nearly all illiterate, and ignorant, adventurers—thirsting chiefly for gold and the precious metals, and regardless of every other object. Even if reports were made by them, the government of Spain would have suppressed all information which would have attracted the attention of other European nations to America.

RUINS OF QUIRIGUA.—Mr. Catherwood, leaving the road and continuing through the forest toward the north-east for about three-quarters of an hour, reached the foot of a pyramidal structure, similar to those at Copan, with the steps in some places perfect. He ascended to the top (about twenty-five feet), and descending on the other side by steps, he discovered at a short distance from the pyramid a colossal head, six feet in diameter. It was nearly concealed by an

enormous tree. Near it was a large altar. Both were within the same enclosure, and so covered with moss that he fancied it impossible to make any thing out of it.

To the north, about three or four hundred yards from the pyramid, he found several monuments of the same general character with those at Copan, but twice or three times as high.

Mr. Stephens says,—

“Of one thing there is no doubt, a large city once stood there ; its name is lost, its history unknown ; and except for a notice taken from Mr. C.’s notes, and inserted by the Senores Payes in a Guatemala paper after the visit, which found its way to this country and Europe, no account of its existence has ever before been published. For centuries it has lain as completely buried as if covered with the lava of Vesuvius. Every traveller from Yzabal to Guatemala has passed within three hours of it—we ourselves had done the same—and yet there it lay, like the rock-built city of Edom, unvisited, unsought, and utterly unknown.”

RUINS OF PALENQUE.—A short distance from the village of Palenque the River Chacamal separates it from the country of the *unbaptised Indians*, who at this place are called **KHARIBEES**.

The ruins of Palenque are distant about eight miles from the village, amid a desolate forest region. Mr. Stephens found the road was so bad that, in order to make explorations, it was necessary for him to remain at the ruins. He had great difficulty in procuring provisions.

It is said of these ruins, that in 1750 a party of Spaniards penetrated to the country north of the district of Carmen, in Chiapa, when they suddenly discovered in the midst of the forest wilderness, ancient stone edifices, the remains of a city, spread over a country of from eighteen to twenty-four miles in extent, and called by the Indians *Casas de Piedras*.

On this story, Mr. Stephens remarks,—

“From my knowledge of the country I am at a loss to conjecture why a party of Spaniards were travelling in that forest, or how they could have done so. I am inclined to believe rather that the existence of the ruins was discovered by the Indians, who had clearings in different parts of the forest for their corn-fields, or perhaps was known to them from time immemorial, and on their report the inhabitants were induced to visit them.”

The existence of such a city was entirely unknown in Europe ; there is no mention of it in any book, until that published by Dupaix, of which Lord Kingsborough’s volumes, in regard to Palenque, is a transcript. Colonel Galindo’s communications to the Geographical Society of Paris, are incorporated in the works of Dupaix. M. Waldeck, with funds contributed by an association in Mexico, passed two years amidst these ruins. His drawings were taken away by the Mexican government, but he had retained copies.

In regard to the extent of the ruins of Palenque, Mr. Stephens observes,

“The Indians and the people of Palenque say, that they cover a space of sixty miles ; in a series of well-written articles in our own country, they have been set down as ten times larger than New York ; and lately I have seen an article in some of the

newspapers, referring to our expedition, which represents the city discovered by us, as having been three times as large as London !

"The Indians and people of Palenque really know nothing of the ruins personally, and the other accounts do not rest upon any sufficient foundation. The whole country for miles around is covered by a dense forest of gigantic trees, with a growth of bush and underwood unknown in the wooded deserts of our own country, and impenetrable in any direction except by cutting a way by a *machete*. What lies buried in the forest it is impossible to say of my own knowledge : without a guide, we might have gone within a hundred feet of all the buildings without discovering one of them.

"Captain Del Rio, the first explorer, with men and means at command, states in his report, that in the execution of his commission, he cut down and burnt all the woods : he does not say how far, but judging from the breaches and excavations made in the interior of the buildings, probably for miles around. Captain Dupaix, acting under a royal commission, and with all the resources such a commission would give, did not discover any more buildings than those mentioned by Del Rio, and we saw only the same : but having the benefit of them as guides, at least of Del Rio (for at that time we had not seen Dupaix's work), we of course saw things which escaped their observation, just as those who come after us will see what escaped ours."

A description of the building or ruin which Mr. Stephens chose to live in, was called the palace.

"It stands," he says, "on an artificial elevation of an oblong form, forty feet high, 310 feet front and rear, and 260 feet on each side. This elevation was formerly faced with stone, which has been thrown down by the growth of trees, and its form is hardly distinguishable.

"The building stands with its face to the east, and measures 228 feet front, by 180 feet deep. Its height is not more than twenty-five feet, and all around it had a broad projecting cornice of stone. The front contains fourteen doorways, about nine feet wide each, and the intervening piers are between six and seven feet wide. On the left (in approaching the palace) eight of the piers have fallen down, as has also the corner on the right, and the terrace underneath is cumbered with the ruins. But six piers remain entire, and the rest of the front is open.

"Another portion was enclosed by a richly-ornamented border, about ten feet high and six wide, of which only a part now remains. The principal personage stands in an upright position and in profile, exhibiting an extraordinary facial angle of about forty-five degrees. The upper part of the head seemed to have been compressed and lengthened, perhaps by the same process employed upon the heads of the Choctaw and Flat-head Indians of our own country. The head represents a different species from any now existing in that region of country ; and supposing the statues to be images of living personages, or the creations of artists according to their ideas of perfect figures, they indicate a race of people now lost and unknown. The head-dress is evidently a plume of feathers ; over the shoulders is a short covering, decorated with studs and a breast-plate ; part of the ornament of the girdle is broken ; the tunic is probably a leopard's skin ; and the whole dress, no doubt, exhibits the costume of this unknown people. He holds in his hand a staff or sceptre, and opposite his hands are the marks of three hieroglyphics, which have decayed or been broken off. At his feet are two naked figures, seated cross-legged, and apparently suppliants. The hieroglyphics doubtless tell its story. The stucco is of admirable consistency, and hard as stone. It was painted, and in different places about it we discovered the remains of red, blue, yellow, black, and white.

"The piers, which are still standing, contained other figures of the same general character, but which, unfortunately, are more mutilated, and from the declivity of the terrace it was difficult to set up the camera lucida in such a position as to draw them. The piers which are fallen were no doubt enriched with the same ornaments. Each one had some specific meaning, and the whole, probably, presented some allegory or history ; and when entire and painted the effect in ascending the terrace must have been imposing and beautiful.

"The whole court-yard was over-grown with trees, and it was incumbered with ruins several feet high, so that the exact architectural arrangements could not be seen."

He ascended a neighbouring mountain so steep that he was obliged to haul himself up by the branches. On the top was a high mound of stones, with a foundation-wall still remaining. Probably a tower or temple had stood there, but the woods were so thick below that he could perceive no ruins.

The hieroglyphics at Palenque are the same as those at Copan and Quimigua, and although those places are occupied by races of Indians speaking different languages and unintelligible to each other, there is no reason to doubt but that they originally used the same hieroglyphics, or written character. He says—

"There is no staircase or other visible communication between the lower and upper parts of this building (the temple), and the only way of reaching the latter was by climbing a tree, which grows close against the wall, and the branches of which spread over the roof. The roof is inclined, and the sides are covered with stucco ornaments, which, from exposure to the elements and the assaults of trees and bushes, are faded and ruined, so that it was impossible to draw them; but enough remained to give the impression that when perfect and painted they must have been rich and imposing. Along the top was a range of pillars eighteen inches high and twelve apart, made of small pieces of stone laid in mortar and covered with stucco, crowning which is a layer of flat projecting stones, having somewhat the appearance of a low, open balustrade.

"In front of this building, at the foot of a pyramidal structure, is a small stream, part of which supplies the aqueduct before referred to. Crossing this, we come upon a broken stone terrace, about sixty feet on the slope, with a level esplanade at the top, 110 feet in breadth, from which rises another pyramidal structure, now ruined and overgrown with trees; it is 134 feet high on the slope, and on its summit is a building like the first shrouded among trees.

"This building is fifty feet front, thirty-one feet deep, and has three door-ways. The whole front was covered with stuccoed ornaments. The two outer piers contain hieroglyphics; one of the inner piers is fallen, and the other is ornamented with a figure in bas-relief, but faded and ruined.

"At about a mile and a half from the village, we came to a range of elevations extending to a great distance, and connected by a ditch, which had evidently formed the line of fortifications for the ruined city. They consisted of the remains of stone buildings, probably towers, the stones well cut and laid together, and the mass of rubbish around abounded in flint arrow-heads. Within this line was an elevation which grew more imposing as we approached, square, with terraces, and having in the centre a tower, in all 120 feet high. We ascended by steps to three ranges of terraces, and on the top entered an area enclosed by stone walls, and covered with hard cement, in many places still perfect. Thence we ascended by stone steps to the top of the tower, the whole of which was formerly covered with stucco, and stood as a fortress at the entrance of the great city of Utatlan, the capital of the Quichi Indians.

"This was the first appearance of strangers in Utatlan, the capital of the great Indian kingdom, the ruins of which were now under our eyes, once the most populous and opulent city, out of the whole kingdom of Guatemala.

"The padre asserted, that four days on the road to Mexico, on the other side of the great sierra, was a living city, large and populous, occupied by Indians precisely in the same state as before the discovery of America. He had heard of it many years before at the village of Chajul, and was told by the villagers that from the topmost ridge of the sierra this city was distinctly visible. He was then young, and with much labour climbed to the naked summit of the sierra, from which at a height of ten or twelve thousand feet, he looked over an immense plain extending to Yucatan and the Gulf of Mexico, and saw at a great distance, a large city spread over a great space, and with turrets white and glittering in the sun. The traditionary accounts of the Indians of Chajul is, that no white

man has ever reached this city; that the inhabitants speak the Maya language, are aware that a race of strangers has conquered the whole country around, and murder any white man who attempts to enter their territory. They have no coin or circulating medium; no horses, cattle, mules, or domestic animals, except fowls, and the cocks they keep under ground to prevent their crowing being heard.

"If he is right, a place is left where Indians and an Indian city exist as Cortez and Alvarado found them; there are living men who can solve the mystery that hangs over the ruined cities of America; perhaps, who can go to Cospan and read the inscriptions on its monuments. No subject more exciting and attractive presents itself to my mind, and the deep impression of that night will never be effaced.

"Can it be true? being now in my sober senses. I do verily believe there is much ground to suppose, that what the padre told us is authentic. That the region referred to does not acknowledge the government of Guatemala, has never been explored, and that no white man ever pretends to enter it I am satisfied. From other sources we heard that, from that sierra a large ruined city was visible, and we were told of another person who had climbed to the top of the sierra, but on account of the dense cloud resting upon it, had been unable to see any thing. At all events the belief at the village of Chajul is general, and a curiosity is roused that burns to be satisfied."

CHAPTER IX.

AGRICULTURE OF CENTRAL AMERICA.

THE productions of the soil of Central America both agricultural and natural, are as varied as the climate. On the higher table-lands wheat, barley, and the rare fruits and vegetables of Europe are grown. Indian corn is also raised, as the principal article of food; in some parts rice is grown. The common fruits and vegetables are apples, pears, peaches, apricots, grapes, and oranges; melons, beans, kidney-beans, peas, barbanzas, or Spanish peas, lentils, potatoes, turnips, cabbages, and pumpkins. From the *maquay*, as in Mexico, a spirituous liquor is distilled. (See abstracts from the works of Mr. Stephens and Mr. Roberts.)

In the lower plains and valleys the soil yields annually two crops of Indian corn; sugar-cane, bananas, mandioca, pine-apples, cocoa-nuts, sapotes, and sweet potatoes, are all cultivated, or grow naturally. Indigo, cochineal, tobacco, and cotton are cultivated. Indigo is chiefly grown between the table-land of Honduras and the Pacific, in the state of Salvador, in the neighbourhood of San Vicente and San Miguel. Cochineal is gathered on the table-land of Guatemala, which, and on the plains of Oaxaca, in Mexico, are the two places where the cochineal insect is found most abundant. Tobacco has always been a government monopoly, and the culture has been consequently very limited. The cacao, once grown in Soconusco, was considered so far superior to all others that the Spanish court retained it for its exclusive use. The quantities of cacao now raised in all Central America is said not to be sufficient for the domestic consumption. Sugar, in small plantations, is raised in many parts, for home consumption; small quantities of it are exported to Peru. Coffee is

said not to be used in the country by the Spanish or native race, and there are but a few coffee plantations, which yield enough for the use of foreign residents.

The haciendas resemble those of Mexico, but vary according to their production. Mr. Stephens says of one of these on which cochineal was produced, near Old Guatemala,

“ In the yard were four oxen grinding sugar-cane, and behind was the *nopol*, or cochineal plantation, one of the largest in the Antigua. The plant is a *species of cactus*, set out in rows like Indian corn; and at the time I speak of, it was about four feet high. On every leaf was pinned with a thorn a piece of cane, in the hollow of which were thirty or forty insects. These insects cannot move, but breed, and the young crawl out and fasten upon the leaf; when they have once fixed they never move; a light film gathers over them, and as they feed the leaves become mildewed and white. At the end of the dry season some of the leaves are cut off and hung up in a storehouse for seed, the insects are brushed off from the rest and dried, and are then sent abroad to minister to the luxuries and elegances of civilised life, and enliven, with their bright colours, the salons of London, Paris, and St. Louis in Missouri. The crop is valuable, but uncertain, as an early rain may destroy it; and sometimes all the workmen of a hacienda are taken away for soldiers at the moment when they are most needed for its culture. The situation was ravishingly beautiful, at the base and under the shade of the Volcano de Agua, and the view was bounded on all sides by mountains of perpetual green; the morning air was soft and balmy, but pure and refreshing; with good government and laws, and one's friends around, I never saw a more beautiful spot on which man could desire to pass his allotted time on earth.”

When the country around Guatemala was taken possession of by the Spaniards, the lands around the capital were partitioned out among the *Canonigos*. Indians were allotted them as *adscripti Glebae* to cultivate the soil. A village was formed, and the name of the *Canonigo* given to it. A church was then erected, and near it a large house for the ecclesiastic. In this way many parts were at an early period cultivated. Another hacienda, at which Mr. Stephens stopped, was in a large clearing, surrounded with forest. It had a *cosina* and sheds, and a large sugar-mill. In the evening twenty or thirty workmen, principally Indians, came to the masters to give an account of their day's work, and receive orders for the next. The proprietors of this hacienda were two brothers. They gave him for supper, on a small table placed between his hammock and one of the beds, fried eggs, *frijoles*, or black-beans, and tortillas; but, as usual in the country, without knife, fork, or spoon.

The hacienda of a Dr. Drivon, about a league from Zonzonate, he describes as one of the finest haciendas in the country. The doctor had imported a large sugar-mill, and was preparing to manufacture sugar upon a larger scale than was known in any other part of the country. He came from the island of St. Lucia to this place, and he was well acquainted with Europe, and with all the West India Islands.

A Mr. Bridges, an Englishman, from one of the West India Islands, who had been resident in Central America many years, was married to a lady of Leon, and, on account of the disordered state of government, lived on his hacienda;

the soil of which was fertile. He informed Mr. Stephens, that fifty men on his grounds *could* manufacture sugar cheaper than two hundred in the West India Islands; but that no reliance could be placed upon Indian labour.

LIVE STOCK.—Cattle in immense herds are reared on the pastures. In the plains of Honduras, and on the eastern districts of Nicaragua, there are cattle farms, on which are herds from 10,000 to 40,000 oxen, bulls, and cows. Horses and mules are bred for riding and for burden; but they are never shod, except a few for riding in the city of Guatemala. Sheep are reared on the upper plains, and swine are reared for the flesh.

CHAPTER X.

MANUFACTURES.

MANUFACTURING industry is in the rudest state in Central America. Ordinary articles are made of leather, cotton, wood, and metals. The wretched condition of the country renders every investment of capital insecure, and considering the fertility of the land for producing raw materials for exportation, it would be unwise to attempt manufacturing articles which can be imported from other countries, at half the cost at which they could be produced in any part of Central America. On the way to Realejo, Mr. Stephens visited the *maquina*, or the only cotton factory in the country. It was established by a citizen of the United States.

On the way to Realejo he visited a *maquina*, or cotton-factory, of which he had heard much on the road. It was the only one in the country, and owed its existence to the enterprise of a countryman, having been erected by a Mr. Higgins, who, disappointed in his efforts, and disgusted with the people, sold it to a Don Francisco and a Mr. Foster. Mr. Stephens says,

“They were sanguine in their expectations of profit; for they supposed, that by furnishing a market, the people would be induced to raise cotton enough for exportation to Europe. The resources of this distracted country are incalculable. Peace and industry would open fountains which would overflow with wealth; and I have no doubt the influence of this single factory will be felt in quieting and enriching the whole district within its reach.”

Mr. Stephens has been no prophet in these remarks. If the country were inhabited by people from the United Kingdom, or from Massachusetts, his expectations would have been realised.

TRADE AND NAVIGATION.

Of the trade and navigation of this country, no statistical account can be obtained. Small vessels from the West Indies and the United States, and occasionally from Europe, frequent the coasts, and carry on a trade, chiefly contra-

band, in consequence of the pernicious system of high duties, which the government of the day, in some mischievous form or other, has attempted to establish. Vessels from the western coasts of America also land various articles. Costa Rica has separated from the other states. Salvador may also be said to act independently. Guatemala is still under the sway of the Indian Carrera. Nicaragua has its separate misrule, and Honduras has published its distinct administration, and customs' laws. The tonnage duties for anchorage are four reals, or about two shillings, per ton for native vessels, and double that amount for foreign vessels. These were the rates established in 1837 for all the other states. Export duties, as well as import, are also attempted to be levied, but at such irregular and changeable rates, that we have not been able to procure correct data to enable us to give tabular statements or tariff for any of the states of Central America. (*See Statistics of the Spanish American Republics hereafter.*)

CHAPTER XI.

NEW GRANADA.

THE republic of New Granada after its separation from the Confederation, which, under the name of Columbia, included Venezuela, Ecuador, and New Granada, comprises the north-western region of South America, and extends from the boundary of Central America to that of the more recently constituted republic of Ecuador. New Granada may, therefore, be considered as extending north from near the equinoctial line, to nearly 12 deg. north latitude, and east to west from about 70 deg. to 83 deg. west longitude. The interior limits, as well as the country, may be considered, as very imperfectly defined.

The area of New Granada is vaguely stated at 380,000 square miles; its greatest length, about 800 miles; the greatest breadth from the Rio Orinoco, between the mouths of the rivers Guaviare and Meta, to the Pacific, at about 600 miles.

On the east it borders on the republic of Venezuela: on the north is the Gulf of Darien and the Caribbean Sea; and near the western limit of the republic, the Laguna de Chiriqui. The not well defined boundary of Central America separates New Granada, or rather Veragua, by a line over the Isthmus of Panama, from the Caribbean Sea, a few miles west of the Laguna de Chiriqui, to Cape Boruca on the Pacific. The latter bounds New Granada south to Ecuador.

The western and Central Andes, are the great mountain ranges which spread over the country between 5 deg. and 8 deg. N. latitude, east of the Rio Magdalena. The basins of the rivers Magdalena, Cauca, Atrato, San Juan, and several other

rivers and streams, are comprised within New Granada. Along the shores of the Caribbean Sea, the lands are generally low, from the mouths of the Rio Magdalena to the Rio Atrato. The isthmus of Panama and Veragua, though politically but loosely connected with the republic, are comprised within New Granada. About one-third of the Eastern Andes, or Great Cordillera, are also within this state. Of the great plains, termed the Llanos, a great portion belongs to New Granada. In the south-western parts are situated the mountain-region of Los Pastos, and the basin of the Rio Patia. These diversified regions vary greatly in climate, fertility, and productions.

The region west of the lake of Maracaybo is said to be fertile, with a healthy climate, and either covered with forests, or spreading into prairies and pastures. It is very thinly settled. The páramos of the Andes are extensive table-lands, on the summits of the range, nearly without vegetation; the lower districts are fertile, and the climate favourable to the cultivation of European grain and fruits: in the lower north-western districts, near the basins, all tropical plants thrive, and these districts are comparatively populous. The declivities of the Central Andes are said to be barren. The mountain region east of the Magdalena is arid, the soil rocky, and but little settled or cultivated. It is said to be rich in gold and silver. The lands along the Caribbean Sea are generally described as fertile, the greater part as alluvial, and very unhealthy. Except along the banks of the Rio Magdalena, it is thinly settled. It is generally covered with forest, and produces all tropical plants. The eastern districts of the Isthmus of Panama and Veragua are covered with wood, fertile, unhealthy, and thinly inhabited; to the west of which prairies occur, and the up lands are fertile, more salubrious, and more populous. The region along the Pacific, west of the Andes and south of latitude 5 deg. N., is chiefly covered with dense forests, subject to incessant rains, excessive heat, and an intermitting climate. The mountain region of Los Pastos is in few parts fit for the cultivation of wheat or maize, but affords good pastures. In some of the valleys the grain crops of Europe will grow. The Llanos, north from the Rio Vichada, is similar to, and, in fact, a continuation of, the cattle plains of Carácas and Varinas, and affords pasture to numberless herds of cattle and horses. The southern Llanos are described as covered with forests, or intermingled with extensive swamps. They are inhabited by native tribes, and are considered very unhealthy.

RIVERS.—Several tributaries of the Orinoco are navigable, but they are scarcely ever used. The Meta, and its tributary, the Cazanare, are navigated. The Magdalena, and its tributaries, the Rio Cesare, which flows from the lake of Zapatosa, the Canaverales, the Sogamozo, and the Rio Negro, are navigated. These rivers flow into the Magdalena from the east. The Cauca, and the Atrato and its tributaries, are navigated. The Sinú is navigable as far as Lórica, the

Chagres up to Cruces, and the San Juan to Novita. The Rio Patia, for some distance, is navigated; small craft only are used, and even the Magdalena, though called the Danube of New Granada, is said to be interrupted by shallows. We have, however, but a very imperfect knowledge of these rivers, as well as of New Granada generally.

Numerous small and generally deep lakes occur on the slopes of the mountain ridges and on the páramos; large lakes are not numerous in the interior. The Lake of Zapatosa is scarcely known. North of the town of Bogotá, a lake occupies the greater part of a plain about seventy miles long, and more than fifteen wide, but it is shallow, no part being more than six feet deep. The Lake Sebondoy, in the mountain region of Los Pastos, is considered as the source of the Rio Putumayo, an affluent of the Amazonas. Within the shores of the Caribbean Sea there are several lagoons, into which the sea flows. The Lagoon de Santa Marta, by means of which a water communication between Santa Marta and the Rio Magdalena is carried on; and the Cienega de Tosca, north-east of Cartagena, (more than forty-five miles long), are the largest.

CLIMATE.—The páramos, the elevated table-land of Bogotá, the vales of the Magdalena and Cauca, and low districts along the Caribbean Sea and the Pacific, the mountain regions have each its respective climate, and its variety of productions. European grains, potatoes, are cultivated on the table-land of Bogotá, in the districts north, and along the western declivity of the Eastern Andes. In the basins of the great rivers, and on the low lands along the sea-coast, maize, plantains, many vegetables, and fruits, cotton, cacao, tobacco, and some sugar, are cultivated. The forests yield many useful woods; among others, the brasiletto and fustic, from the forests bordering the Sierra de Santa Marta. Ipecacuanha grows on the banks of the Rio Magdalena; cinchona on the Sierra de Santa Marta, the Andes of Merida, Santa Fé, and Popayan; the balsam of Tolù on the banks of the Rio Sinú. The plains of Cazanare pasture immense herds of cattle, which yield supplies of jerked beef and hides. Pearls were formerly fished in the sea opposite the mouth of the Rio Hacha, and a small quantity are still procured in the Bay of Panama.

MINERALS.—Gold is found in the Central and Western Andes. In the vale of the Rio Cauca it is procured by washing the sand of rivers and some alluvial soils. In the mountain region of Antioquia it is got by mining; it abounds still more in the countries along the Pacific, and occurs also in the Rio Zulia, and the Rio Hacha. Platinum is found along the Pacific, in the provinces of Chocò and Barbacoas. Silver is discovered less abundantly, and only in a few places in the Central Andes, near the mountain-pass of Quindìu, and on the banks of the Rio Sinú. Iron ore and copper ore have been found in several places, especially in the mountains of Antioquia, but they are not worked; tin and lead are also found;

emeralds are abundant in a river north of the town of Bogotá, but they are generally small; coal occurs in abundance on the plain of Bogotá, and is also found on the banks of the Rio Sinú. According to Humboldt, a stratum of rock-salt traverses the Eastern Andes, between 5 deg. and 6 deg. north latitude, from south-west to north-east; it is worked at its extremities, at Zipaquirá, on the plain of Bogotá, and at Chita, in the Llanos of Cazanare.

INHABITANTS.—The inhabitants of New Granada consist of the descendants of Spaniards, Indians, negroes, and the mixed races. The negroes and Zamboes were formerly numerous in the mining districts of Antioquia and along the Pacific, but both races have been much reduced by the war of independence. At the time of the arrival of the Spaniards, an Indian tribe, the Muyscos, inhabiting the table-land of Bogotá, and the adjacent countries, had attained a considerable degree of civilisation, and their descendants still inhabit the western declivity of the Eastern Andes, and the vale of the Upper Magdalena. The inhabitants of the mountain-region of Los Pastos are described as of Peruvian race. The Indians who have been baptised by the missionaries inhabit the north-eastern part of New Granada, between the Lake of Maracaybo and the town of Cartagena, and also the lower vale of the Cauca. In the upper vale of that river there are few or no Indians. The native tribes along the Pacific, do not appear to have much improved since the arrival of the Spaniards, those of the Isthmus of Panama, we have already described as independent, and in a state of hostility to the Spanish race. The Cattle Plains are mostly peopled by mixed races, especially Mestizos, and the Wooded Plains are in the possession of native tribes.

POPULATION.—According to a census published in 1827, the whole population amounted to 1,270,000 inhabitants. The number was some time after estimated at 1,360,000 inhabitants, distributed among the five PROVINCES as follows:

P R O V I N C E S.	Area in Square Miles.	Inhabitants.	Inhabitants on a Square Mile.
	number.	number.	number.
Istmo	25,000	100,000	4
Magdalena	50,900	250,000	5
Boyacá	83,000	450,000	5½
Cundinamarca	152,800	370,000	less than 2
Cauca	68,300	190,000	3
Total	380,000	1,360,000	

The most populous districts are the central portions of Boyacá and Cundinamarca, and the province of Veragua; the vale of the Rio Magdalena and the upper vale of the Rio Cauca are much less populous. The other parts are thinly inhabited, and with the exception of a few small native tribes, the Wooded Plains contain no inhabitants at all.

The department of Istmo contains the provinces of Panamá and Veragua, already described.

The department of the Rio Magdalena comprehends the countries from the boundary of Venezuela westwards along the sea to the Gulf of Darien and the basin of the Rio Atrato, and is divided into the provinces of Rio de la Hacha, Santa Marta, Cartagena, and Mompox. It is only tolerably well settled along the coast and along the course of the Rio Magdalena: in the other districts there are scattered Indian families. Besides the Rio Magdalena and the Rio Cauca, the rivers Cesare and Cañaverales, two affluents of the Magdalena, and the Rio Sinú flow through this department. The products are cotton, cacao, tobacco, ipecacuanha, cinchona from the Sierra de Marta, balsam of Tolu, and dye-woods. Some of the rivers deposit gold dust, but it is not collected. Cartagena, with an inlet thirty-three miles in length, is formed by the islands of Tierra Bomba and of Barú: has three entrances, Bocca Grande, Bocca Chica, and the Estero de Pasacaballos. The Bocca Chica, through which vessels usually enter, is between seventeen and eighteen feet deep, and admits large vessels; it is twenty-eight miles below the town. Cartagena is well built and fortified. Its population is estimated at 18,000. The Estero de Pasacaballos is navigated by small vessels, but only for three months of the year. Baranca Nueva is situated where the Digue de Mahates enters the Magdalena, at which the goods brought from Cartagena are embarked on the Magdalena, and those which come down that river are disembarked. *Santa Marta* has a tolerably good harbour; it exports a great quantity of dye-woods. By means of the Cienega de Santa Marta, and some other lakes which are united by natural channels, imported goods are forwarded to the Rio Magdalena: the population of Santa Marta is estimated at 8000. Cuidad de la Hacha is situated near the boundary of Venezuela, and has a small harbour adapted for vessels of light burden. Mompox on the banks of the Rio Magdalena, with a population of about 10,000, is the depôt of the foreign goods destined for the basin of that river. Loricá stands on the banks of the Rio Sinú, at the place where it begins to be navigable; it has 1000 inhabitants, and some trade. Ocaña, not far from the mountains of that name, has 5000 inhabitants, and some inland trade, the goods are transported by the River Cañaverales.

The department of Boyàca comprises the Eastern Andes between the plain of Bogotà, the boundary of Venezuela, and the Cattle Plains of Cazanare; it is divided into the provinces of Pamplona, Socorro, Tunja, and Cazanare. The first three are situated along the mountain-regions, and are considered the best settled parts of New Granada. Wheat, cacao, cotton, coffee, tobacco, and indigo are collected and exported from the northern districts. At Chita there are mines of rock salt. On the Llanos are pastured the cattle, which are killed for jerked beef and ox-hides. The Rio Magdalena forms its western boundary, and the navigable streams of Sogamozo, Zulía, and Cazanare and Meta flow through this department. The inhabitants are chiefly whites or half-breeds: the number of

pure Indians is small. Il Rosario de Cúcuta is situated on the banks of the Rio Zúlia, a few miles above, where it becomes navigable, and near the boundary of Venezuela. It is the depôt for the produce of the surrounding districts, which is shipped for Maracaybo to be exported. Its population is estimated at 5000; cacao is grown in the neighbourhood. Salazar de las Palmas is situated in the midst of plantations of cacao. Pamplona rises on a table-land, on the northern declivity of the Andes, 8000 feet above the sea-level. In the neighbourhood there are some mines of gold: estimated population 4000. La Grita, situated in a tolerably well cultivated district, has a trading intercourse with Maracaybo. Girona, near the banks of the Cañaverales, carries on trade with Mompox: excellent tobacco is grown in the vicinity. Socorro, built on the declivity of a mountain, has about 12,000 inhabitants, and manufactures coarse cotton stuffs and straw-hats. Tunja, not far from the boundary of the department of Cundinamarca, is the capital of Boyàca, and contains about 7000 inhabitants. On the Llanos of Cazanare are situated the villages of Cazanare, Poré, and Chita.

The department of Cundinamarca comprehends the whole of the mountain-region of Antioquia, the upper vale of the Rio Magdalena, the Eastern Andes as far north as 5 deg. north latitude, and the Wooded Plains: it is divided into the provinces of Antioquia, Mariquita, Neyva, and Bogotá. On the plain of Bogotá, European wheat and other grains, and the aracacha root, are grown; the other districts yield tropical grains and plants. The cacao of the upper vale of the Rio Magdalena, is of excellent quality. There are mines of gold and silver in the north districts, and salt and coal are found in the Andes. The Rio Grande, a tributary of the Magdalena, is navigable. Several streams flowing into the Orinoco and negro are also navigable, but they are little used. The inhabitants consist of whites, Indians, and mixed races, nearly in equal proportions. Antioquia, on the banks of the Rio Cauca, and in the neighbourhood of some mines, has about 4000 inhabitants. Santa Rosa, a small place, has gold mines. Madellin, the capital, is situated in a fertile valley. It is estimated to have 9000 inhabitants. Mariquita is a small town, near some gold mines. Honda is a trading-place, near the confluence of the Rio Guali with the Rio Magdalena. Ibague, situated at the point where the Pass of Quindú crosses the Central Andes, has about 5000 inhabitants. Excellent tobacco is cultivated near Ambalema. Neyva, on the Rio Magdalena, has about 3000 inhabitants, and is the commercial depôt of the higher vale of the Rio Magdalena. Timana, near the source of the Rio Magdalena, yields excellent cacao.

SANTA FÉ DE BOGOTÀ, the capital of New Granada, stands on the east side of the spacious and fertile plain of Bogotá, 8958 feet above the sea, and 8280 feet above the surface of the Rio Magdalena at Honda. Behind the city the mountain rises nearly 2000 feet, almost perpendicular, and near the summit are

situated the convents of Montserrat and Guadalupe. The town is regularly built, but the houses are low, on account of the frequent earthquakes. The palace of the former viceroys is inhabited by the president of the republic: the senate assembles in a wing of the convent of the Dominicans, and the chamber of representatives in a private residence. The cathedral was a superb edifice, but it was nearly ruined by an earthquake, in 1827. The University consists of three colleges, all well situated and built. The population is estimated at between 30,000 and 40,000. This town owes its chief importance to its having been for a long period the seat of government. In the mountains behind the town is the source of the Rio San Francisco, which flows through the city, and in the middle of the plain joins the Rio Bogotá or Rio Funza, which, running southward, and turning to the south-west, descends from the plain by the cataract of Tequendama, and thence through a ravine nearly forty miles long. At the cataract the cleft between the rocks is only about thirty-six feet wide. The water descends in one unbroken mass, 900 feet, when the river is full, but in the dry season the fall is interrupted by two projecting rocks. Further to the east is the natural bridge of Icononzo or Pandi, which is formed by two large rocks that unite the opposite sides of a deep mountain ravine. The upper rock is 300 feet above the surface of the torrent, and the lower about 240 feet. North of the city is the Campo de Gigantes, on which gigantic fossil bones are said to be found. The Campo contains also a coal-field, and towards its northern border the rich salt miles of Zipaquira. Near Bogotá is the small lake of Guatavita, 8700 feet above the sea. It was supposed that the ancient inhabitants threw immense golden treasures into this lake. An attempt was made to drain it lake, for the purpose of getting these treasures; but the attempt did not succeed. On the descent from the plain of Bogotá to the banks of the Rio Magdalena stands the town of Guaduas in a fine valley, 3768 feet above the sea: estimated population, 4000. In this valley sugar-canes and tropical fruits are cultivated.

The department of Cauca comprehends the western section of New Granada, the vale of the Rio Atrato, the region along the Pacific, the upper vale of the Rio Cauca, and the mountain-region of Los Pastos. It is divided into the provinces of Chocò, Buenaventura, Popayan, and Pasto; and is drained by the upper river Cauca, and the rivers Atrato, S. Juan, and Patia. The products are, chiefly gold and platinum near the coast of the Pacific, and in the vales of the rivers Atrato and Cauco, the cattle which pasture in the savannas of the Rio Cauca, and the cacao grown along the coasts of the Pacific. The vale of the Rio Cauca is inhabited chiefly by a white population; the other districts, by Indians, intermixed with half-breeds, and a few negroes. The canal of Raspadura connects the upper courses of the rivers Atrato and S. Juan, and is navigable for canoes during four or five months in the year. Quibdo or Citara,

in the Rio Atrato, has some trade with Cartagena: the flat-bottomed boats used in the navigation of the river, traverse the sea between the mouth of the Atrato and Cartagena, and enter the latter port by the Estero de Pasacaballos: estimated population 3000. Novita, not far from the sources of the Rio S. Juan, at the western extremity of one of the passes over the Western Andes, has 2000 inhabitants. Buenaventura, a good harbour on the Pacific, is only inhabited by a few mixed-breed families. A very difficult road leads from it over the Western Andes to the town of Cali, in the vale of the Rio Cauca. This town is well built, has some trade, and about 4000 inhabitants. In the same vale, further to the north, is Cartago, with about 3000 inhabitants. It is situated at the western extremity of the long mountain-pass of Quindiu. Popayan, the capital of the department, is in a small plain, at the southern extremity of the vale of the Cauca, not far from the snow-capped volcano of Puracé and the Rio Venagre, or Vinegar River. It is well-built, and contains about 20,000 inhabitants. Almaguer, with about 4000 inhabitants, stands in a valley in the mountain-region of Los Pastos, 7440 feet above the sea. Pasto, built at the foot of a volcano, in a plain 8577 feet above the sea, is surrounded by woods and bogs. The great road which leads from Popayan to Quito, passes through Almaguer and Pasto.

AGRICULTURE.—We have very little information as to the agriculture of this state. All that we can place reliance upon will be found hereafter.—(*See Statistics of Spanish American Republics.*)

MANUFACTURES.—The manufacturing industry of New Granada is limited to the making of coarse woollen and cotton stuffs, which are chiefly made by the lower classes for their own consumption.

TRADE.—The maritime commerce of New Granada is far from important, considering the natural resources of this state. A great part of the exportable produce of the most populous districts of the mountainous country of Boyàca, is sent by the Rio Zulia to the harbour of Maracaybo, Venezuela. The produce which is carried down the Magdalena is exported from Santa Marta and Cartagena; vessels of 100 to 120 tons ascend from Citara to Cartagena; in consequence of bad roads, goods are carried on mules and men's backs from the Upper Cauca across the Andes to Porto Buenaventura, on the Pacific.—(*See Statistics of the Spanish American Republics hereafter.*)

CHAPTER XII.

VENEZUELA.

THE Republic of Venezuela is a vast, fertile and splendid region. Magnificent rivers, luxuriant forests, high mountains, low alluvial districts and islands,

and plains, are its most remarkable features. Our information respecting this state is far more satisfactory than that which we have collected respecting most of the other states of South America.*

This state is bounded on the north by the Gulf of Paria and the Caribbean Sea, on the east by British Guayana; on the south, along a not well-defined boundary line, by Brazil; and west by New Granada. The extent of Venezuela south to north, from the boundary of Brazil, in about 1 deg. 50 min. north latitude on the Rio Negro,—to Point Chuspa, in about 10 deg. 25 min. north latitude, is about 630 miles. The greatest extent from east to west from the Caño Cayuno, at the mouth of the Orinoco, in about 60 deg. west longitude, to a point west of Lake Maracaybo, in about 73 deg. west, is estimated at about 840 miles. Its boundaries are very irregular in outline and its area is vaguely estimated at about 410,000 square miles. This country owes its name to the following circumstance. When the Spaniards discovered this country, they found a great number of Indian villages situated about the lake, built on piles, which was the reason that they gave it the name of Venezuela, after Venezia, or Venice. This name soon extended to all the province; of which Coro became the first capital. The town of Caraccas having been afterwards made the metropolis of all the countries that compose the captain-generalship, its district took the name of the Province of Venezuela; the country surrounding the lake was named the province of Maracaybo; the other three continental provinces were termed Varinas, Guayana, and Cumana. The country known by the name of New Andalusia, as well as the Island of Margarita, formed part of the government of Cumana.

The Island of Trinidad formed at one time a sixth province, or particular government, depending on that of Caraccas, before the English got possession of it in 1797. A captain-general, intendant, and an *audiencia*, or supreme tribunal of justice and finance, composed the superior government of those provinces. The provincial governors were directly subjected to the captain-general of Caraccas, in all affairs concerning the military and civil government; also to the intendant, of whom they took the title of sub-delegates, for financial measures; and the royal *audiencia* was a tribunal to which appeals were made, not only from the decisions of the provincial courts, but also to which individuals had the right of summoning such persons in office as they thought they had reason to complain of. There was a privilege of appeal from the decrees of the *audiencia*, to the supreme council of the Indies, at Madrid.

Venezuela includes the *Páramos* of Porquera, Merida, Niquitao, and Las Rosas, with the snow-clad Nevado de Mucuchies. The elevated part of these páramos rise above the limit of vegetation. The valleys, declivities, and tablelands, are very fertile, and yield, in temperate elevations, the grains and fruits of

* Our authorities are the reports of British and French consuls and decrees, reports of the Venezuelan government, the work of M. Lavaysse, Alcedo, Robinson, and various official documents.

Europe, and in the lower parts the tropical productions. Parts of Venezuela, west of the Lake of Maracaybo, are covered with wood; and extensive plains without trees extend over other districts. The highlands of Venezuela, west of the Gulf of Triste, are arid from the want of rains. The higher parts are overgrown with the prickly pear, aloes, and dwarf cedar: the valleys, in which naturally valuable timber trees grow, yield under culture, excellent coffee. The remainder of this high mountain region, is fertile, especially in the valleys. About one-half of the low or alluvial grounds of the Orinoco lie within Venezuela. The eastern portion, or the Llanos de Barcelona, or *Llanos Altos*, are scarcely ever inundated by the floods of the Orinoco, with the exception of narrow alluvial tracts along the banks, and the delta of the low district near the Gulf of Paria and the Rio Guarapiche. These low lands are either covered with wood, or occupied by swamps. The more elevated portion of these Llanos are in parts undulated; in others, extensive plains, interspersed with clumps of trees, predominate. The soil is fertile, and adapted for agricultural purposes. On the plains of Caraccas and Varinas, numerous herds of cattle are pastured. These latter plains are inundated for nearly six months in the year, especially those on the lower river Apuré. The great basin of the Rio Orinoco, is bounded by some portions of the Parime Mountains, which spread over Venezuela from the Andes of Bogotá in a northern direction, then east to the coast opposite the north-west part of Trinidad. This region is little known, with the exception of the large fertile valley of the Rio Caroni. The mountain districts are generally covered with forest. South of the upper course of the Orinoco, where it runs from east to west, on both sides of the caño of Cassiquiare and the River Guainia or Rio Negro, there are level, fertile plains, covered with trees,—but owing to the rains and the unhealthiness of the climate, said to be very thinly inhabited.

THE POPULATION consists of the whites, or descendants of Spaniards, estimated at about 250,000; the Indians, of pure blood, to 150,000; the negroes, who formerly exceeded 60,000 souls, but who have been greatly reduced by the war of independence; and mulattoes, mestizos, and Zamboes. The Indian tribes that inhabit the mountains of Venezuela, and those within the valley of Rio Carony, have been visited; and, as asserted, converted by the missionaries, and are now citizens of the republic; but there are said to be many independent tribes—the Guajiros, on the peninsula of the same name; the Cocinas, west of the Lake of Maracaybo; the Guaraons, inhabitants of the Delta of the Orinoco; and some of the tribes which wander over the Parime Mountains and the districts south of the Orinoco. The converted Indians attend to husbandry for their maintenance. M. Depons calculated the population in 1802 at 728,000; but MM. Lavaysse and Humboldt consider this calculation erroneous, and they estimate the population in 1800 at 900,000, of whom 54,000 were slaves.

According to the report of the minister of the interior for 1841, the population is stated to amount to 887,168; but he does not consider this quite exact.

The citizens of the United States would people a thoroughly new country of equal extent, and riches as Venezuela, with an equal population in less than ten years.

POLITICAL DIVISIONS.—According to the same report, and one of the secretary of finance, in 1846, the republic is divided into thirteen provinces, viz., CARACCAS, which contains about half the population of the whole state; CARABOBO, BARQUISIMETO, TRUJILLO, MERIDA, BARINAS or VARINAS, CORO MARACAYBO, BARCELONA, GAUYANA, CUMANA, APURE, and MARGARITA. Each of these provinces have governors, or chief administrators, and other functionaries, and each sends *two members to the senate*.

THE GOVERNMENT AND LAWS are lodged in a president and vice-president of the republic; a senate of twenty-six members; a chamber of representatives, at present consisting of fifty-nine members. — (*See Statistics of Venezuela hereafter.*)

DESCRIPTIVE SKETCHES.

According to M. Von Humboldt and other authorities, there are extensive steppes and deserts—but otherwise this republic is watered, abundantly inundated, and drained by rivers and streams. These appear to be well described by M. de Lavaysse. He says,

“There are nearly 370 marine leagues from the Raudal (cataract) of the Guajaribos, east of the Esmeralda (the nearest point to its sources, which are unknown) to the mouths of the Orinoco.

“The country is intersected in every direction by navigable rivers of various sizes. All those which are eastward of Cape de Paria, the Guarapiche, and the small rivers that flow into the Gulf of Paria excepted, are lost in the Orinoco. Many of its tributaries are more considerable than some distinguished rivers in Europe: the Rio Apuré runs nearly 112 leagues, and is navigable for large vessels for more than sixty leagues from its confluence with the Orinoco. In latitude 7 deg. 32 min. north, it is 4632 fathoms in width, and is not impeded by islands.*

“The Guarapiche presents a very remarkable phenomenon: this river has its source, like all those of New Andalusia, in that part of the Llanos which is denominated Mesa (a platform or plain) de Amana, Mesa de Guanipa, Mesa de Tororo, &c. The mountains that separate the maritime range of Paria from the granitic and amphibolic mountains of the Lower Orinoco, form a ridge very little above the rest of the plain; but this elevation, which is called Mesa, is sufficient to determine the rivers to run northward towards the Gulf of Paria, and to the south into the Orinoco. The Guarapiche rises in the Mesa de Amana, to the south-west of the village of Mathurin: it receives near St. Antonio the Rio Co-

* The leagues of Humboldt and others are the common French league, of scarcely two and a half miles English—not the geographical league of twenty to a degree.

lorado, then the Rio Punceres, and at last the large river Arco, which is called Rio de San Bonifacio, near its source. The Governor Emparan had formed some very useful projects for colonial establishments on the fertile banks of the Arco and Guarapiche. The place where the Arco unites with the Guarapiche, at five leagues from its mouth, is called the Horquetta, a name given by the Spaniards to all junctions of rivers: at that point the Guarapiche has a depth of from forty to fifty fathoms. Previous to 1766, large vessels could have sailed up the Guarapiche to Mathurin: an earthquake has since raised its bed, and now the navigation of the Rio Arco is preferable. The latter is still sixteen fathoms deep as far as Port San Juan, at twenty-five leagues from the sea. I can venture to assert that there is no communication between the Guarapiche and Orinoco: I have never heard it mentioned in all the time I resided in that country, and in which I travelled through it in various directions."

In the map of a work, otherwise estimable (*Travels of M. Depons*), there is laid down a pretended natural canal, called Morichal, forming a communication between those two rivers above Old Cayenne. M. de Humboldt, who navigated that river, had no knowledge of such communication. The Guarapiche, notwithstanding its depth, and the great body of water it carries to the sea, is only, from its sources in the mountains to its mouth, thirty-three marine leagues in length.

Maracaybo, and the other gulfs, or inlets from the sea, and the Lake Tacarigua, are all remarkable.

The Lake Tacarigua, to which the Spaniards have given the name of Valencia, is situated about fifty leagues west from Caraccas. "It is elevated 1200 feet above the level of the sea, and has almost the shape of an oblong square: its length is thirteen leagues from east to west, and it is two leagues broad in almost its whole extent." "The contrast of the desert and barren mountains of Guigue, with the hills and valleys opposite, ornamented with the most beautiful tropical products, and even the fields of corn and fruit trees of Europe, and the vicinity of the little town of Valencia, agreeably reminds an European of the Lake of Geneva and Vevay. The mountains of Caraccas, it is true, have not the grand appearance of the Alps; but then how much superior the rich, varied, and majestic vegetation which ornaments the borders of the Tacarigua is to the most beautiful natural productions of Europe! I was there in company with a Dane (Mr. West), a man of talents. Whilst we were absorbed in the contemplation of that delightful scene, the native of the north suddenly exclaimed: 'It is here that we should fix our residence for the remainder of our lives: I shall return to Santa Cruz, there collect my property, and come to these charming shores, which shall also be my tomb.'"—*Lavaysse*.

Several small rivers and streams flow into this lake, which has no outlet: by evaporation more water is exhaled from the lake than is carried to it, from which M. de Humboldt explains the formation of the small islands that have been formed in

the lake: at first they were only sand-banks, which by degrees became covered with vegetables. Another cause, similar to that which is observed at Trinidad, has contributed to the formation of these islands; the draining and cultivation of the valleys of the adjacent *Aragoa*. "There is a prodigious difference between the quantity of slime carried off by the rains and torrents in a cultivated, or a savage country: it is known that in the latter the quantity of earth washed away is much less than in the former: if the mountains and valleys which surround the Lake Tacarigua, had not lost their ancient trees and thick turf, perhaps it would have required a thousand years to have formed these small islands in its bed. From time to time new ones are seen to arise. The inhabitants of the neighbourhood have given to them a name that justly characterises them: Las Aparecidas, the new-born islands. A great number of small crocodiles are seen in this lake, which never attack the persons who go there to bathe."—*Ibid*.

The shape of the Lake, or rather Gulf, of Maracaybo, is an oval sea, of about 100 miles in length, by seventy in breadth: this inlet is situated between the lowest part of the mountains of Santa Martha, and near the place where the chain begins, which is detached from the Andes de Bogotà: "it communicates with a gulf of half its size, by a passage of about two leagues broad and eight long: thus this lake forms a little Mediterranean: it receives the tribute of more than twenty rivers, and a great number of rivulets that run down the two ridges of the mountains, between which it is situated. The most considerable are the Subio and the Matacau; for the Souba and the Cuervos, though wide at their mouths, are only creeks fed by torrents, into which the waters of the lake recoil during winter."

The Souba is nearly eight leagues in length, and the Cuervos forms a curve of about fifteen leagues: both of those creeks which branch from Lake Maracaybo are navigable. It is between them and the mountains, that the Guahiros are settled; warlike Indians who have never been subjected by the Spaniards. They extend to the other side of the mountains, along the Rio de la Hache to the borders of the sea.

Though the Lake of Maracaybo is connected, by the flowing and ebbing tide, with the sea, its waters are sweet and fit for drinking; but when the wind blows inwards, with violence, the sea water rushes into the lake, and its water becomes brackish until the wind changes. This lake is not subject to tempests; yet when the north wind is strong, it produces a short and broken swell that sometimes does considerable injury to the smaller craft.

The tide rises higher in this lake than on the adjacent coasts, where it is scarcely perceptible. Mr. Lavaysse says, "it is the same in the Gulf of Paria, and in that of Cariaco, because the tide and wind oppose the water there, which continually runs out. On the north-west shore of the Lake Maracaybo is an extensive mine of asphaltum, of the same nature as that in Trinidad."

CARACCAS, the capital of the republic, and the seat of the legislature and government, is situated in the fruitful valley of Arragon, connected with the vale of the river Tuy, 2822 feet above the sea-level. It is separated from its port La Guayra, which is about sixteen miles distant, by a mountain ridge, the highest part of which on the road is 5160 feet. In this ridge the Silla de Caraccas rises to a summit 8631 feet high. The town is regularly built on a declivity, and has wide streets, which cross at right angles. The climate is healthy. The cathedral was much damaged in 1826 by an earthquake; and the city suffered greatly from one also in 1812. Caraccas has a university, founded in 1778; about 50,000 inhabitants, about the same number as in 1810, when the province contained 496,772 inhabitants, and carries on a considerable trade in the products of the adjacent fertile valleys. It has an archbishop.

It was the residence of the captain-general, of the chief of the inquisition, and audiencia, and the ruler of Spain, situated on an unequal surface, the consequent absence of regularity is gained in picturesque effect: many of the houses have terraced roofs, others are covered with tiles; several have only one story, the ground floor; the rest have but one more: they are built either of brick or of earth, and covered with stucco, the architecture is sufficiently solid, handsome, and well adapted to the climate. Many have gardens in their rear. The town, in consequence, is, in extent, equal to an European one, with more than 100,000 inhabitants. Four beautiful streams traverse it, and contribute to its coolness and cleanliness, and give it an animation not experienced in towns deprived of running water. M. Lavaysse says,

"As in some towns of the Alps and Pyrenees, each householder in Caraccas has the invaluable advantage of having in his house a pipe of running and limpid water, which does not prevent all the squares, and almost all the streets from having public fountains. In general there is much luxury and gilding in the decorations of the houses of wealthy persons, and among all, more cleanliness and comfort than in Spain. This town does not possess any public edifice remarkable for its beauty and size, with the exception of the church of Alta Gracia, built at the expense of the people of colour in Caraccas and its vicinity.

"It is divided into five parishes; that of the Cathedral, Alta Gracia, Saint Paolo, Saint Rosalia, and La Candelaria. Three other churches belong to confraternities: Saint Maurice, the Divina Pastora, and the Trinidad. They are solidly built, and richly ornamented in the interior. The cathedral is 250 feet long by seventy-five broad, and its walls are thirty-six feet high; four ranges of stone columns, each containing six, support the roof; the only public clock in the town, was in the steeple of this church.

"This town has five convents, of which three are for men, the Franciscans, Dominicans, and Brothers of the Order of Mercy. The church of the Dominicans has a very curious historical picture: it represents the Virgin Mary suckling a grey-bearded Saint Dominic. The following is the account of this miracle, as recounted by the sexton to those who visit the church: St. Dominic having had a violent pain in his breast, and his physician having ordered him woman's milk, the Virgin suddenly descended from heaven, and presented her breast to the saint, who, as it may be supposed, was cured in an instant."

Porto Cavello or Cabello, is situated at a league to the west of Borburata. The latter was at one time the principal port of the colony; but it has been only

a village since the maritime trade was chiefly directed to La Guayra. It is an unhealthy place, yet one which any other government would have easily rendered healthy. There is, however, considerable trade carried on there, and although it was the principal port in the government of Caraccas for the Spanish navy, yet in no other part was there so much contraband trade carried on.

Lavaysse says—

“More than half the produce of the province of Caraccas was carried there, and sold to the smugglers of Curaçoa and Jamaica, who paid for all the produce in British and Dutch merchandise, besides selling annually to the amount of 1,300,000 to 1,400,000 dollars of those merchandises, for which they were paid in specie.”

Porto Cavello is twenty-four leagues from La Guayra, and in 10 deg. 28 min. north latitude, and 69 deg. 10 min. west longitude.

VALENCIA.—This town was founded in 1555 ; it is situated at half a league from the splendid Lake of Tacarigua. Lavaysse remarks,

“That the indigenous names of the mountains, lakes, rivers, &c., are much more harmonious than those which the Europeans have wished to substitute for them : a few of those words, as the aboriginal inhabitants pronounce them, will prove the assertion ; Tacarigoa, Maracaybo, Nik-karagoa, Ibirinocco,* Naiagara, Ontario, Amana, &c.”

The population of Valencia was 6500 persons in 1801 ; it increased to more than 10,000 in 1810 ; it is now stated about the latter number.

M. Lavaysse says,—

“The inhabitants are nearly all Creoles, the offspring of ancient Biscayan and Canary families. There is great industry and comfort in this town. It is as large as an European town of 24,000 to 25,000 souls, because the greater part of the houses have only a ground floor, and many of them have gardens. Fifty years ago (now seventy), its inhabitants passed for the most indolent in the country : they all pretended to descend from the ancient conquerors, and could not conceive how it was possible for them to exercise any other function than the military profession, or cultivate the land, without degrading themselves. Thus they lived in the most abject misery, on a singularly fertile soil. Their ideas have since completely changed ; they have applied themselves to agriculture and commerce, and the grounds in the neighbourhood are now well cultivated.”

Valencia concentrates an inland trade from and with Caraccas and Porto Cavello.

MARACAY is situated at the eastern extremity of Lake Tacarigua.

“It was inhabited,” says Lavaysse, “by a race of men, whose minds were never deranged by the frivolous and noxious pride of birth : almost all the inhabitants of the town, and of the neighbouring country are of Biscayan origin, and therefore, industry, comfort, cleanliness, and good morals are to be found generally throughout this district.”

The grounds around Maracay, are under, principally, plantations of cotton, indigo, coffee, and maize, on the heights the vegetables of the temperate climes of Europe, and wheat, will thrive. Estimated population about 10,000 inhabitants.

TULMARO is situated in one of the valleys which communicates with the val-

* Of which the Spaniards have made Orinoco, Ibirinocco was also the name of the mountains where they supposed the sources of this river were.

ley of Aragoa; it is two leagues from Maracay. This was the residence of the administrators of the tobacco contract. This town is very well built; 8000 inhabitants were calculated as its population in 1807; and about the same number now inhabit it, the plantations of tobacco were from the first cultivated on account of the government.

VITTORIA is situated between Caraccas and Tulmaro, on the side of a village of Caraccas Indians, whom the Spanish missionaries had converted to Christianity. About 125 years ago a great many Spaniards, who established themselves among them either by lawful or clandestine connexions with the native women, became the parents of a numerous and mongrel population.

In 1807, the population in the valleys of Arragon was distributed on 237 plantations, and nearly 2000 houses in towns or villages: it consisted of 24,000 whites, 18,000 mixed blood, 6500 Indians, and 4000 slaves. Total 52,500 persons.

CORO.—The convenient situation of Coro for trading with the neighbouring islands, and particularly with Porto Rico and St. Domingo, caused its site to be chosen for the first settlement which the Spaniards founded on this part of terra firma. The tribe of Indians that inhabited it were called Coriana.

The environs are barren, but at three leagues from the town are hills, valleys, and plains of some fertility. The town is situated on the Isthmus of Paragoana, whose inhabitants lead a pastoral life. In 1822, 10,000 persons of all colours, among whom there were scarcely 200 slaves, form the population of the town. They still hold a considerable trade with Curaçoa in cattle, hides, and indigo, and even in cochineal, which last article comes from the district of Carora.

CARORO is situated inland about fifteen miles east of Maracaybo Lake; called by an Indian name Carora, had with its district in 1822, nearly 10,000 inhabitants; we are ignorant of its present number. Formerly the inhabitants were occupied chiefly collecting a kind of wild cochineal, as fine as the *Misteca*. The soil of the district is arid, but herds of oxen, horses, asses, mules, sheep, and goats, pasture on it, and breed cattle chiefly for tanning the hides. The inhabitants were rather noted as shoemakers, saddlers, weavers, and ropemakers. They make hammocks and packthread of the fibres of the agave foetida.

BARQUISIMETO, which gives its name to the province, is situated on a plain. Though in 9 deg. 45 min. of north latitude, it enjoys a very mild climate, and wheat grows in the vicinity. All the tropical productions flourish in the surrounding valleys. The town is well built, and had, with its district, in 1825, a population of about 15,000 inhabitants. "In the parish church," says Lavaysse, "there is a crucifix which has worked a great many miracles, and is at the same time an object of devotion with the people, and an abundant source of revenue to the clergy of the church. In the same town is a convent of rich Franciscan friars, who are esteemed great lovers of good cheer, also an hospital, where the

poor are badly lodged and scantily fed." This town is ninety leagues west from Caraccas, and 100 north of Santa Fe de Bogota.

SAN FELIPE.—Was settled by a great number of Canary Islanders and natives of the neighbouring districts, who were attracted by the fertility of its soil. The inhabitants grow cocoa, coffee, maize, rice, and a little cotton. This district is watered by the rivers Jarani and Arva, and by numerous rivulets. The copper-mines of Arva are in the neighbourhood. Population about 7000.

TOCUYO is built in an elevated valley; its climate is even cold, from the month of November to April, whilst the wind blows from the north. Its district is adapted to all kinds of agriculture, and a great quantity of wheat has been grown around. The wool of the Tocuyo sheep has had a high reputation for blankets and kerseymeres.

GUARARE is situated in a magnificent plain on the banks of a river of the same name, and extends towards the Portuguese River, which is navigable, and falls into the Apure. It was founded in 1593.

The town of San Juan Bautista del Poa, 125 miles south-west of Caraccas, is the centre of a Portuguese district.

SAN CALES was settled by emigrants from the Canary Islands. Banio is near it. *Calaboza*, formerly a village of Indians, has been transformed into a town by the Biscay Company.

In the valley, the towns of Aragua and San Matheo contain each from 6000 to 8000 inhabitants; Araure, 11,000. These towns owe their foundations to the fertility of the districts, and to the pastures of the continuous cattle plains.

"In those times of conquest and anarchy, the Spanish generals, who fought at 2000 leagues distance from their sovereign, acknowledged no other law than that suggested by their strength and caprice. Christopher Cobos, enraged at the scanty force Roxas had put under his command, and at his private intrigues to counteract his success, did homage for his conquest to Rodrigo Nunes Lobo, governor of Cumana, and the metropolitan government approved of the union of the country of the Cumanagotos (the district of Barcelona) with the government of Cumana. From thence it arises, that the governors of Cumana style themselves also governors of Barcelona."—*Lavaysse*.

CUMANA.—According to M. Depons, the population of the town of Cumana was 24,000 persons in 1802. In 1807, according to M. Lavaysse, it amounted to 28,000 and upwards; and at the end of 1810, it had increased to 30,000 inhabitants, almost all industrious and laborious.

Cumana, when visited by M. Lavaysse, had two parish churches and two convents for men; one belonging to the Dominicans, and the other to the Franciscans. It had no magnificent edifice. It rains more rarely at Cumana than at Caraccas.

Bull-feasts, cock-fighting, and rope-dancing, are the amusements most fre-

quented by the inhabitants of this town and the rest of the province. As there was no town clock when M. de Humboldt was there in 1800, he constructed a very fine sun-dial. The Cumanese never fails to say to a stranger who passes it, "We owe this sun-dial to the learned (*sabio*) Baron de Humboldt." The word *sabio*, in the mouth of a Creole of the Spanish colonies, signifies both wise and learned.

The River Manzanares runs through the middle of this town; there is a bridge across it: the water in this river has only sufficient depth for very small vessels. Large ships anchor at the *Placer*, a sand-bank in the middle of the port, which is well sheltered.

Cumana is situated in 10 deg. 37 min. north latitude, and 64 deg. 10 min. west longitude: its climate is very hot, the elevation of the town above the sea level being only fifty-three feet. Fahrenheit's thermometer usually rises to 90 deg., and sometimes even to 95 deg., from the month of June until the end of October. In that season it seldom descends to 80 deg. during the night, but the sea breeze tempers the heat. It is said, however, that the town is healthy. From the commencement of November to the end of March, the heats are not so great; the thermometer is then between 82 deg. and 84 deg. in the day-time, and generally falls to 77 deg. and even 75 deg. during the night. There is scarcely ever any rain in the plain in which Cumana is situated, though it rains frequently in the adjacent mountains.

It is built at the foot of a volcanic mountain, and subject to earthquakes. To the north-east is the Gulf or inlet of Cariaco. Opposite to Cumana, is the Point of Araya, on which there was once a fort. This gulf is about thirty miles long from east to west, and from eight to ten miles in breadth. The largest ships might ride in it with safety from all weathers.

The Gulf of Cariaco has in all parts good anchorage. On each side the land presents two amphitheatres ornamented with the most beautiful and varied vegetation. At the bottom of the gulf, to the east, is the fine plain of Cariaco, watered by the navigable river of the same name. At a mile and a half from its mouth is the town, or rather the large village of Cariaco, which the Spaniards called San Felipe de Austria.

The population of this place was about 7000 persons in 1807. Until the beginning of the present century, cotton and cocoa-trees only were cultivated, but coffee was afterwards grown, with sugar plantations, and a distillery for rum established. In 1807, the governor, Manuel de Cagigal, endeavoured to prevent the distillation of rum, under the false pretence that it would injure the trade in brandies with Spain; but the true reason was, that the rum trade, one of the English smuggling branches, brought large profits to his excellency.

Innumerable flocks of sea-fowls frequent the Gulf of Cariaco, chiefly on the banks of mud situated on the sides of the entrance to the river.

According to Lavaysse,—

“ These birds issue by thousands from the *mangrove trees*, where they pass the night, and disperse over the surface of the water to seek their food: when their hunger is satisfied, some repose on the mud and sand-banks; some swim on the water merely for diversion, while others cover the branches of all the neighbouring trees. I have seen a bank of sand above three hundred yards in length, and the little banks or islands near it entirely covered with these aquatic birds. Those I recognised were flamingoes of all ages and colours, pelicans, herons, boobies, five or six kinds of ducks, of which one is larger than that of India, several kinds of water-hens, a bird as white and as large as a swan, but which has a long beak, red and pointed, longer and more delicate legs, and feet formed like those of a swan: it swims like that bird, but flies much better. I also saw in the same spot, many other birds which I am sure have never been described by any naturalist.”

M. Lavaysse describes the manner of catching aquatic birds as singular. The inhabitants of the shores of these lakes and gulfs, scatter calabashes over the water, in order that the birds, by being accustomed to see them, may not be alarmed at the sight. When the Indians wish to catch wild fowl, they go into the water, each with his head covered with a calabash, in which they make two holes to see through. They swim towards the birds, throwing a handful of maize on the water from time to time, the grains soon scatter on the surface. The wild fowl approach to feed on the maize, and the swimmer seizes them by the feet, pulls them under water, and wrings their necks before they can make the least noise to alarm the flocks.

The port of *Carupano* is defended by a battery situated on an eminence. It is described as a healthy place, situated in the opening of two charming valleys, through which flowed two fine rivers.

Lavaysse says in his time,—

“ The inhabitants divide their time in the occupations of agriculture, some trading concerns, and dancing. It is completely a dancing town. I have seen very fine youths at the balls of Carupano, and many young women, who would be remarkable for their beauty even in our European cities; but they are beauties entirely strangers to the arts of our coquettes; beauties such as nature has made them, and who know no laws than what that unsophisticated deity has given them.”

Population of the district about 7000.

Between Carupano and the Punta de Piedra, the fertile valley of Rio Caribe is crossed, watered by numerous rivulets: it is the *Tempe and Campagna of this country*.

The town and valley of Rio Caribe have an estimated population of from 4000 to 5000 persons.

Punta de Piedra, which in 1797, was only a hamlet of fishermen, it became afterwards the principal place in the district of Paria, and the residence of a lieutenant-governor. It is situated in a district of prodigious fertility, and near the mouths of the Guarapiche, Orinoco, and the ports of Spain in Trinidad.

The town is situated in a magnificent plain, and on a platform which commands the sea; from whence there is a view of the port of Spain, all the western part of

the island of Trinidad, the Gulf of Paria, and of all the vessels that enter or go out of it.

At the extremity of this plain opens the beautiful and fertile valley of Yaguaraparo, in which are plantations of coffee and cocoa; the fertility of its soil, and its climate particularly appropriated to the latter plant, at one time made the fortunes of most of those established there.*

The valleys, and above all the banks of the rivers of this part of the province of Cumana, abound in logwood and Brazil wood.

CUMANACOA is the chief town of one of the most fertile districts of the province of Cumana. It is situated in a valley of the same name, about forty-five miles inland, to the south-east of Cumana: the air is healthy and tolerably cool. The fruits cultivated there are reputed the best in the province. The population of the town and adjacent country is about five thousand souls. Until sixty years ago, the neighbouring country was inhabited by unconquered Indians, who made frequent incursions against the Spaniards of this quarter, the missionaries have pacified and united them in missions.

Humboldt, who remained at Cumanacoa to make astronomical observations, determined its latitude at 10 deg. 16 min. north, and its longitude at 64 deg. 15 min. west.†

The province of New Barcelona is bounded on the east by the province of Caraccas, on the west by that of Cumana, and on the south by the Orinoco, which separates it from Guayana. It is thinly inhabited and ill-cultivated, but less mountainous than Caraccas and Cumana. On its vast meadows numerous herds of oxen, horses, asses, and mules, feed. The port of Barcelona exported, during the peace of Amiens, in one year, 132,000 oxen, 2100 horses, 84,000 mules, 800

* A Catalan sailor settled here in 1790, when the valley was almost a desert; he began alone to fell the woods and plant cocoa trees: in 1797 this man had twenty negroes on his plantation; in 1804 he had thirty slaves, and with this small assistance he gathered more than one hundred thousand pounds weight of cocoa. He died in 1804, intestate, it is said, and the Spanish government took possession of his property.

† At twenty leagues inland, on entering the range of mountains, near that of Turimiquiri, is the famous grotto of Guacharo, in which are millions of a new species of *Caprimulgus*, that fill the cavern with their plaintive and dismal cries. The fat is extracted as an article of commerce. In every country the same causes have produced similar effects on the imagination of our species. The grotto of Guacharo is, in the opinion of the Indians, a place of trial and expiation; souls when separated from bodies go to this cavern; those of men who die without reproach do not remain in it, and immediately ascend to reside with the great Manitou in the dwellings of the blessed; those of the wicked are retained there eternally; and such men as have committed but slight faults of a venial nature, are kept there for a longer or shorter period, according to the crime.

"Immediately after the death of their parents and friends, the Indians go to the entrance of this cavern to listen to their groans. If they think they hear their voices, they also lament, and address a prayer to the great spirit Manitou, and another to the devil Muboya; after which they drown their grief with intoxicating beverages. But if they do not hear the wished-for voices, they express their joy by dances and festivals. In all this there is but one circumstance that creates surprise, it is that the Indian priests have not availed themselves of such credulity to augment their revenues. Many Indians, though otherwise converted to Christianity, have not ceased to believe in Guacharo: and to descend into Guacharo is among them synonymous with dying."—*Lavaysse*.

asses, 180,000 quintals of tassajo, or smoked beef, 36,000 ox hides, 4500 horse hides, and 6000 deer skins.—(See statistics of Venezuela hereafter.)

BARCELONA is badly built ; the houses are of mud, and in general said to be very meanly furnished. The streets are filthy and miry when there is rain, and in dry weather, with even the least wind, the dust is enough to blind one. Alcedo says that the climate of Barcelona is more unhealthy than that of Cumana. It is exactly the reverse : the climate of Cumana is very healthy, though hot, because it is dry, and that of Barcelona unhealthy from the opposite causes. This town had in 1807, a population of 15,000 persons ; at present the number is not estimated as having increased.

Barcelona is in 10 deg. 6 min. north latitude, 67 deg. 4 min. west longitude, and thirty miles from Cumana in a direct line : but the windings which it is necessary to make to avoid bad roads, make it a journey of twenty hours. It is reckoned ten marine leagues by sea from the port of Barcelona to that of Cumana ; from the former to the latter port there are numerous islets, frequented by fishermen, but they afford no shelter for large vessels.

CONCEPTION DEL PAO is built in a plain situated behind the range of Bergantin ; the climate is said to be wholesome, although very hot and subject to heavy rains. It owes this advantage to its elevated situation, from which waters run into the Orinoco and Guarapiche. It is little cultivated, but its pastures feed numerous herds that are exported by the above rivers to Trinidad and Tobago.

There are few countries naturally more varied, fertile, or better watered than the different districts of Cumana. Its mountains on the coast form a magnificent barrier to the sea. On those mountains and hills, gigantic and valuable trees, shrubs, aromatic plants, and flowers grow luxuriantly.

SPANISH GUAYANA, now included within the republic of Venezuela, has for its boundaries, Brazil at San José de Marasitanos to the south, New Granada and the province of Varinas to the west, those of Cumana, Barcelona, and Caraccas on the north, and the British, French, and Dutch Guayana to the east.

The language of the *Marsitan Indians* is as generally disseminated towards the Equator, as the Caribbean tongue is from the banks of the Essequibo to those of the Magdalena.

According to the Spanish historians, Juan Cornepo was the first European who sailed up the Orinoco, in 1531. Sir Walter Raleigh and Robert Dudley visited it afterwards. The chimera of El Dorado also attracted a great number of Spanish adventurers to it.

In 1586, Don Antonio Berreo founded a town, to which he gave the name of *San Tomé*, on the right bank of the Orinoco ; but the Indians did not permit him to establish himself long in it. It having been pillaged by the English, Dutch, and French, another town was in 1764 built further from the sea, about 230 miles

from the mouths of the Orinoco. It is known by the name of San Tome de Angostura, but its name in 1846 has been changed to Bolivar.

During the Spanish domination, it was the residence of a governor depending on the captain-general of Caraccas in political and military affairs, and on the intendant of Caraccas for those of finance. It was also the residence of a bishop and chapter. The chapter and its bishop were the poorest ecclesiastics in America.

The other towns or villages in Spanish Guayana are Barceloneta, Santa Rosa de Maruente, and Caicara, which is about 250 leagues westward of San Tomé and San Antonio, forty leagues distant from it. There were also missions dispersed over this province.

The town of *San Tomé de Angostura* had, in 1807, a population of about 8500 persons, among whom were 300 black slaves. This town is tolerably well built but horridly paved. Though situated in 8 deg. 8 min. north latitude, and not much elevated, it is said to be healthy.

It would be very remarkable, if the climate had been inhabited by any other than European race, that Spanish Guayana, which is by far the most fertile region of Venezuela, should be the worst cultivated, the poorest, and least peopled.

M. Lavaysse says,—

“I do not believe there exists a country more wholesome, better watered, more fertile and agreeable to inhabit than that which is situated on one side between the Essequibo and the Caroni, and on the other, between the Caroni and the Orinoco: this tract is more than forty-five leagues from north to south, and seventy leagues from east to west; yet in its whole extent, it does not form a sixth part of Spanish Guayana!

“If the Jesuits had not founded formerly the missions which are now superintended by the Capuchins, it would still have been covered with forests inhabited by savages and beasts of prey. The number of inhabitants is about 30,000 souls, of whom 15,000 are united in missions. The others, such as the Arroaks and Guaraouns, are independent, and have not embraced Christianity. It is estimated that there are now 8000 whites dispersed in the villages and huts in the remainder of the province, about 6000 Mestizos or free people of colour, and about 3000 slaves.”

The inconvenient position of Angostura is considered by Lavaysse as one of the principal causes of the languishing state of agriculture and trade in this province:—

“It is necessary that there should be a commercial town nearer to the sea; for the swiftest sailing vessels require fifteen days to sail from the mouths of the river to Angostura. This port becomes worse every day from the sand-banks: there are rocks in that part of the port most convenient for landing merchandise, but these might be easily blown up. The town of Barceloneta, peopled with industrious Catalans, is well placed for becoming a situation of considerable trade.”

Steamboats will, however, obviate all the difficulties and obstacles of the Orinoco. Spanish Guayana is a country almost wild; the only object of cultivation being a little sugar, cotton, indigo, arnotto, and excellent tobacco.

The oxen, horses, and asses, which were originally transported from Europe, increased greatly in this luxuriant region, so that herds of them became wild in the savannahs and forests.

The wild horses live in societies, generally of 500 or 600, and even a 1000 or more: they breed on immense savannas, where it is dangerous to disturb or attempt to catch them. It is related of these wild horses by Lavaysse and others,—

“In the dry season they are sometimes obliged to go two or three leagues, and even more, to find water. They set out in regular ranks of four abreast, and thus form a procession to the extent of a quarter of a league. There are always five or six scouts, who precede the troop by about fifty paces. If they perceive a man or jaguar (the American tiger), they neigh, and the troop stops. If avoided, they continue their march; but if an attempt be made to pass by their squadron, they leap on the imprudent traveller and crush him under their feet. The best way is always to avoid them, and let them continue their route. They have also a chief, who marches between the scouts and the squadron, and five or six other horses march on each side of the band; a kind of adjutants, whose duty consists of hindering any individual from quitting the ranks. If any one attempts to straggle either from hunger or fatigue, he is bitten till he resumes his place, and the culprit obeys with his head hanging down. Three or four chiefs march at the rear guard, at five or six paces from the troop. What I have just stated is a fact, which I witnessed twice on the banks of the Guarapiche, where I encamped five days for the express purpose of seeing those organised troops pass. I have met on the shores of the Orinoco, herds of fifty to a hundred wild oxen: a chief always marched at the head and another at the rear of these.

“The people of the country have assured me, that the wild asses, when they travel, observe the same discipline as the horses; but the mules, though they also live in troops, are continually fighting with each other, and it has not been observed that they have any chief. They, however, unite at the appearance of a common enemy, and display still more trick and address than the horses in avoiding the snares which are laid for catching them, and also for escaping when taken.”—*Lavaysse*, p. 134.

PROVINCE OF VARINAS.—The town of Varinas had, in 1787, a population of 12,000 inhabitants. According to M. de Humboldt, it is situated in 7 deg. 33 min. of latitude, and 70 deg. 22 min. west longitude, from the meridian of Greenwich. This province has some other towns; San Jayme, containing 7000 souls; San Fernando d' Apure, 6000 souls. M. de Humboldt places San Fernando in 7 deg. 53 min. north latitude, and 70 deg. 20 min. west longitude. Pedraza is situated at the foot of the mountains which separate the plains of Varinas from the province of Maracaybo: this little town had, in 1807, a population of 3000 souls.

Some sugar, coffee, indigo, tobacco, cotton, calico, &c., are cultivated. Cattle and beef are exported.

This province of Varinas is watered by numerous streams, and several navigable rivers which flow into the great Portuguese river, and the Apure, the principal tributary of the Orinoco.

The inhabitants chiefly lead a pastoral life. There are but few aborigines in this province. A few civilised Indians live with the whites and Mestizoes on the pastures. There were nearly 6000 slaves among the population of this province in 1825.

PROVINCE OF MARACAYBO.—The town of Maracaybo, or New Zamora, was, until the beginning of the seventeenth century, the capital of Venezuela.

New Zamora was founded in 1571, by Alonzo Pacheco, four years after the foundation of Caraccas.

Maracaybo is tolerably well built of stone: its climate is considered healthy though hot. In 1807, its estimated population was 25,000 inhabitants, of whom 5000 were slaves.

The Jesuits had a college there, and it was then called the literary town of America; but with that order, their establishments for public instruction also fell.

Next to Maracaybo, the most important town in this province is Merida, founded in 1558 by Juan Rodrigues Suare: this town is the seat of a bishop and chapter; it has also a seminary for young ecclesiastics, and a college. This town is situated between three rivers, which form an island of its district, and discharge themselves into the Lake of Maracaybo. The position of this town near the mountains, renders its temperature very variable.

TRUXILLO was founded in 1520, by Diego de Parades, and once considered the handsomest town in this part of America; it was pillaged and burnt by the pirate Grammont in 1678, who landed eighty leagues from it. All the inhabitants who could not escape, were cut to pieces. There were 12,000 inhabitants in it in 1807. This town is situated among the mountains, and enjoys a very mild temperature. In the valleys of its district are cultivated all tropical productions; and on the hills and elevated situations, wheat, vines, and other articles produced in the temperate regions of Europe. Gibraltar is another little town placed near the lake, and on the shore opposite to the town of Maracaybo: it contains 3000 inhabitants. The population of the province of Maracaybo was, in 1807, 174,000 persons.

ISLAND OF MARGARITA.—The soil of Margarita is arid and unproductive. The pearl fishery attracted numerous adventurers. The Dutch, jealous of its prosperity, burnt and destroyed Pompatar, the principal town, in 1662.

The colony of Margarita was for a long time only a district of the province of Cumana, and governed by a chief who had the title of lieutenant-governor, under the orders of the Governor of Cumana. About sixty years ago the Spanish government erected it into a separate government.

The Island of Margarita has three ports, the most important is that of Pompatar, situated on the south-east coast. It is a capacious and safe basin. There has long been carried on a considerable contraband trade with the English and French colonies, &c., and also with Cumana.

Pueblo de la Mar is an open roadstead, of little trade, situated at a league-and-a-half westward of Pompatar. Pueblo del Norte is a village situated in the northern part of the island: a coral reef renders the entrance to it difficult. Near it is a village inhabited by fishermen.

The valleys of San Juan, Santa Margarita, and Los Robles, have each a village which bears their name. Assoncion is the capital of the island, and the residence of the governor.

The agriculture of the island scarcely suffices for the maintenance of its inhabitants. Maize, cassava, and bananas are grown: the bananas are excellent, but small. The inhabitants cultivate in small proportions, and for their own consumption only, all the productions of the Antilles, the sugar-cane, coffee, and cocoa trees, &c. : they rear goats and sheep.

The climate of Margarita is healthy; the island has only three rivulets, which, however, are sufficiently large to turn mills; their waters are limpid, but the inhabitants prefer drinking water from ponds, though it is always turbid, but said to be more wholesome than rain water.

The fisheries form the principal object at Margarita.

The inhabitants of the towns and villages of Venezuela are generally farmers, who cultivate their lands, or keep flocks and herds in the surrounding countries. Priests, physicians, *escrivanos* (lawyers, who are, at the same time, barristers, notaries, attorneys, and even bailiffs), and needy shopkeepers form the remainder of the population. Mountains, forests and savannahs occupy the intervals that separate the district of a town or village from the neighbouring towns or villages, which are generally twenty to thirty miles or more from each other. Occasionally, usually at about twenty-five miles distance, missions or villages of half civilised Indians.

This republic possesses all the resources of prosperity; and we must admit that its people and its government have acted, since their independence of Spain, with more wisdom than any of the Spanish republics, unless Chili form an exception; but the vast natural resources of a region comprising an area of more than three times that of the United Kingdom, and with less than 1,000,000 inhabitants, requires a great population, intelligence, and wisdom, to realise the prosperity and power of which Venezuela is eminently capable.—(See Statistics of Venezuela hereafter.)

CHAPTER XIII.

THE RIVER ORINOCO AND ITS TRIBUTARIES.

ALCEDO denominates this magnificent river the most abundant river of the Nuevo Reyno de Granada, and South America, one of the four largest rivers on the continent. It rises in the Sierras Nevadas, to the north of the Lake Parime, in the province of Guayana, according to the discovery made by order of the court by Admiral Don Joseph de Iturriaga, and by the informations received from the Caribes Indians, proving erroneous the origin given to it by the Father Joseph Gumilla, the Jesuit, in his book entitled "*Orinoco Illustrado*," as also the origin

given it by the ex-Jesuit, Coleti, namely, in the province of Mocoa, in latitude 1 deg. 21 min. north. Without being able to prove fully where the source of this river arises, nor even which of the great upper branches constitutes its chief stream, the more recent accounts say its source is the small lake called Ipava, in the Sierra Ibermoqueso, in the province of Guayana.

The Orinoco, taking the stream considered its principal branch, is estimated to flow over a course of about 1600 miles, receiving a multitude of tributaries, which swell its waters into vast magnitude.

"The Orinoco," says Alcedo, "bears the name of Iscaute until it passes through the country of the Tames Indians, where it receives by the west side the rivers Papamene and Plasencia, and acquires then the name of that district, which it changes at passing through the settlement of San Juan de Yeima into that of Guayare, and then to that of Barragan, just below where it is entered by the abundant stream of the Meta, and before it is joined by the Cazanare, of equal size. It receives on the north side the rivers Pau, Guaricu, Apuré, Cabiari, Sinaruco, Guabiaris, Irricha, Sna Carlos, and others; and by the south those of Benituari, Amariguaca, Cuchivero, Caura, Aroi, Caroni, Aquiri, Piedras, Vermejo, or Colorado, and others of less note; and being rendered thus formidable with all the above, it at last becomes the Orinoco.

"Its shores and islands are inhabited by many barbarous nations of Indians, some of whom have been reduced to the Catholic faith by the Jesuits, who had founded some flourishing missions, until the year 1767; when, through their expulsion from the Spanish dominions, these Indians passed to the charge of the Capuchin fathers."

According to the same authority, the Orinoco is navigable for more than 200 leagues, about 500 miles for vessels of any size, and for canoes and small craft from its mouth as far as Tunja or San Juan de los Llanos."

We doubt the correctness of this assertion. This river in several parts swarms with alligators. It abounds in fish. The main stream and its tributaries drain fertile countries, and forests of gigantic trees. In these woods and these waters are the wild animals, land birds and water-fowl common to the American tropics. It communicates with the Amazon by the River Negro and the Cessiquiare, which was proved by the discovery made by the Jesuit Father Samuel Roman in 1743.

The Orinoco flows into the ocean by several mouths through a vast alluvial delta, the principal mouth was discovered by Columbus in 1498, and Diego de Ordaz was the first who entered it, he having sailed up it in 1531. "The sounding between Fort San Francisco de la Guayana and the channel of Limon, stated by Alcedo, is sixty-five fathoms deep, as measured in 1734 by the engineer Don Pablo Dias Faxardo, and at the narrowest part it is more than eighty fathoms deep; in addition to which, in the months of August and September, the river is accustomed to rise twenty fathoms at the time of its swelling or overflow, which lasts for five months; and the natives have observed that it rises a yard higher every twenty-five years." The ebbing and flowing of the tide is visible many miles from the sea.

The Orinoco is remarkable for its flood rising and falling once a year only.

It gradually rises during the space of five months—that is, from about the middle of March to September, and then remains for some time stationary. These alternate changes are said to be regular, and even invariable. The height of the flood depends much upon the breadth of the river. In one part where it is narrowest, it rises (as Alcedo has correctly observed) to the astonishing height of 120 feet. Its average rise is from sixty to seventy feet.

The following article, which is translated and abridged from the work of Depons, is, we believe, the most correct description yet given of the mouths of the Orinoco :

“It is presumed that the course of this river, for the first 100 leagues, is north, east, and south. In this part it leaves the imaginary Lake of Parima sixty leagues* from its left bank. The rivers which flow into the Orinoco give it, before it has run these 100 leagues from its source, as rapid a current and as great a body of water as any of the most considerable rivers. From the Esmeraldas to San Fernando de Atabapa, its course is from east to north-east. Between these places is the canal of Casiquiari, which forms the communication between it and the Amazonas, by the River Negro.

“At about 100 miles from the sea, the Orinoco, like the Nile, forms a sort of fan, scattered with a number of little islands, which divide it into several branches and channels, and oblige it to discharge itself through this labyrinth into the sea by an infinite number of mouths, lying north-east and south-west, and extending more than 170 miles. These islands increase so on the coast, that the mouths of the Orinoco are very numerous, but very few of them are navigable. It is computed that these openings amount to near fifty, and only seven of them admit the entrance of vessels, and these must not be of a large burden. An idea of the prudence and skill requisite for the navigation of these mouths, may be formed by what daily happens amongst the Guayanos Indians, who, although born on the islands, and from subsisting solely on fish, are so accustomed to the intricacies of the different channels, yet frequently lose themselves, and are obliged to allow the current to carry them out to sea, and then to re-enter, not without the most minute observations and endeavours to ascertain the proper passage. It even requires considerable skill to find the current; for the numerous channels have such different directions, that in the greater part of them no current at all is perceptible, and in the others the eddies or the winds give the currents a direction up the river instead of down. The compass is frequently of no use, and when a person is once lost, he is often obliged to wander several days among the Guayanos islands, conceiving he is ascending the river when he is descending, or that he is descending when he is ascending; and at length he probably finds himself at the very point from which he set out.

“1. The first of the mouths which are navigable is twenty-five miles south-east of the entrance of the Guarapiche River, and empties its water in the Gulf of Paria. It is called the Great Manamo. The Little Manamo runs in the same channel with it, nearly to the sea, and is navigable for shallops.

“2. The second mouth, Pedernales, is twenty miles north-east of the first. It runs from the east of the Island of Guarisipa, and falls into the sea three leagues south-west of Soldier’s Island, which is situated at the south entry of the Gulf of Paria. It is only navigable for canoes, or at the most for shallops.

“3. The third mouth, Capuro, is an arm of the channel of Fadernales, from which it branches off at thirty miles from the sea. Its mouth is in the southernmost part of the Gulf of Paria, thirty-four miles south-east of that of the channel of Padernales. The navigation is hardly fit for any vessels but canoes and shallops.

“4. Macareo, the fourth mouth, enters the sea six leagues south of Capuro, and is the channel of communication between Guayana and Trinidad. It is navigable for mo-

* These are French leagues, of about two and a half geographical miles.

derate-sized vessels, its channel is straight and clear, and it falls into the sea opposite the point and River Erin, in Trinidad.

"5. The fifth mouth is little frequented, on account of the difficulty of the navigation and the ferocity of the Indians inhabiting its banks. They are called Mariusas, and have given their name to this fifth passage of the Orinoco. This mouth is thirty-five miles east-south-east of the fourth.

"Between Mariusas and the sixth mouth are several outlets to the sea, which are navigable with the tide or the floods.

"6. Twenty-five miles more to the south-east is what is called the *Great Mouth of the Orinoco*; it bears the name of Bocca de Navias, Mouth of Shipping, because it is the only one which admits of ships of 200 or 300 tons burden.

"*Navigation of the Orinoco up to St. Thomas.*"—The grand mouth of the Orinoco is formed by Cape Barima to south-south-east, which is in 8 deg. 54 min. latitude north, and the Island of Cangrejos, lying west-north-west of the cape. They are twenty-five miles from each other, but the breadth of the navigable part of the passage is not quite three. The depth of water on the bar, which lies a little further out to sea than the cape,* is at ebb about seventeen feet.

"Immediately on passing the bar, the depth on the side of the island is four or six fathoms, whilst on the side of the cape it is not more than one and a half fathoms. The flats extend from Cangrejos seven leagues into the sea, but from Cape Barima they do not extend more than two leagues.

"Nearly one league from Barima is a river of the same name, which discharges itself into the Orinoco. The entrance is by a narrow channel one fathom and a half deep. On the same shores, south of the Orinoco, and two leagues higher up than this river, is the mouth of the Amaruco, which crosses a great part of the most easterly territory of Guayana. Shallops can sail ten or fifteen leagues up.

"Three leagues above Cangrejos is the Island of Arenas, which is small, and of a sandy soil. It is from twelve to fifteen feet under water in spring tides. On the south of it is a channel, often altered by the sand shifting. Before ascending half a league, there are two points, called by the Spaniards, Gordas. That on the north side has a flat, which runs out a little, but not enough to obstruct the navigation.

"The south shore of the Orinoco, eight leagues above Barima, the River Araturo

* The following sketches are from the voyage of Robinson up and down the Orinoco and Arauca:—

"Owing to the amazing rapidity of the current, in the Gulf of Paria, we were frequently obliged to come to anchor, to prevent our being drifted entirely out of the gulf.

"On the 15th we encountered a hurricane, accompanied by dreadful thunder, lightning, and torrents of rain. There were a number of passengers on board; and, owing to the smallness of the cabin, not more than eight or ten could get admission, while the remainder, twelve in number, got among the luggage in the hold till the violence of the weather abated.

"Our vessel stood the weather very well; and, on the 18th, at six o'clock, P. M., we entered one of the mouths of the Orinoco. This mouth was about the fifth or sixth to the south of the Macareo, and, although very narrow, was sufficiently deep for vessels drawing ten or twelve feet.

"It was not without some concern that we learned from the master of the vessel, that he had never sailed up this mouth before; and, reflecting on the late massacre of my worthy friend Colonel Macdonald and others, by the wild Indians, I thought the experiment unsafe.

"The thick and impenetrable foliage, of immense height, which crowded every inch of both sides the river, prevented the breeze from reaching our vessel, so that we found it absolutely necessary to warp the ship, or, in other words, dragged it onward, by cords fastened to the trees.

"On the 20th, at six, A. M., while at anchor, a canoe appeared, which had just started from a small creek in the bush, with about twenty men, women, and children in it. About forty canoes followed. They assured us that the mouth we had taken had rarely been passed, on the way to the grand river, before; because it was sometimes infested with banditti of the most blood-thirsty kind, and that it was to prevent depredations by such, that they went in such great numbers.

"These people, of a sort of red colour, are called Guaraunos, and are wholly naked, if we except a little piece of cloth, about six inches square, tied before them. They live in families in canoes. From time to time, especially when the river is low, they live in the bush, and subsist by fishing and hunting.

"We purchased from them, for some rum, straw hammocks, which they call *chinchoro*; reed-

flows in from the south, the source is in the savannahs of the missions. Its mouth is very narrow, but it is navigable for ten leagues.

“Eleven leagues above Barina is the Island of Pagayos, in the middle of the Orinoco, but nearest to its right bank. Its soil is white mud, and at flood-tide it is eleven feet under water. It was formerly much larger than it is at present, and is observed to diminish sensibly. Immediately above the Island of Pagayos, is that of Juncos. It is the most easterly of the Itamaca islands, which extend for a space of eighteen leagues up the Orinoco. They divide the river into two branches; the south branch being called Itamaca, and the north Zacoopana. Both of these are navigable; but the south branch, although the least, has by far the deepest water.

“The east entrance of the Itamaca branch, which is 900 fathoms wide, is formed by the Island of Juncos and Cape Barima Zanica, which juts out from the right bank of the Orinoco. A creek called Carapo, runs from the cape in-shore, and afterwards joins the River Arature.

“A little higher up is the mouth of the River Aguirre. Its source is in the tract of the missions of the Catalanian Capuchins. Its mouth, is very broad, and the depth ten or twelve leagues up from the Orinoco, is three fathoms. As this river does not pass through any cultivated country, its banks are wooded, and the trees on each side are so high, that sails are said to be useless, and vessels ascend and descend with the tide.

“Two leagues from the mouth of this river, in the middle of the Orinoco, is the little island of Venado, and on the south bank of the Orinoco, eight leagues above the Aguirre, is the branch of Caruzina. It proceeds from the Orinoco, behind the mountains, and thence takes its course south-east, thus forming an island. This branch has deep water at its entrance, but a point of the rising grounds of Itamaca nearly obstructs it for half a league. It spreads into an infinite number of branches.

“The River Itamaca joins the Orinoco from the south. Its mouth is narrow, but deep, having from sixteen to eighteen feet of water. A bank in the Orinoco runs across the mouth of the Itamaca, with the exception of a very narrow passage. This river, six miles from its mouth, divides into two branches, the first of which flows from the west, and runs through mountain valleys formed by it; the other flows from the savannah, near the mission of Polomar. The river is navigable up to where it thus branches off, for small craft and boats.

“At the mouth of the channel of the Island of Zacoopana commences a flat, running two leagues to the west, and often filling half of the river. Between this flat and another which proceeds from the Island of Palomas is the passage for vessels. Here the Orinoco, or rather that part of it which discharges itself into the sea by the Bocca de Navias forms only one channel for eight leagues westward. In this space is seen the mouth of a lake, on the south shore, at a little distance from the river. It extends to the foot of the mountain of Piacoa. From the middle of the Orinoco to the south, are seen the mountains of Meri.

“We now come to the chain of little islands which divide the channel of Piacoa from the river. They extend twelve leagues from south to west. On the north bank is the

baskets; parrots, to which they give the name of *loro* in this country; and monkeys, which they call *maraquito*.

“Many of these people are painted all over, and some on particular parts of their body only, with a sort of red nut, called *ruco*. This painting gives their person a singular appearance, while it also prevents the bites of insect vermin, of which there are millions here. Some of them had their heads decorated with a garland of parrots' feathers, others had figures of various shape painted on their body and face. They are well shaped, generally of small stature; yet occasionally we found some most stupendous figures among them. Their face is broad, almost round, their head is covered with long black hair, except over the face, where it is cut right across. It hangs over their breast, shoulders, and back. Their eyes are small; and their shoulders round, from the use of the paddle.”

Speaking of flies, mosquitoes, and a sort of wasp, he says:—“In short, it was the occupation of the day to keep these insects from resting on one or other part of the body, by which I was kept in a sort of torture.

“The impenetrable forests, in the Delta, are filled with every kind of vermin that can annoy the body or depress the heart of man.”

mouth of the Little Paragoan, from which runs a flat extending to the Great Paragoan. The two channels called Paragoan, unite before falling into the sea.

"Above the Great Paragoan the arm Pedernales branches off towards the coast of Trinidad. The Pedernales afterwards forms the divers channels.

"A league and a half up the river are the Red Bogs. This is the first place where, the Orinoco re-appearing to the north, is seen the Tierra Firme, or land entirely secured from the tides. The passages for vessels is near the two banks, the best is along the north bank. In the middle of the shallows or rather bogs, there is a very narrow channel (Guaritica), by which shallows pass in flood tides, or during the swelling of the river, to a lake, close to it.

"A league higher up is the mouth of the Guarapo channel. During summer it has but very little water, but for several years vessels carried on a contraband trade in mules, oxen, and in productions of Cumana and Venezuela, in exchange for dry goods.

"This channel, excepting at its mouth, is very deep, and admits of the navigation of large vessels, but on account of the high mountain through which it flows, they are obliged to use oars or to be towed. Two leagues above Guarapo, is the Island of Araya, close to the north coast.

"Towards the south coast are seen the cascades of Piacoa, they are formed by three or four ridges which extend from the middle of the channel to the south coast, but there is sufficient water on the north coast for large vessels. On this coast was formerly the mission of Piacoa and the Catalanian Capuchins. Here is excellent pasture, very fertile land, good water, and regular winds.

"After passing the three islands of Arciba, the next is that of Iguana. The river continues navigable on the south side. From the west point of the Island of Iguana, the small mountain of Naparenia is distant one league. It appears to be nothing more than a high rock.

"All this river coast as far as the isles of Iguana and Araya is full of sand-banks.

"From hence is seen the Island of St. Vicente, having a flat on the east part, which crosses the channel unto a little below the site of a former fortress, but which at full tide is of no inconvenience.

"Nearly half a league above Guayana, in the centre of the river, is the large rock of Morocoto, rather nearer the south bank than the north, and is visible in summer, but under water during winter. Not far from this rock is the Island of Mares, and on the south side is the rock of the same name, and another called Hache. The channel north of this island is preferable to that on the other side. Three leagues higher, on the south side, is Point Aramaya, a jutting rock. Opposite this point are the three rocky little islands of San Miguel. During floods they are nearly under water. On the right bank, opposite the village of San Miguel, are two islands, called *Chacarandy*, from the wood with which they are covered; they are divided by only a narrow channel. The Island of Faxardo is in the middle of the river, opposite the mouth of the River Caroni. On the right bank, and a league above this island, is the Island of Torno. It is separated from the main land by a small channel, and on the west point there are rocks, and a flat running to five leagues.

"Point Cardinal is on the south side of the island, three leagues above Faxardo. Nearly a quarter of a league from this point is a chain of rocks stretching to opposite Gurampo. During winter but one of these is visible, but in summer three are discernible opposite Gurampo. There is a port formed by Point Cardinal called Patacon. Gurampo is a number of rocks lying five leagues above the Island of Faxardo, on the north coast. These rocks form a port bearing the same name. A shallow runs from this port nearly north and south, on the east, Point Cardinal, and having on the west extremity three rocks, under water in winter. The Island of Taguache lies half a league from Gurampo, on the left bank. It is one league and a half from east to west.

"On the opposite side of the river is the Island of Zeiba, four leagues long, and more than one league broad. The channel separating it from the main land has very little water, excepting in the winter. Between the main land to the north and the Island of Taguache, there is a channel navigable at all seasons.

"The River Cucazana on the east point has a flat, running a little to the west, and oc-

cupying half of the river. At the mouth is the island of the same name, which nearly joins that of Taguache. It has also a flat on the west point which is in many places visible during summer.

"The Mamo channel has at its mouth a flat reaching nearly to the middle of the river, and seven leagues below the capital is another, lying north and south with the Island of Mamo, and having from the month of January to April only eight feet water. Vessels are obliged to be lightened in order to pass, which is the case with another channel which forms the Island of Mamo.

"After this bar is passed, are numerous rocks on the shore and in the middle of the river. The Currucay points are jutting rocks, and lie three leagues above Port St. Anne. Nearly opposite these points, in the middle of the river, is a large rock named La Pierre du Rosaire. Between this and the coast there are several others. To the north of the Pierre du Rosaire is a very narrow channel between the rocks lying under water. Vessels run great risks in summer, and in winter the current is so violent that if the wind dies away, they are in danger of being wrecked against the Pierre du Rosaire. A league above this is a point of rocks on the north shore, and some distance from this are three ridges near each other, and bearing south of the east point of the Island of Panapana.

"The Island of Panapana is a league above point Des Lapins, separated from the south shore by a channel moderately wide, but very shallow in summer. At the east and west points there are flats with very little water on them. That of the west point ascends more than a league, and inclines always to the south. Between this island, which is one league and a half long, and the north coast is the principal channel of the Orinoco. It is rather narrow and of little depth, except during the inundation.

"Two leagues higher up is the narrowest part of the Orinoco, called by the Spaniards *Angosturita*. Two rocks north and south form this strait. A little higher up, and nearly in the centre, is a large rock called *Lavadero*, or Washing-place, visible only in summer. Between this and the south coast there is a little island of stones, opposite which the River Maruanta discharges itself. Point Tinco to the north, and Point Nicasio to the south are also formed of rocks.

"St. Thomas de Angostura, the capital of Spanish Guayana, is the next place. It is situate at the foot of a small hill on the right bank of the river. There is a fort now—in 1846—called Bolivar, on the opposite side. This place was called Port Raphael, and is the thoroughfare of communication between Guayana and the province of Venezuela and Cumana. Between Port St. Raphael and the city there is an island called *Del Medio*, from being in the centre of the river. It is a rock under water in winter, but the north side is dry during summer. The principal channel is between this island and the city. It is at ebb tide about 200 feet broad, and about fifty more at flood.

"It is to be observed, that from the junction of the River Apure with the Orinoco to Angostura, the distance is estimated by Alcedo at eighty leagues, or about 200 miles. In all this space no other important river falls into the Orinoco on the south save the Caura and Caucapasia. From its source it receives almost all its tributaries from the left shore, and from the Apure it receives many which open to it from thence to Guayana all the commerce of the southern plains. The navigation of all the upper part of the Orinoco is among islands which obstruct the channel, and which throw its bed sometimes to the right bank and sometimes to the left; filled with rocks of all sizes and heights, of which some are even with the water, and others at a depth more or less according to the season. It is also subject to squalls, and cannot be navigated but by good pilots.

"The banks of the Orinoco are frequently bordered by forests of majestic trees, among which are birds of the most beautiful plumage. Various species of monkeys are seen crying, leaping, and gamboling. In other parts the view extends over plains with excellent pasture, and often extending twenty or thirty leagues."

Mr. de Humboldt observes,

"That the mouth of the Amazonas is much more extended than that of the Orinoco, but the latter river is of equal consideration with respect to the volume of water which it has in the interior of the continent, for at 200 leagues from the sea, it has a bed of from 2500 to 3000 fathoms, without the interruption of a single isle. Its

breadth before Angostura is 3850 fathoms, and its depth, at the same place, according to the measurement made by order of the king in 1734, in the month of March, the season when its waters are at the lowest, was 65 fathoms.

"This river, like the Nile and others, has an annual swell. This commences regularly in April and ends in August. All the month of September it remains with the vast body of water it has acquired the five preceding months, and presents a spectacle astonishingly grand. With this increase of water it enlarges, as it were, its natural limits, making encroachments of from twenty to thirty leagues on the land. The rise of the river is, opposite to St. Thomas, thirty fathoms, but it is greater in proportion to the proximity to the sea; it is perceptible at 350 leagues from its mouth, and never varies more than one fathom. It is pretended in the country, that there is every twenty-five years a periodical extraordinary rise of an additional fathom. The beginning of October the water begins to fall, leaving imperceptibly the plains, exposing in its bed a multitude of rocks and islands. By the end of February it is at its lowest ebb, continuing so till the commencement of April. During this interval the tortoises deposit themselves on the places recently exposed, but which are still very humid; it is then that the action of the sun soon develops in the egg the principles of fecundity. The Indians resort from all parts with their families, in order to lay in a stock of food, drying the tortoises and extracting an oil from their eggs, which they either make use of for themselves or sell. The water of the Orinoco is potable, and even some medicinal virtues are attributed to it.

"The Orinoco abounds in fish of various descriptions, but these, although they bear the same name as the fishes of Europe, are found not to correspond precisely with them in their nature or quality."—*Alcedo*.

In Mr. Robinson's account of a voyage up the Orinoco it is stated that,

"In this river there is an immense quantity of fish, especially when full. They are even so plentiful that there is a singular practice adopted by the boys for catching them. They tie three or four fish-hooks close together, pointing different ways, and without bait, they attach these and throw them into the river, from which they immediately pull them by sudden jerks, and thus they very frequently hook a fish, sometimes by one, sometimes by another part of the body.

"The alligators here are often very large and very plentiful. It is by no means uncommon for these monsters to come close in shore among the bathers (and bathing is, I think, used almost to excess among the people here) and carry one or more of them off. About this time, while walking on my terrace, I saw a little female child carried off by one of them.

"Bathers are often annoyed by another kind of fish, called the carabee, which is not so easily kept at a distance as the alligator. This monster is not large; but it has a mouth very capacious for its size. It fastens its teeth on any part of the body, which it often wholly removes, and generally leaves an ill-conditioned ulcer, which is very difficult to heal.

"It is a curious fact, that almost all the fish in this river are provided with natural instruments of defence or attack:—their nose, their teeth, their fins, or their tail, are the usual seat of these; and while many of them inflict a simple wound only, others cause excessive pain and inflammation."

The vast and fertile regions drained by the Orinoco and its many tributaries may be considered as still in a wilderness state. The small town of Angostura, or Bolivar, and the other small towns and villages on this river and its tributaries, are few in number. An Anglo-Saxon race, by the aid of steam-power would in a few years bring forth almost unbounded riches from the soil, pastures, and forests which extend along the numerous rivers flowing into the Orinoco, from the Andes of Santa Fé,—from the north and western parts of New Granada, and from the vicinity of many parts of the Amazon.—(For the Finances, Agriculture, Manufactures and Trade, *see* Statistics of Venezelea hereafter.)

CHAPTER XIV.

GUAYANA.

GUAYANA, or Guiana, comprehended originally the countries which border on the Atlantic Ocean between the mouths of the Amazon and Orinoco, and extending inland to an undefined distance.

FRENCH GUAYANA, or Cayenne, extends from the River Oyapoc, which separates it from Brazil, along the coast as far west as the River Marony, for about 200 miles. Inland to the Sierra Acaray; but as the situation of that range is very imperfectly known, the inland boundary is not determined; consequently, the area of French Guayana is conjectural, when it is computed at about 20,000 square miles. It may be much greater. The mountains in some parts approach within a few miles of the sea: and the rivers, among which the Oyapoc, the Organabo, and the Marony are the largest, are said to be obstructed by falls and rapids. The climate is deemed unhealthy, but its insalubrity must only be considered to pervade the swamps and low tracts between the mountains and the shores. The plantations are chiefly on the Island Cayenne, at the mouth of the river of that name: there are some on the neighbouring coast, and on the banks of the Organabo: the remainder of the country is generally in a wilderness state. Sugar, cotton, annatto, cloves, coffee, pepper, maize, &c., are raised. The French transplanted pepper, clove, and nutmeg trees from the Indian Archipelago, the first are said to thrive well. In 1834 the population consisted of not more than 22,000 individuals, of whom three-fourths were slaves. The aborigines cultivate small patches of ground, but gain their subsistence principally by fishing and hunting.

CAYENNE, the capital, is built on the northern side of the island of that name, and has a population of about 5000 souls. It exports the produce of the country, which in 1834 amounted to somewhat more than 80,000*l*. In the same year forty vessels (4374 tons) entered the harbour, and forty-four vessels (5032 tons) cleared out. (For an account of its subsequent Trade, *see* French Colonies Trade hereafter.)

DUTCH GUAYANA, or Surinam, extends along the sea-coast, between the River Marony on the east and the River Corentyn on the west. All Guayana, English, French, and Dutch, is assumed to extend to the sources of these two rivers, which rise probably in the Sierra Acaray, but scarcely any thing is known of the country south of 4 deg. north lat. The coast-line of Dutch Guayana extends in its windings, about 250 miles; and area of this country is variously estimated at from 38,000 to about 50,000 square miles. Along the sea-coast, to the distance of eight to fifteen miles inland, the country is flat, and little elevated above

the sea. The soil is dry, sandy, and impregnated with salt, yet adapted to the cultivation of cotton. At the back of this low tract the country rises higher, and spreads into savannas, covered with grass, and here and there with bushes and trees. Along the rivers for from half a mile to two miles the country is, where uncultivated, covered with large trees; this soil is chiefly an alluvial, black fertile mould, and chiefly cultivated as sugar, coffee, tobacco, cotton, and cacao plantations. About forty miles from the shores the country rises to a higher elevation, and the region between the rivers consists of rocky soils chiefly covered with trees. The rivers Marony, Surinam, Saramaca, and Corentyn are navigable to near the foot of the mountains, except where for some little distance some rapids or cataracts occur. The Surinam is navigable for large ships for about thirty miles from its entrance. The climate is unhealthy during the rainy season between June and August.

POPULATION.—The population consists of whites, negroes, mulattoes, and aboriginal tribes. The whites amount to about 17,000, and the negroes and mixed race to about 66,000. The number of maroons and Indians are unknown. In the mountains, and in some districts farther north, there are maroons, or runaway negroes, who formerly used to attack the settlements. The most numerous aboriginal tribes are the Arawaak and the Caribs. They live mostly on the produce of the mandioc, plantain, and maize plantations. Among the whites there is a considerable number of Jews, some of whom cultivate plantations in a separate district. The country was first settled by some Englishmen in 1634, but in 1667 the English settlements were given up to the Dutch. In 1808 the English got possession of Surinam, but restored it to the Dutch by the peace of Paris in 1814.

PARAMARIBO, the capital, is situated on the western bank of the River Surinam, eighteen miles from its mouth. It is regularly built in the Dutch style, with wide and straight streets, which are planted with orange trees. The houses in general are two stories high, and built of wood. Near to it, on the northern side, is the fortress of Zelandia, in which the governor resides. The population amounts to about 20,000 souls, three-fifths of which are negroes, or coloured people. They carry on a trade with Holland, to which they send the products of the country. The number of vessels employed in this trade in 1825 amounted to seventy-one, and the value of their cargoes exceeded 500,000*l*. Since that period the colony has not, according to the official reports, advanced in prosperity. The average quantity of sugar exported has amounted to about 25,000 tons, and of coffee to about 4,000,000 lbs.

BRITISH GUAYANA, the area of which is estimated at 76,000 square miles, lies between 1 deg. and 8 deg. 40 min. north latitude, and between 57 deg. and 61 deg. west longitude. It has a coast-line of more than 400 miles, running south-east and north-west: extending from the River Corentyne westward to the mouth of the

River Orinoco. Neither the western nor southern limits have been defined; and extensive districts are claimed either by Venezuela or by Brazil, and some by both governments. The western boundary-line, as claimed by the British government, extends from Point Barima, at the eastern embouchure of the Orinoco, nearly in a straight line southward to the River Cuyuny at its junction with the River Aruarua; it follows the course of the last river to its source in the mountain-range which divides the affluents of the Orinoco from those of the Essequibo, and then runs along the crest of these mountains to the source of the River Cotinga, or Xaruma; along which river it continues to its confluence with the Rio Tocoto, an affluent of the Rio Branco, which falls into the Rio Negro of Brazil. The River Tocoto then forms the boundary up to its source; and farther south it follows the mountain-range, between the Essequibo, to the sources of the Essequibo in the Sierra Acaray.

From the shores of British Guayana shallows, and in parts, muddy banks, extend from five to fifteen miles seaward, they are in parts dry, in others covered with not more than from three to four feet water. They render the approach even in small craft frequently impracticable, and extend in shoals at the mouths of the rivers. The shores are low, and on a level with the sea at high water. The soil is chiefly an alluvium of blue clay, impregnated with marine and vegetable matter. When these soils are drained and cultivated, they sink about a foot below the level of the sea; and require careful attention to the embankments and sluices. This fertile soil extends from two to eight miles inland. At the back of many of the settlements are swamps, of blackish vegetable matter: sometimes six or eight feet deep. Between the River Corentyn and the Demerara the low land of the coast is generally in the front of savannas, intersected by fertile, and generally well wooded tracts along the streams.

A range of sandy hills, from thirty to 120 feet above the level plain, crosses the country from south-east to north-west. An elevated mountain range separates the streams of the Carony, a tributary of the Orinoco, from those of the Mazaroony, a branch of the Essequibo.

The explorations of Mr. Schomburgk, in order to make boundary surveys through the interior since 1837, have unfolded to us magnificent regions of rivers, mountains, plains, and forests of gigantic trees, during his last expedition. He completed the circuit of the colony from its sea boundary to within forty-two miles of the equator in the space of nearly three years.

He left Georgetown in February, ascended the Essequibo, and reached Pirara on the 24th of March. He and his fellow travellers, on the 30th of April, departed at a period when the rains had swollen the Rupununi to such a height, that they ascended this river further than any large craft had ever done—the Wapisians declared they had never beheld such canoes.

At Watu Ticaba they experienced some difficulty in procuring Indians from

the left bank of the Rupununi as carriers of the baggage and provisions. On the 4th of June they continued their route, and leaving the savannahs, entered the magnificent forests of the interior, over the mountain chain, and over undulating ground, interspersed with Manica swamps, abounding in a species of cocoa (*theo bromia*), which the Indians gathered, as the pulpy arillus surrounding the seed has an agreeable vinous taste. The seed possesses a most delicious aroma. Mr. Schomburgk states they evinced astonishment when they saw him collecting these seeds and preparing them into a dish of chocolate, which he declares was the most delicious they ever tasted. These indigenous cocoa trees, Mr. Schomburgk informs us, they met with in innumerable thousands on this (5th of June) and the following day; and he adds, that these inexhaustible stores of a highly-prized luxury are here reaped solely by the wild hog, the aguri, monkeys, and the rats of the interior.

On the 8th of June the party reached a settlement of Taruma Indians, near the River Cuyuwini. In this neighbourhood Mr. Schomburgk had sojourned on his expedition in 1837. The site of the settlement, however, was changed to somewhat nearer the river. "Many of the inhabitants whom I saw on the former occasion," he says, "were dead, but nothing struck me more mournfully than the ravages death had committed amongst the Atorais—the immediate neighbours of the Tarumas—since my former visit; at that time the settlement consisted of 200 souls, which number was now reduced to less than thirty. The small-pox and the measles have done their worst among these people."

Here the travellers prepared their woodskins or bark canoes; with which, descending the Cuyuwini, they again entered the Upper Essequibo on the 21st of June. After several days' journey above the point of confluence of these two rivers, they arrived at two settlements of the Taruma Indians, where they sojourned some days, in order to afford time to inform the Maopityan Indians of their intended visit. In this locality Mr. Schomburgk found a variety of the bean tribe (the *leguminosæ*) which possesses a root, or underground tuber, that grows to an enormous size, fully equal to the largest yam. These roots were not at the time in full perfection, but their taste was somewhat between the yam and the sweet potato. The Taruma Indians called them Cùyupá. Mr. Schomburgk thought that, if it were possible to transplant these roots to the coast regions, they would be a most valuable addition to the list of native esculents. The roots are considered fit for use when the herb above-ground dies. A few of the seeds Mr. Schomburgk brought with him.

At the mouth of the Urana the travellers abandoned their woodskins. This river debouches into the Essequibo in about 1 deg. 37 min. north latitude. They continued their course landward, traversing a chain of hills, and on the 13th of July reached the sources of the Onororo, a tributary to the Essequibo; and, ascending an elevation of about 100 feet higher than the origin of the first river,

the sources of the Caphiwin or Apiniau, the head waters of the large river Trombetas (which afterwards amplifies itself opposite Phauxis, or Obedos, into the Amazon), were attained. The chain of hills here, about 2000 feet high, divides the rivers which flow southward into the Amazon, and those which were northward and westward in the Essequibo.

A few miles from this spot they came to a Maopityan village. In this place were two houses of singular construction—the larger was of unusually ample dimensions—it was in diameter eighty-six feet. They were covered in by two roofs, like pagodas, one roof being over the other, and between these the smoke found its way from the house. The party was received by the Indians, and then entered the larger edifice, “which then encompassed,” says Mr. Schomburgk, “the remains of the once powerful tribe of Maopityans, or Mawackwas.”

The village was nearly destitute of provisions, and the Indians were grinding rotten wood with the little cassava flour they possessed, in order to increase the quantity of bread baked from it. The travellers then proceeded for the territory of the Pianaghotto and Drio Indians, at the head of the Curtini or Curuwini River which Mr. Schomburgk suspected to be the Corentyne. This portion of the journey appears to have been very perilous. The Caphiwin—abounded in falls, some from forty to fifty feet in perpendicular height; and in a distance of sixty miles they descended 305 feet.

On the 29th of July they arrived at the confluence of the Caphiwin with the Wanamu, both of equal size, whose united streams form a river, called by the natives of those regions the Kaphu. The travellers had been now eleven days from their last starting point, and were informed by a family of Zuramata Indians, whom they found preparing a new provision field, that they would have to ascend the Wanama eight days more, before they could find an Indian settlement. This family was so poor, that they could not even give a plantain.

“The banks of the Kaphu River,” says Mr. Schomburgk, “are inhabited by the Tshikianas Indians; and eastward is the territory of the formidable tribe of Maipurishanas (Tapir) Indians. These are described by the other Indian tribes as cannibals. “But,” says our traveller, “of those warlike women, the Amazons, or Cunhapuyara Indians, no specific information could be procured. Our present journey appears to have chased them from their last hold—the upper Rio das Trombitas. Herrera and Acunna inform us that Orellana, while landing his troops at the mouth of the River Cunuriz—the present Trombetes—was attacked by Indians, among whom he observed women fighting at their sides; and as neither Brazilian nor European was ever able to ascend that river, the abode of the republic of women was planted near its sources. We felt almost regret to dispel the last hopes of seeing the romantic accounts realised, which Indians and Europeans alike have spread of the Amazons.”

The travellers ascending the Wanamu on the 5th of August, Mr. Schomburgk's boat was in advance, and turning round an angle of the river, two canoes with Indians were discovered advancing to them. They fled in the utmost dismay. The remainder of Mr. Schomburgk's journey is a record of fatigue, hunger, and difficulty, ascending and descending rivers, until the 24th of September, when they fortunately discovered the path leading from the River Corentyne to the Essequibo; and on the 13th of October, after suffering incredible privations, arrived at Georgetown.

RIVERS.—The Essequibo has numerous rapids, or falls, in the upper part of its course. Fifty miles from its mouth, and about ten miles south of its confluence with the Cuyuny, are the lowest rapids, above which the tide does not ascend. The Demerara River breaks over a great cataract. Several miles are rapids. The tide ascends within about ten miles of these rapids. In the River Berbice cataracts occur, up to which, a distance of 165 miles from the sea, along the windings, the river can be navigated by vessels drawing seven feet water. Vessels drawing not more than twelve feet may sail up 105 miles. The Corentyne is navigable from the mouth of the River Cabalaba for boats not drawing more than seven feet water, a distance of 150 miles from its mouth. In other parts it is obstructed by dangerous cataracts. Mr. Schomburgk considers the upper Corentyne the most perilous of all rivers to navigate; falls succeed falls, and he had frequently to lade and unlade the canoes several times in one day.

The River Rupunoony traverses the savannas south of the Pacaraima Mountains, and falls into the Essequibo, through the savannas, near the base of the Pacaraima Mountains. It is said to have no impediments to navigation.

CLIMATE.—Guayana has two dry and two wet seasons. On the sea-coast the *long* dry season begins about the end of August and lasts to the end of November. It is followed by the short rainy season, from November to the middle of February. Then by the short dry season, which continues to the middle of April, and is succeeded by the long rainy season, during which the rivers inundate the low lands. The greatest heat occurs during the long dry season, when the mean temperature is about 83 deg., but it is moderated by cooling sea-breezes; and during the night the thermometer sometimes falls to 74 deg. During the great rains the mean temperature is about 81 deg., and the heat oppressive when not moderated by the breezes. During the short dry and wet season the mean temperature is a little above 80 deg. The mean annual temperature is nearly 81·2 deg. The change of the seasons is attended by violent thunder-storms. The climate is considered tolerably healthy, except during the rains. South of the mountain-region two seasons only are said to occur. From the month of August to that of March there are only occasional showers; but from March to August the rain falls in torrents.

Guayana is highly favoured by climate and soil for the growth of every tropical product. The cultivation has been chiefly limited to sugar, coffee, and cotton; and to yams, cassava, plantains, bananas, sweet potatoes, maize, &c. The pine-apple, guava, the marmalade fruit, the delicious Anona, the saponilla, and the Brazil and Suwarrow nuts, are indigenous. The cabbage-tree is common, and there are several varieties of palms. The forest contains many kinds of excellent timber-trees, among which the mora (*Mimosa excelsa*) is said to be equal to the teak of the East Indies, and the green heart (belonging to the family of the *Laurineæ*), the sawary (*Pekea tuberculosa*), the bully-tree (*Achras balata*), the sirwabally, crab-wood (*Carapa Guianensis*), and purple-heart, are adapted for naval architecture and cabinet-work, &c. There are also many fibrous vegetables, which afford substitutes for hemp and flax.—*Schomburgk*.

LIVE STOCK.—The domestic animals are horses, mules, hogs, goats, and fowls. The rearing of black cattle is neglected; as they are more cheaply imported from the Orinoco districts of Venezuela; butter and cheese are also great articles of import; but herds of black cattle and horses graze on the savannas near the Pacaraima Mountains. Among the wild animals are the jaguar, armadillo, agouti, ant-bear, sloth, a great variety of monkeys, iguanas, alligators, and turtles. In the Essequibo and its affluents there are several kinds of large fish. Among the birds are several kinds of parrots, mackaws, and humming-birds, the flamingo, Muscovy duck, toucan, and spoonbill. Snakes are numerous, among which are the rattle-snake and the boa-constrictor.

Traces of iron-ore are discerned; no other metals have yet been found.

INHABITANTS.—The population of British Guayana is composed of aboriginal tribes and of foreign settlers: Dutch, English, Europeans, Africans, a number of Coolies, and the descendants of Europeans and officers.

By the census of the united colonies of Demerara and Essequibo, taken in 1829, the population consisted of 3006 whites, 6360 free coloured people, and 69,368 slaves. By the last census of the population of Berbice, taken in 1833, there were 570 whites, 1661 free coloured people, and 19,320 slaves. It is estimated that at present the whole population consists of 82,824 negroes, 8076 people of mixed race, and 4000 whites, to which the number of emigrants, since 1829 is to be added, which amounts to about 3100 individuals. The emigrants are partly whites from England and Malta, and partly Coolies.

British Guayana, as now constituted, consists of Demerara, Essequibo, and Berbice. The settlements consist of plantations along the sea-coast and extending up the rivers. Some few are found on the banks of the rivers a considerable distance from the sea, chiefly for cutting timber.—(*See the Statistics of the British American Possessions hereafter.*)

GEORGETOWN, formerly called Stabroek, the capital, is built on the east

bank of the River Demerara, which is here nearly a mile wide. The harbour, formed by the mouth of the river is safe, but not of easy access, as a bar of mud extends four miles out to sea, over which no vessel, drawing more than nine feet, can pass until half-flood; the channel along the eastern shore has nineteen feet depth at high water. The streets of the town are wide and traversed by canals; the houses are of wood, and seldom above two stories high; they are generally surrounded by a garden, or trees, and separated from each other by canals or trenches. The public building, which comprises all the public offices, is a large edifice. There are churches for the principal denominations of Christians, and public schools. The population is estimated at more than 20,000 souls, of which 16,000 are coloured people.

NEW AMSTERDAM, on the Berbice, extends about a mile and a half along the river, and is intersected by canals. The harbour is good, but intricate in its access. In the mouth of the river is Crab Island, which divides the river into two navigable channels, of which the eastern has seventeen to twenty feet, in depth, and the western only eight to thirteen feet at high water; a bar also lies across the mouth of the river, over which there are only seven feet depth of water at low tides. In 1833 the population amounted to 2900 persons. It exports the produce of plantations on the rivers Berbice and Corentyne.

Guayana was discovered by Columbus on his third voyage, 1498, when he reached the mouth of the Orinoco. The first settlement was formed by the Dutch in 1580 on the River Pomaroon, and called New Zealand, whence they spread eastward to the Essequibo and Demerara, but the progress of the colony was slow. In 1781 it was taken by Sir George Rodney, but it was restored to the Dutch in 1783. In 1796 it surrendered to the English, and was again restored to the Dutch by the peace of Amiens (1801). It was taken for the last time by the British, in 1803, and has since remained in their possession. In 1831, the colonies of Essequibo, Demerara, and Berbice, were united into one colony, named British Guayana, and in 1838 the slaves were emancipated.

GOVERNMENT.—The administration and legislature consist of the governor, the chief justice, attorney-general, the collector of the customs, and colonial secretary, to whom are added an equal number of persons elected from the colonists, by the college of the electors, or *kiezers*. This college consists of seven members, elected by the inhabitants of the colony for life. When a vacancy occurs in this colonial legislature, the college of *kiezers* nominates two candidates, of whom the colonial parliament selects one as a sitting member. The members are elected by the *kiezers* to serve for three years, and go out by rotation. Every member of this legislative body has a vote, and the governor has a casting vote. He has also an absolute veto on all laws and ordinances which have been passed by a majority.

(For the Agriculture, Navigation, and Trade *see* Statistics of the British Possessions hereafter.)

CHAPTER XV.

REPUBLIC OF ECUADOR.

ECUADOR extends from about 1 deg. 40 min. north latitude, to 5 deg. 50 min. south latitude, along the Pacific from the River Mira, south to the Rio Tumbez, for about 510 miles; and from some point not well defined between 69 deg. or nearly 70 deg. west, to 81 deg. 20 min. west longitude, or about 830 miles. Its boundary lines are very irregularly and very indistinctly defined, except on the Pacific, where it embraces the Gulf of Guayaquil, and several bays, headlands, and some roadsteads and seaports. This state claims as its boundary on the south with Peru, the River Tumbez up to its source in the Andes, and thence south-easterly along these mountains to the Rio Chinchupe, following the latter to its junction with the Rio Amazon south of San Juan de Bracamoros; Ecuadór has from thence a boundary between it and Bolivia, or Upper Peru, the Rio Amazon, as far as its boundary of Brazil, from which it is separated by a line beginning on the south side of the Amazon, from in about 69 deg. west longitude, and thence northward to the Rio Negro, which forms the separation on the north, between Ecuador and New Granada, and west from the Rio Negro to the Rio Mira until the latter flows into the Pacific.

The equatorial Andes, the hilly country between those mountains and the Pacific, and the great plateaux between the mountain range on the east boundary of Brazil are comprised within the republic of Ecuador, the area of which is vaguely estimated at about 320,000 square miles. These magnificent regions comprise every variety of configuration and scenery. Wooded declivities, rocky and naked precipices, great rivers, mountain torrents, elevated plains; with a soil and climate producing under the equator, the grains and fruits of Europe, while the lower plains yield the cane and tropical plants, and the elevated declivities afford extensive pasture. The valleys of the Rio Guayaquil and Daüli have plantations of cacao, and various other crops are or may be cultivated. The remainder of this region is less cultivated. Savannas occur in some extensive districts, and others are covered with lofty trees. In the regions from whence the rivers Guainia and Uaupes flow, mountains rising to moderate elevations prevail, and the country is chiefly wooded; savannas occur also near the foot of the Andes. Heavy rain, lakes, and stagnant pools, render many parts of Ecuador unhealthy.

The Amazon is descended on rafts or balsas from the mouth of the Rio Chunchunga; it becomes navigable for vessels below the Pongo of Manseriche, at St. Borja, for which vessels not drawing more than six or seven feet of water may as-

ceed: large vessels ascend as far as the mouth of the Rio Tigre. The tributaries of the Amazon which drain the plains, are navigable, some in a greater, others to a lesser extent. These are chiefly the Rio Santiago, which falls above the Pongo de Manseriche, the Marona, the Pastaza, the Tigre, the Napo, the Putumayo, the Yapurá. The Napo is as yet the only affluent much navigated. The navigation of the Yapurá is said to be obstructed by a cataract. The Guainia and its affluent the Uaupes, rise within Ecuadór; but these rivers are but little known. The Rio Guayaquil, the Rio Baba, and the Rio Daüli, by which produce is brought down to the port of Guayaquil, the Rio Esmeraldas, the Rio Santiago, and the Rio Mira, are all to some extent navigable.

Along the sea-coast, from the Gulf of Guayaquil to the Cape of St. Lorenzo, rain is said never to occur. The valleys of the rivers Daüli and Guayaquil have regular rainy and dry seasons. In the mountain-region, the climate is temperate during the whole year; some rain falls almost daily. The plains suffer from excessive rain and heat.*

In the western region of Ecuador, Indian corn, plantains, yams, cacao, tobacco, sugar, cotton, and different kinds of tropical fruit and vegetables are cultivated. From the elevated valleys and plains of the mountain-region wheat is sent down to Guayaquil and other low districts. Towards the southern extremity of the Andes there are extensive forests; the cinchona bark-tree is common. The Great Plains yield wax, gum, resin, and sarsaparilla. In the mountain-region and plains, cattle in large herds, horses, mules, and sheep are pastured. Turtles are abundant in the Amazon; their fat, under the name of *manteca*, constitutes an important article of traffic on the banks of that river. The fish called *manta* abounds on the shores of the Pacific. It is salted and sent to Guayaquil and the mountain-region for sale. Pearls were formerly fished. Some cochineal is collected near Loxa. Vessels are built at Guayaquil of the timber yielded by the western forests.

Gold is found in some of the rivers, silver ore occurs, but neither in any great quantity. Lead ore and quicksilver are found in some places. At Lo-Azoges quicksilver is worked. Salt is made along the coast at Cape Santa Helena, where it constitutes an article of trade for internal consumption.

INHABITANTS.—The population consists of the descendants of the Spaniards, and of Indians, and Mestizoes. The number of negroes has always been very small in Ecuador. The whites are most numerous in the valleys of the Andes, and in those of the rivers Guayaquil and Daüli, but in no part do they constitute more than one-fourth of the whole population. In the western region and in the mountains, the aborigines are of the Peruvian race, and speak the Quichua lan-

* Other accounts of the climate of the Ecuador differ. Dr. Smith gives a more favourable description of it, and says the sea-coast region is, in most parts, a fertile, verdant country.

guage. They are agriculturists, and employ themselves also in weaving coarse woollen and cotton stuffs. Along the coast many Indian families live by fishing and making salt. The Indians who inhabit the Great Plains, gain their subsistence almost exclusively by hunting and fishing on the banks of the tributary of the Amazon : they cultivate small pieces of ground. Abundance of sulphur may be procured at Tescan, near Chimborazo.

According to the census of 1827, the population of Ecuador amounted to about 492,000, exclusive of the Indians of the eastern plains.

ESTIMATED population of Ecuador.

DEPARTMENT.	Area in Square Miles.	Inhabitants.	Inhabitants to a Square Mile.
	number.	number.	number.
Chimborazo, or Ecuador.....	190,000	190,000	1
Guayaquil.....	25,000	150,000	nearly 5
Assuay.....	105,070	210,000	2
Total	320,000	550,000	

The department of Chimborazo is divided into four provinces, Pichincha, Chimborazo, Atacàmes, and Quixos. The province of Pichincha contains the Vale of Quito; and the province of Chimborazo that of Hambato and Alausi. The province of Atacàmes extends over the lower country west of the Andes, between the Rio Mira and Cape Passado; and that of Quixos over the plains east of the mountain-mass as far south as the Rio Napo. The navigable rivers Yapurà, Putumayo, and Napo, which fall into the Amazon; the Rio Esmeraldas, Santiago, and Mira, which flow into the Pacific, drain this department. The following are the principal places—IBARRA, at the foot of the volcano of Imbabura, 7572 feet above the sea-level: about 8000 inhabitants, who manufacture coarse stuffs of cotton and wool. Wheat is raised in the neighbourhood: the sugar-cane succeeds well; but of the latter, no great quantity is produced. OTAVALO has, it is estimated, 20,000 inhabitants, who manufacture woollen and cotton stuffs. QUITO, the capital of the republic, situated in a valley, which unites two plains of moderate extent, 9543 feet above the sea-level, near the foot of the volcano of Pichincha. Eleven snow-capped mountains are in view of this town. It is in parts regularly built, with wide and straight streets, and contains many handsome buildings, as the president's palace, formerly that of the viceroy, the palace of the archbishop, the cathedral, and the town-hall.

The buildings, as is generally the case in Spanish America, surround the *Plaza Mayor*. There is an university, an extensive building, formerly the college of Jesuits. Quito is said to contain a population of 50,000 souls, and has some manufactures of cotton, silk, leather, lace, and jewellery.

TACUNGA, situated near the southern declivity of the Alto de Chisinche, and near large ruins of a palace of the Incas: 3000 inhabitants.

LACTACUNGA, situated at the foot of the eastern ridge of the Andes, 9524 feet above the sea-level, and built of pumice-stone, has about 10,000 inhabitants.

HAMBATO, near the foot of the Chimborazo, 8859 feet above the sea, is situated in a wheat country, 12,000 inhabitants; the only frequented road from the mountain region to the coast of the Pacific passes through this town to Guayaquil.

Along the coast of the Pacific there are no large towns. Coasters find shelter in the harbours of Tumaco, Tola, Esmeraldas, Atacámes, and Canoa; these places have no foreign trade. The Missionos of Baeza, Archidonia, and Avila, east of the Andes, are now said to be deserted, although formerly described as very populous. Santa Rosa de Oas, situated upon the Rio Napo, where that river begins to be navigable; has a small population.

The department of Guayaquil comprises the southern country, between the Andes and the Pacific, including the fertile valleys of the Guayaquil and Dañli. It is divided into the provinces of Manabi and Guayaquil. The products are cacao, tobacco, cotton, maize, various tropical fruits, &c. Guayaquil, the capital, is situated on the right bank of the Guayaquil, about forty miles from its mouth; and large vessels ascend to the town; the rise of the tide at full and change is said to be about twenty-four feet. The town is built on low ground, fronting the river for about two miles; estimated population, 25,000 inhabitants. It supplies the settlement of the mountain coast with wine, brandy, and the sugars of Peru and Chile, and with European merchandise. These goods are carried by water to the head of river navigation, at Babahoyo or Caracol. From the head of navigation, merchandise is carried by the route of Guaranda and Hambato to the mountain valleys. In the vicinity of Guayaquil timber trees abound, of which vessels are built. Morro and Santa Helena have harbours, which are seldom visited. At Santa Helena sea-salt is made. At the island of Puna vessels take on board cargoes.

The Galapago islands, about 700 miles from the continent, between 1 deg 40 min. south latitude, and 40 min. north latitude, are dependent on the department of Guayaquil.

The department of Assuay, includes the mountain region south of the valley of Cuenca, the mountains of Loxa, the high country eastward to the Pongo de Manseriche, and most part of the plains between the River Napo on the north, and the Amazon on the south. Westward, the department extends to the south-eastern part of the Gulf of Guayaquil. It is divided into the provinces of Cuenca, Loxa, and St. Jaen de Bracamoros. The Santiago, Marona, Pastaza, Tigre, and Napo, tributaries of the Amazon, flow through and drain this region. The cinchona bark tree abounds in the mountain forests east of Loxa, rising at an elevation of from 6000 to 8000 feet. There are silver mines, but not extensively worked. There are also quicksilver mines, Los Azogus. Cuenca, the capital of the department, and an university city, is situated in a plain 8640 feet above the sea,

and contains a population of 20,000. Loxa, is 6768 feet above the sea, with 10,000 inhabitants, and has a trade in cinchona bark. St. Jaen de Bracamoros, near the banks of the Marañon, contains about 2000 inhabitants. Zaruma, situated on the western declivity of the Andes, in a mining district; 6000 inhabitants. Tumbes is situated near the Bay of Guayaquil. It has some trade. We must observe that all the foregoing statements, as to population, are based upon estimates made in the country, but which we consider no more than vague computations, given semi-officially by the authorities.

The manufactures of Ecuador are described as more important than those of any other of the South American republics. Coarse woollen and cotton stuffs are woven at many places in the elevated valleys. The inhabitants of coasts prefer English goods. There are manufactures also of silk, and some tanneries. But all these fabrics are produced at a much higher cost there, and are generally inferior to imported manufactures.

There are three roads or routes from the interior valleys to the Pacific, one from Hambato to Guayaquil, one from Quito to Esmeraldas, and one from Cuença to Naranjal. The first is the most travelled over. By the last the cinchona bark and the produce of the mines are brought to Guayaquil. Three routes lead to the eastern plains, but they are very little travelled over. Formerly the elevated valleys received European goods, principally by way of Cartagena and Popayán; from Guayaquil gold, silver, cinchona bark, tobacco, and some other articles are exported.

ECUADOR, which once formed part of the empire of the Incas, remained from the conquest under Spanish rule, until the revolution broke out in the Spanish colonies of South America. In 1811, Ecuador formed part of the vice-royalty of New Granada. In 1823 it adopted the convention of Cúcuta, and until 1831 it formed a part of the republic of Columbia. Since the dissolution of that union, it has formed itself into an independent republic. Governed by a president, chosen for eight years, and assisted by a vice-president and council of state. The legislature consists of two bodies, the senate, to which every province sends a member; and the house of representatives, the number of which varies according to the population, a member being elected for every 40,000 inhabitants.—(*See Statistics of the Spanish Republics hereafter.*)

CHAPTER XVI.

PERU.—GENERAL SKETCHES OF THE SOIL AND CLIMATE.

THE limits of the present republic of Peru extends from the mouth of the River Loa, (21 deg. 28 min. south latitude) to the entrance of the Tumbes in 3 deg. 30 min. 40 sec. south latitude. Its extreme length along the shores of the

Pacific is estimated at nearly 1700 miles. The greatest breadth is estimated at more than 1000 miles.

It is bounded by Ecuador on the north, on the west by the Pacific, on the south and south-east by Bolivia, on the east by Brazil. The southern and south-eastern boundaries are not, however, well decided.

Peru extends from the western declivity of the Bolivian and Peruvian Andes to the shores of the Pacific. This region is called the *Valles*. East of the *Valles* the *Montaña*, or mountain-region, comprehends the Peruvian Andes. Along the eastern side of the *Montaña* is the great upper plain of the Amazon.

The region of the *VALLES* has little or no wood, and includes but small districts fit for culture. Sandy or stony deserts prevail. In the mountain region, a large portion is rocky; the numerous valleys which intersect the mountains from south to north are generally fertile, especially the valley of the Rio Jauja. The eastern mountain region is covered with forests and other vegetable growth; the western mountains are nearly bare, and frequently without any vegetation. The eastern plains are cultivated only in small spots by the native tribes, who grow roots and maize; the greater part of these places are covered with forests. Savannas of considerable extent occupy parts of these plains, but these regions are but imperfectly known to us.

The whole sea-coast region of Peru is by all described as sandy, arid, bare, and scorched. The sea-coasts of the state of Ecuador are, on the contrary, described as well-wooded plains and villages.

Peru is traversed by two parallel chains of high mountains, called indifferently the Andes and the Cordilleras. Geographers may, to avoid confusion, give the name of Andes to the eastern, and Cordilleras to the western, chain. The western range follows the shores of the Pacific at a distance of sixty or seventy English miles. It is remarkable that all the streams flowing from its eastern slopes find their way through the chain of the Andes to the Atlantic. In all South America there is no exception to this rule. In no instance do the Cordilleras afford passage to any stream flowing from the Andes,—yet the former chain is lower than the latter, at least in Peru and Bolivia. The region between the Andes and the Cordilleras, comprising a vast *plateau*, or rather many table-lands, about 12,000 feet above the level of the sea. This *plateau* is scarcely inhabited. The whole region is called by the natives *Puna*, in Spanish *despolbado*. The general aspect of this plain is monotonous and dreary, the surface is principally covered with faded dull grasses; now and then a solitary stunted tree of the *quenna*, tracts covered with the reddish brown stalks of the *ratana*, which the few inhabitants use for fuel, or for roofing their huts. But here are found the llama, the alpaca, the huanacu, and the vicuna. Cold winds sweep from the frozen Cordillera over the plain, regularly accompanied for four months with daily violent snow-storms. Von Tschudi who resided in Peru from 1838 to 1842, inclusive, says,

"It often happens that the traveller passes suddenly out of these cold winds into very warm currents of air, which are sometimes two or three feet, oftener several hundred feet wide, and occur in parallel lines at repeated intervals, so that one may pass through five or six of them in the course of a few hours. I found them particularly frequent in the months of August and September in the highland plains between Chacapalpa and Huanavelica. As far as my repeated observations extend, the general direction of these currents is the same as that of the Cordillera, namely, south-south-west and north-north-east. My course once led me for several hours longitudinally through one of these warm streams of air which was not more than twenty-seven paces wide. Its temperature was 11 deg. R. higher than that of the contiguous atmosphere. It appears that these streams are not merely temporary, for the arrieros often predict with great accuracy where they will be encountered; nor are they to be confounded with the warm air of narrow rocky ravines, since they extend over the open plain. The cause of this curious phenomena is well deserving of minute inquiry by meteorologists."

Puna is also applied as a term to the effects which the rarified air of the plateau produces on the body and spirits; other names for which are "sorroche," "marreo," and "veta." These effects, experienced usually at an elevation of 12,500 feet and upwards, are difficulty of respiration, dizziness, palpitation of the heart, extreme lassitude and weakness of the limbs. The vessels of the eyes, nose, and lips often burst, and blood issues from them in drops. The mucous membranes of the lungs and bowels are affected, and sometimes accompanied by fatal hæmoptysis, and bloody diarrhœa. Dr. Tschudi seems to think that there must be some other unknown condition of climate at work besides rarefaction of the air, and it does so happen that regions abounding in *ore* are ill-famed for the *veta*. Men and other animals born in the mountains suffer little from the attack, strangers become acclimated to it; but some domestic animals, particularly cats, cannot live at an elevation of 1300 feet. Water, it is said, boils at so low a temperature in the high regions, that potatoes and meat cannot be cooked in less than twenty-four hours' boiling.

We extract the following from Tschudi's recent valuable work, which describes one day's travelling in the horrid *Puna* region through the deep snow that had fallen overnight:—

"I rode along a sorry track up the gentle declivity, often being compelled to make wide detours round rocks or swamps, which I could not pass over. The latter are particularly irksome to the traveller, for he loses much time in going round them, and if he attempts to pass through them he is every moment in danger of being swallowed up with his beast, or if less unlucky he may leave the floundering animal to its fate, and pursue his way on foot. After the lapse of several hours, the sun at last dispersed the mist, the snow disappeared in a few minutes, and I looked round on the lonely landscape with renewed vigour. I had reached a height of nearly 14,000 feet above the sea. On both sides of me rose the peaks of the Cordillera clothed in eternal ice, with single gigantic pyramids towering to the heavens. Behind me lay, deep and deeper, the obscure valleys of the lower mountain regions, with their scarcely discernible Indian villages, and stretching far away until they blended with the horizon. Before me lay the immense billowy extent of the upland plains, here and there broken by long low craggy ranges of hills. It seemed to me as if Nature breathed out her last breath in these lonely snow-fields of the Cordillera. Here Life and Death meet together, and wage their everlasting warfare; and how might the conflict end for me, for my lot too was involved in the issue? I could not tell.

"How little life had the sun awakened all round me, where the dull green *puna*

grass, hardly a finger high, blended with the greenish glaciers! Glad was I to greet the purple gentiana, the brown calceolaria, and other old acquaintances of the vegetable world. Not a butterfly hovered yet in the thin atmosphere, not a fly or winged insect; at most the busy naturalist might find a dusky beetle under a stone—a rare prize. Here and there the low tortoise crept out of its hole, or a half-starved lizard lay on a stone warming its lithe limbs in the sun. As I rode further, living creatures met my view in more abundance, beasts and birds, few in species, but individually numerous. Amazing is the wealth of animal life in these mountain plains. The vital exuberance of the tropics seem to triumph all over the bleak cold of the Puna, and the scorching sunshine of the Llanos; there the first fall of rain, here the first glimpse of the sun, calls it forth with astonishing quickness. The blank monotony of the region had almost disappeared. Herds of *vicuñas* approached me inquisitively, and fled away again with the speed of the wind. In the distance I saw quiet stately groups of *huanacus*, gazing suspiciously on me and passing along; single roes started up from their rocky lairs, and rushed up the slopes with loud brayings; the curious horned puna-hart (*tarush*) came slowly out of its hole, and stared at me with its great black, wondering eyes, whilst the lively rock-hares (*viscachas*) sported familiarly, and nibbled the scanty herbage that grew in the clefts of the rocks.

“I had plodded on for many hours, observing the varieties of life in this singular alpine region, when I came upon the carcass of a mule, which had probably fallen under its burden, and been left by its driver to perish of hunger and cold. My presence startled three ravenous condors from their repast. Shaking their crowned heads, and darting fiery glances at me from their blood-shot eyes, two of them rose on their giant wings, and hovered threateningly, in ever-narrowing circles, round my head, whilst the third, croaking furiously, stood on the defensive near the booty. Holding my gun in readiness, I rode cautiously by the critical spot, without the least desire of further disturbing the banquet. It was now two o’clock in the afternoon, and I had been riding on a continual, though gradual, ascent since dawn. My panting mule slackened his pace, and halted from time to time, and seemed unwilling to climb a height that rose before me; I alighted to relieve the animal and my own limbs at the same time, and began to walk up the hill; but I immediately experienced the effects of the rarefied air, and I felt at every step an uneasy sensation I had never known before. I was obliged to stop for breath, but I could hardly respire; I tried to move, but was overcome by an indescribable oppression; my heart beat audibly against my ribs; my breathing was short and interrupted, a world’s load seemed to be on my breast; my lips were blue, tumid, and cracked, and the blood oozed from the swollen vessels of my eye-lids. My senses were leaving me; I could neither see, nor hear, nor feel distinctly; a gray mist floated before my eyes, tinged at times with red, when the blood gathered on my eye-lids. I felt myself involved in that conflict between life and death, which I had before imagined in surrounding nature; my brain reeled, and I was compelled to lie down. Had all the riches of the world, or the glories of eternity, been but a hundred feet higher, I could not have stretched out my hand towards them.

“A heavy fall of snow came on, accompanied with an icy wind, and in less than half-an-hour the ground was everywhere covered with snow a foot deep. Swamp and hill, dale and crag, seemed now one undistinguishable surface; all trace of my path was lost, and my position was growing worse every moment. Had I then been as well acquainted with the Puna as I afterwards became, I would have shaped my course by the flight of birds, but unluckily I followed the fresh track of a herd of *vicuñas* which was lost in a swamp. I discovered this too late; my mule had suddenly sunk in so deeply that it could not scramble out; in great trepidation I alighted cautiously, and with incredible difficulty contrived to dig out the legs of my beast with my dagger. After wandering up and down in all directions, I at last found the path, which was marked by skeletons protruding above the level of the snow. They were the remains of beasts that had fallen under their load—a welcome and yet ominous token for the lonely wanderer! The clouds were now suddenly rent, and the blazing light of the tropical sun was reflected from the dazzling surface of snow. My eyes were instantly smitten with *surumpe* (ophthalmia); they began to smart violently, and it was only with a handkerchief before

my face I was able to pursue my way, tormented with the apprehension of chronic ophthalmia, or of total blindness.

"Half an hour afterwards the scene was repeated over again—thunder, lightning, wind, and snow, then sunshine, then storm again. I continued my route with extreme difficulty, the mule hardly able to drag its limbs through the accumulated snow. Night was coming on; exhausted with cold, hunger, and fatigue, I could scarcely hold the bridle, and my feet were insensible, though partly protected by the broad wooden stirrups. I had almost given myself up for lost, when I observed a cave beneath an overhanging rock. I hastened to explore it, and found it would afford me some shelter from the wind. I unsaddled the mule, tied it to a stone, spread my cloak and trappings for a bed on the damp ground, and appeased my hunger with a little roasted maize and cheese. I then lay down, but was long kept awake by the piercing clamours of the night birds. At last I slept, but was again awakened by an intolerable burning and smarting in the eyes; the lids were glued together with coagulated blood. There was no hope of sleep or rest, and I thought the night would never end. When I reckoned that day must be dawning I opened my smarting eyes, and discovered all the horrid misery of my situation. A frozen human corpse had served for my pillow. Shuddering, I went in search of my mule to quit the dismal spot, but my distresses were not yet at an end. The poor beast lay dead on the ground; in its ravenous hunger it had eaten the poisonous garbancillo. Poor creature! Many a hardship had it shared with me. I turned back to the cave in despair; what could I do? At last the sun shone brightly, the snow was gone; I felt my spirits wonderfully revived, and began to inspect the body of my lifeless companion. Was it one of my own race, a traveller who had perished of cold and hunger? No, it was a half-caste Indian, and many deadly wounds in the head showed that he had been killed by the slings of Indian robbers, who had stripped him naked, and hid him in the cave.

"I seized my gun and shot a rock hare, gathered a little fuel, and using a bone for a spit, I roasted the flesh, and made a not very savoury breakfast. I then waited quietly to see what might befall. It was about noon when I heard at intervals a monotonous short cry, and starting to my feet at the well-known sound, I ascended the nearest rock, and perceived the two Indian llama drivers I had seen the day before. I prevailed on them by means of a small present of tobacco, to let me have one of their llamas to carry my baggage. I cast a handful of earth on the corpse of the murdered man, and left the unlucky spot."

Rivers.—The small rivers that flow into the Pacific are chiefly used for irrigating lands; none of them are navigable, except the Rio de Piura, for some months, about twenty miles, as far as the town of Piura. Many of the rivers are dried up for several months of the year; a few flow to the Pauba, the others to the eastern waters. The mountain rocks have some streams which might supply irrigation, and even the most arid districts yield luxuriantly when watered.

The Montaña is drained by the Marañon, and its affluents the Huallaga and Ucayali. The Marañon is navigable from the mouth of the Rio Chuchunga downwards. No obstacle to navigation occurs below the Pongo for vessels drawing no more than six to seven feet of water, as far up as the junction of the Ucayali it may be, ascended by larger vessels.

The Lake of Parinacochas, which has no outlet, is surrounded by high mountains: and its surface is said to be 10,000 feet above the level of the sea: the water is brackish. The Lake of Titicaca occupies an area of about 4000 square miles; from it the Rio Desaguadero, flows south-south-east, in gentle course

and it is lost in swamps and lakes, about 19 deg. south latitude. The Lake of Titicaca is 12,795 feet above the sea-level, and the valley, on an average, 13,000 feet. The length of the valley is about 300 miles ; its breadth varies from thirty to sixty miles. Its area is estimated at 16,000 square miles, the lake included. Several passes lead from the valley to the low countries on the east and west, and traverse the two chains of the Bolivian Andes. The average elevation of these mountain passes is about 14,600 feet above the sea-level, or 1600 feet above the level of the valley.

The climate of this valley is not subject to great varieties of temperature; neither great heat nor cold are experienced; except during the nights from May to November, when ice is formed. The winter is dry, the sky is cloudless, there is neither rain nor snow. Snow falls at the beginning and end of summer or the rainy season, which commences at the end of November and terminates in April. During the summer it rains, not heavily, but almost constantly, during the day; at night the sky is cloudless. Even in February the thermometer never rises above 60 deg; and in July it descends only during the night to 28 deg. The whole valley has but little wood; as a substitute the natives use the rushes which grow along the banks of the lake. This valley chiefly presents a beautiful green turf. Some parts are under cultivation; rye and barley are sown, but as they do not ripen, are cut green as fodder for beasts of burden. Quinoa (*Chenopodium quinoa*) and potatoes are grown.

The Lake of Chinchacocha, or Reyes, which receives the streams descending from the table land of Pasco, and from which the Rio Jauja issues, is about thirty miles long, with an average width of five miles; contains several islands. The Lake of Llauricocha is considered the source of the Marañon. Little is known of this lake.

Administrative Divisions.—The department of Truxillo is divided into the provinces of Caxamarca, Chachapóyas, Chóta, Maynas, Piura, Jáen, Lambayeque, Huamacucho, and Patás. The products of those are, rice, sugar, cinchona-bark, sarsaparilla, copaiva balsam, dragon's blood; bullion, the product of the silver mines, and various fruits and vegetables. Payta, with about 5000 inhabitants in the valleys, has a tolerable harbour, and some trade; Piura, with about 8000 inhabitants and some manufactures; Lambayeque, with about 10,000 inhabitants, an open roadstead, carries on some trade; Chiclayo, about three miles from Lambayeque, with about 8000 inhabitants; Truxillo, the capital of the department, built in a fertile plain, contains about 9000 inhabitants, has some trade, though its harbour (Huanchaco) is an ill-sheltered roadstead. Caxamarca, in the valley of the Marañon, has about 7000 inhabitants, and some manufactures of woollen cloth and hardware. It is situated in a plain 370 feet above the sea, and in the vicinity of mines, and not far from the mines of Gualgayo. Chachapoyas, with about 4000 inhabitants, is a trading town

on the road from the vale of the Marañon to the Huallaga. Moyobambo, with about 5000, and Tarapoto, with about 4000 inhabitants, have fabrics of coarse cotton stuffs.

The department of Junin is divided into the provinces of Huari, Caxatambo, Huaylas, Conchucos, Pasco, Huamalis, Huanaco, Tarma, and Jauja. The products are, silver from the mines of Pasco and other places, sugar, Indian corn, rice, cinchona bark; the rock-salt from the banks of the Huallaga. Pasco, or Cerro de Pasco, is situated on the table-land which bears its name, at an elevation of 14,278 feet above the sea, and contains a population of between 12,000 and 16,000 souls. North of Huari, in the upper vale of the Marañon, Caxatambo has about 6000 inhabitants in the vicinity of silver-mines; Huanaco, in the upper vale of the Rio Huallaga, is situated in a fertile country, and has about 9000 inhabitants. It is about twenty leagues from Cerro de Pasco, with a descent of about 7000 feet. In its fertile valley are produced maize, wheat, beans, potatoes, &c.* Tarma, in the upper vale of the Rio de Jauja, is the capital of the department, has 6000 inhabitants, and some cotton and woollen manufactures.

Tarma is described by Dr. Smith as "the favourite place of resort of sickly persons from different parts, especially Lima, and the rigorous climate at the mineral works of Yauli, whence the rheumatic miners, after their own hot springs fail to cure them, flock to the Estrada, or to the ball and tertulia of the blooming Tarmenians. All its peaceful inhabitants are agriculturists; and mostly all the resident families emigrate during harvest-time to little farms in the vicinity of this pretty Cerrano town, which is considered one of the most agreeable and civilised in all the sierra, and wherein the better classes, even as in the provincial towns on the coast, desire to adopt the manners of the capital as their standard. Near Tarma is a beautiful cascade, and many peach and apple orchards, with lanes lined with poplars, and perfumed with wild mint and many sweet and fragrant flowers in the wet season, when its hills are verdant, its air pure, and its people joyful."

* Dr. Smith, describing the Valley of Huanuco, says,—“But the plains that spread round the base of the hills and mountains that go to form the Vale of Huanuco, are never allowed to take upon them the withered face of winter. By the aid of rivulets from the mountains, sometimes diverted from their natural channels by art, and carried, by circuitous aqueducts of many miles in extent, the numerous flats among the recesses of the heights and slopes, frequently elevated much above the lower plains, are kept ever verdant and productive, in like manner as the fields and enclosures in the bottom of the vale are fertilised by canals from the river. The best sugar-cane comes to maturity in about eighteen months or two years, and yields several cuttings of after-growth. The lucern or alfalfa, without the aid of top-dressing, gives six crops annually for an indefinite number of years; and in some favoured spots it yields a cutting in six weeks, and therefore gives eight crops yearly. The writer had a plot that yielded, at this rate, *alfalfa* of about a yard in height, and in good flower. The plantain, the richest tuna, or Indian fig, grow in abundance; the finest pine-apples are brought from the neighbouring Montaña, where vegetation is much more rapid and vigorous than in the Vale of Huanuco. In this vale, however, the palta and cheremoya mellow on the branches in their native soil. The maguey, coffee, cotton, and vine, the pomegranate and orange, the citron, lemon, and lime, &c., flourish here; and the meanest villager, as well as the humblest lodger under a cane-roofed shed, inhales with every breath the odours of never-failing blossoms. As the morning sun gilds the high ridges of this happy valley, its inhabitants are animated to the daily labours of the field by the cheerful voice of the pretty-plumaged inmates of their well-shaded bowers. The city of Huanuco is the principal seat of recreation for him who wastes his strength and frets his temper in the too often delusive pursuit of wealth in Cerro Pasco, and other inclement mining localities in the neighbourhood.”

The department of Lima is divided into the provinces of Cercado or Lima, Chancáy, Canta, Huaura, Huarochirí, Yauyos, Canete, and Ica. The products are chiefly maize, sugar, wine, brandy, tobacco, and salt is made.

The department of AYACUCHO is divided into the provinces of Huancabelica, Lucánas, Tayacája, Castroviréyna, Parinacochas, Guamanga, Guanta Congallo, Anco, and Andaguailas. The products are chiefly silver and quicksilver, cattle, horses, and mules. Some maize and sugar are cultivated in some of the lower districts. The capital, Guamanga, built on the declivity of some mountains, has about 26,000 inhabitants, a cathedral, a university, and an ecclesiastical seminary. It is situated on the road from Lima to Cuzco. A few miles east-north-east of Guamanga, on the plain of Ayacucho, General Sucre terminated the Spanish dominion over South America by a decisive victory. Huancabelica, west of Guamanga, has mines of gold, silver, and quicksilver: the quicksilver mines were formerly very rich. It contains about 8000 inhabitants.

The department of Cuzco is divided into the provinces of Cercado or Cuzco, Quispichanchi, Urubamba, Abancay, Aymaraes, Cotabambas, Chumbivilcas, Paruro, Calca, Paucartambo, and Tinta: the great majority of the population are of Aboriginal race. Woollen and cotton stuffs, and leather, are manufactured by them. Cuzco, the capital of the department, originally said to have been built by Manco Capac, the founder of the empire of the Incas, is situated in a broad valley, about 11,250 feet above the surface of the sea. It contains several ancient ruins. The population, about 40,000, manufacture wool and cotton stuffs, leather, furniture, and embroideries, reputed for richness of design and work.

The department of PUNO is divided into the provinces of Lampa, Azangaro, Carabaya, Chuquito, and Guancani. Quinoa, potatoes, and barley cut green for fodder, are the chief agricultural products. The produce of the silver mines, and of the cattle are exported from this department. Goods are transported from the port of Arica to Bolivia by the mountain passes over the Altos de Toledo, and of Las Gualillas. Puno, the capital, 12,832 feet above the sea, has about 9000 inhabitants; Chuquito about 5000 inhabitants: both these towns are near the western banks of the Lake Titicaca. Near Puno there are silver mines.

The department of AREQUIPA is divided into the provinces of Camana, Condesuyos de Arequipa, the Cercado or district of Arequipa, Moquegua, Arica, Tarapacà, and Cayllóma. The produce of the silver and copper-mines, cotton, wool, and sugar, are exported. Saltpetre in abundance is procured in the province of Tarapacà, and shipped chiefly to England. *Acari*, which is built in a fine plain not far from the sea, has about 6000 inhabitants; Point Lomas, its port, has good anchorage. Arequipa, in the vale of Arequipa, has about 30,000 inhabitants. It is a tolerably well-built and trading town, situated 7797 feet above the sea, and a few miles from the volcano de Arequipa, which is 18,300

feet high. Moquegua, has about 10,000 inhabitants. Tacna, about thirty miles from the sea, and 1700 feet above its level, is a depôt for European merchandise used in the Southern Montana, and the greater part of Bolivia, about 9000 inhabitants. Arica, the port of Tacna, has a good harbour, and about 3500 inhabitants. Iquique, with about 1000 inhabitants, exports the saltpetre procured in the surrounding country.

The plains east of the Montana are not included in any of the departments, and are inhabited by wild and independent tribes. The missions which were formerly established among them, have been either destroyed or abandoned.

CHAPTER XVII.

DESCRIPTIVE SKETCHES OF PERU.

THE most recent accounts upon which we can rely are those included in the narrative of the United States exploring expedition, those of Tschudi, and some manuscript accounts which we possess. Messrs. Pickering, Rich, Agate, and Brackenridge, of the United States exploring expedition, obtained from the commodore permission to make an excursion to the Cordilleras of Peru, for the purpose of making botanical collections.

In Lima the journey was considered as a very serious undertaking, and likely to be attended with much danger, from the banditti who frequent the route they intended to pass over,—that to the mines of Pasco. They supplied themselves not only with blankets and horse-furniture, but with all sorts of provisions, and particularly with bread, of which they took as much as they could carry, notwithstanding the country was described as well inhabited. After the delay of a day, the passports came in the form of a letter of protection and recommendation from *Lafuente* himself, to the local authorities throughout all Peru, couched in the most liberal terms, and treating the affair with as much importance as if it were a national one. It is a regulation that the names of all who receive passports shall be published in the official gazette; their intention, therefore, became known to all Lima. From the few who are gazetted, it would appear that but a small number travel into the interior, or else that the regulation is not very strictly complied with.

The injunction to render the party assistance in case of need was very strong, and among other things specified to be furnished was *clothing*, which was thought to look somewhat ominous in this country of banditti. In spite of the positive terms in which the passport was expressed, it was found of little effect in procuring them mules or horses; and it was not till after much trouble and disappointment that horses were at last obtained from the post establishment.

On the 16th of May they were ready to set out.

Their route lay along the margin of the extensive plain that borders on the sea; columns of dust and particles of sand were seen rising from the heated plain, stirred by the action of the wind. Clouds of smoke, too, were visible in the distance, proceeding, according to the information of their guides, from the burning of the *cane-brakes*. The Peruvian willow, so much resembling the Lombardy poplar in its form, was much admired, and the contrast between the barren clay-coloured hills and the bright green of the irrigated fields was very remarkable.

Three leagues from Lima they passed through the ruins of an Inca town, situated (as they uniformly found them afterwards) on the border of an irrigated valley. The walls of the town were at right angles, very thick, built of mud, and unburnt brick; the hills were covered with the ruins of Indian buildings, some of them resembling fortifications.

They turned up a beautiful valley, on the irrigated fields were herds of horned cattle, horses, and goats, a proof that the irrigated land is not exclusively used for tillage.

Around Caballeros, seven leagues from Lima, are extensive meadows and fields of clover.

At midnight there was a shock of an earthquake. The house was rolled and shaken as if it had been on an agitated sea. The natives of the adjoining huts ran out into the road, uttering shrieks, striking their breasts, and offering prayers to the Holy Virgin to protect them. The shock lasted altogether about two minutes. It produced a slight nausea, like sea-sickness, which continued for some time afterwards, and a bewildering sensation, that rendered it difficult to collect their ideas to speak. This earthquake was the most violent that had been experienced for some time, and it was sensibly felt at Lima and through all Lower Peru.

On the 17th, the party set out up a dry mountain valley, the soil of which was composed of stones and loose powdery earth. This kind of ground continued for five leagues, with not a drop of water, nor was a plant or bird collected; nothing was seen growing but a few *tillandsias*. On this route they passed many crosses, marking the spot where there had been loss of life.

Immediately on the confines of this dreary waste, is Yanga, a deserted-looking place, but having some good gardens and orchards.

During the day they had been much annoyed by sand-flies and fleas; besides these, they had a few *mosquitos*, but the latter are seldom seen in Peru.

The screaming of parrots during the night, announced that some change had taken place in the vegetation. The land in the vicinity was cultivated, and some orchards and fields of clover were seen; the mountains, previously gray with *tillandsias*, had now assumed a greenish tinge. *Agaves* made their appearance here; and, a few miles beyond, the hills became green: all showed that a different region had been entered. The inclined roofs of the huts showed that rains were experienced.

The valley now became more contracted, level ground was seldom seen ; the mountains increased in elevation. Cascades were springing from almost the very summits of the high peaks ; cattle were grazing, and occasional cultivated patches were mingled with the pasture-grounds ; irrigation was no longer necessary ; and the Cordillera plants of the *Flora Peruviana*, with the vegetation described by Humboldt and Bonpland, were recognised. At noon they reached Obrajillo, the rendezvous of the two celebrated Spanish botanists, Ruiz and Pavon, authors of the *Flora Peruviana*.

Obrajillo, Canta, and San Miguel, about a mile distant from each other, are said to contain three or four thousand inhabitants. At Obrajillo, some difficulty in getting mules occurred. The horses they had brought from the low country were not considered capable of standing the cold and fatigue of the mountains ; and at Lima, they refuse to allow their mules to cross the mountains.

Obrajillo, the largest of the three towns, contains about one hundred cottages. It has a stone church, with two towers, apparently of some age, which fronts on the open square. The dwellings are of one story, without floors and almost without furniture ; yet it is said to be the residence of many wealthy people. It was impossible, from appearances, to determine, the high and low, the rich and the poor, all seem to live in the same style : but there are many pretty gardens and fields, under a good state of cultivation. The roadside itself looked like a flower-garden, and flowers of every hue were seen on either side, calceolarias, lobelias, &c.

Here was the first point where they had met the llama used as a beast of burden ; the load which they carry is from seventy to ninety pounds.

On the 19th, at an early hour, some vagabonds, assuming the name of Chilians, went the rounds of the village, helping themselves to every thing they desired, to the utter dismay of the inhabitants, who made no resistance. The consequence was, that the party, having neglected to supply themselves with bread the evening before, now lost the opportunity of doing it. This was a serious inconvenience, for Obrajillo supplies the upper country with bread, as Lima does the lower, and it is procured with difficulty, except at these two places. Potatoes were therefore taken as a substitute, though a very inconvenient one, from their great weight and bulk.

At Culnai, a village with about thirty cottages, believed to be 10,000 feet above the sea, cultivation ceases, ending with the potato, *tropæolum*, *oxalis*, and *basella*. The second region of plants also terminates here ; which is succeeded by the "Paramera," or cold pasture region of the Andes. This third region gives growth to a set of plants which make a gradual transition from those of the second region to low alpine scraggy bushes, none of which exceed two feet in height. The *Paramera* is remarkable for a dense sward of coarse grass, and low herbaceous plants, principally of the order *compositæ*. The flowers of the latter, it was remarked, were particularly large in proportion to the plant. These

form a rich pasturage for the flocks and herds, which are seen feeding in the valleys and along the sides of the hills.

No cultivation is attempted beyond Culnai, and but two species of *cacti* were met with above this point.

The exploring party, from a northerly direction, diverged more to the north-east. The temperature fell as they ascended, the air grew clear and bracing, and the scenery as they advanced became, from Culnai, interesting and sublime. To its wild and precipitous features was now added the high snowy peak of La Vinda in the distance, and some few spots of snow were occasionally seen in places sheltered from the sun's rays. The mule-paths had become narrow, and when they met with mules, which was often the case, it became necessary to turn under the rocks until the path was clear.

The sagacity of these mules is remarkable. They cling to the wall side, and will succeed in doing so if not prevented by the rider. Their caution is great when they apprehend danger in passing over steep places; the instant danger was anticipated, the nose and fore-feet were used to ascertain its extent, which done, the animals cautiously proceeded, and reached the bottom with great care and ease.

When the party had ascended to the fourth or alpine region, they met with sharp and cutting winds, with hail and snow. The lower part of this region was estimated at an elevation of about 15,000 feet. As effects of this elevation, they were oppressed with headache, difficulty of breathing, and excessive lassitude.

"The crest of the Cordilleras is at this place a league in width, the surface very uneven, containing small lakes without outlets, sunk in deep hollows; beyond this the streams which form the extreme sources of the Amazon were running to the eastward."

After travelling two leagues on a gentle descent they reached at Casa Cancha, a muleteer's rendezvous. It was in charge of two women. The accommodation was an apartment common to all, with no fastening to the door or windows, without a fire, and only the hard ground to sleep on.

At night the thermometer frequently falls to the freezing point, and the climate is like that of winter; there is not a stick of wood nor any resinous fuel, as on the Chilian Andes, to be had, and the cooking is done with turf, when it can be obtained, but dry cow-dung is most commonly used for this purpose. This is the only and the best establishment the place affords; even the first females in the country who are bold enough to ascend the Cordilleras, can procure no better accommodations, and will bear it for the night with contentment.

During the night the party were very much troubled with headache and difficulty in breathing; they passed an uncomfortable night on the clay floor. The thermometer in the doorway stood in the morning at 33 deg.

Casa Cancha is in a valley surrounded by lofty mountains. Its height, upon the authority of a gentleman at Lima, is 14,500 feet above the level of the sea.

Pasturage in its vicinity is good; sheep and cattle are abundant: bread and potatoes are brought over the mountains from Obrajillo.

On the morning the party, with one exception, were all affected with vomiting, headache, and fever, and still suffering much from difficulty in breathing; this is usually felt on first visiting these elevated regions, and said to be particularly so at night.

The morning proved so boisterous with frequent hail showers, that they determined to remain the day, to rest their mules and recruit themselves.

As the weather allowed them to botanise, they set out in two parties, but had not been occupied over two hours before they were overtaken by a severe snow-storm, which entirely covered up all small plants.

They started at an early hour, the wild geese were flying and feeding around them. The object was now to proceed to Alparmarca, distant from Casa Cancha about two leagues. Their guides being unacquainted with the paths, led them among the mountains, and over extensive plains, covered with coarse herbage. A variety of beautiful flowers were found, and domesticated llamas were seen feeding.

At Alparmarca are a few huts in the vicinity of a silver-mine, where they found some Peruvian gentlemen, collected from various quarters, who received the United States party with great kindness. They were served in a large gourd-shell with Spanish hotchpotch, or olla, with carrots, pot-garlic, pepper, and small bits of mutton. This repast was well timed, for the party had been fasting for several hours.

Silver Mines of Alparmarca.—The Peruvians showed the process of extracting the silver: the ore is broken up until it resembles earth; it is then thrown into a large round vat, and mixed with mercury and water; six or eight mules are then turned in and driven round and round, until the amalgam is formed; it is then put into a vessel, and stirred with water until the earth mixes with it, and the water being poured off, leaves the amalgam, whence the mercury is finally evaporated.

The ore appears to be taken almost entirely from the surface. It is poor, and the mines do not yield much profit. There are many old veins that have been extensively worked, but owing to their depth have been abandoned.

The superintendent proved to be an English miner (Mr. R. Bevan), who had been twenty years in the country. He informed them that the old Spaniards had worked the mines cheaper than any one has been able to do since. They were large landholders, and contrived to keep themselves in debt to their tenants; this they always paid in manufactured goods, very much in demand with the Indians who worked the mines, thus making a double profit on the wages. At the present time the mines are worked by Indians of mixed blood, who have a language of their own. They are much addicted to the use of coca (the leaf of the erythroxylon coco, which is mixed and masticated with *quinua*), and without a supply of this leaf they will not work.

Mr. Bevan took the party to the mine, which is some distance up the mountains. Much difficulty was experienced in breathing the rarefied atmosphere, and great fatigue in walking; so much so, that it was necessary to stop every few steps to rest; Mr. Bevan, and the Indians who accompanied him, appeared to be more affected than any of the party. He assured them that it was the same even with the Indians born on the spot, showing that neither time nor other circumstances can adapt a constitution to this elevated region. On reaching the mouth of the mine, they saw several emaciated and ghastly-looking Indians seated near the entrance; they descended a few yards into it, but found that time would not admit of the delay necessary to pass down to the places where they were at work.

On no part of their journey did they find so many remarkable plants as on this mountain.

Towards the middle of the afternoon they returned to the hut, when they determined to proceed to Banos.

Along the road they passed some high ridges, with snow and ice coming at times down to the path; also lakes in deep ravines, somewhat resembling small craters, which, like all the rest they had seen, were tenanted by numerous waterfowl.

The crest of the Andes did not appear here quite so broad as it had been found to be four leagues to the southward, but its elevation was thought to be greater. The continuous ranges of snowy peaks in the direction of Pasco were very striking. The Indians have names for the most remarkable ones, but the Spaniards embrace the whole, together with the principal one, under the name of *La Vinda*.

At dark they reached Banos, which is considered to be at about the same elevation as Culnai, but the descent is more rapid to the former. According to the custom of the country, they applied to the alcalde for accommodations, who is obliged, according to law, to furnish travellers with a house, if the town should possess none for the use of strangers, free of expense, and to provide them with a cook; the travellers buy their own provisions, and pay for the cooking, one real for each dish.

Banos is celebrated for its mineral hot-springs, from which it derives its name; they flow from the base of a high mountain.

The town consists of about thirty houses and a church, of which the inhabitants are very proud. It is a neat little village, situated in a deep ravine, by the side of a tumbling stream, bounded on both sides by precipitous mountains 3000 feet high.

Along the margin of the stream, carnations, pinks, stock gillyflowers, and French marigolds grew naturally; the pinks grow in immense numbers in every crack and crevice.

The cabbages here are woody and arborescent, like the cow or tree-cabbage, the trunk and branches being quite hard, and covered with bark.

The thermometer stood at 50 degrees, and the weather, in comparison with the day before, was mild.

The soil in this valley is good, and cultivated in some places with care: no fruit was observed. The largest trees were a species of elder and a buddlea; calceolaria, salvia, and heliotropium abounded.

At an early hour in the morning the villages or huts of this pasture region are deserted by the inhabitants, who go forth to tend their herds.

The houses in these villages contained no other articles of furniture than some roughly-made wooden spoons, earthen dishes, and water-jugs, a few boards made into a rough table, with a stool or two, and a bedstead made of canes, and plastered with clay. In no part of the United States, whether in the cabins of the far west, or in the poorest suburbs of the eastern cities, are persons to be seen living in such a miserable manner. The country people of Peru, notwithstanding they are surrounded with every thing to make them comfortable, want the knowledge and industry to use the advantages nature has given them.

On the party returning to Culnai, the villagers were busy gathering in their potatoes. There were also several patches of oxaliscunata, tropæolum, tuberosum and a species of basella; all of them are eaten by the natives. These patches are enclosed by low stone dikes; the plants, as they grow, are earthed up as potatoes are in Europe and the United States; irrigation is necessary, as the soil is light and open, and consists chiefly of decayed rock and vegetable mould.

Culnai and Banos are about on the same level, 10,000 feet above the sea, and are the highest points of cultivation; they are both distant from the crest, by the route of the streams, about nine miles.

At Obrajillo good crops of Indian corn, rye, and beans are raised; but none of these grow at a greater altitude.

The party saw in the morning a town officer strutting with a spear about the public square, calling all the women out to come and sweep it. They soon made their appearance, and were not long in creating a prodigious dust. They swept the dirt up into small heaps, then taking their coarse shawls from their shoulders, they spread them upon the ground, and put the dirt they had collected into them to be carried away.

On settling with the guides at this place, they requested their money might be kept for them until they reached Lima, as they certainly would be robbed if they took it themselves. This proves how little security there is for persons having any thing valuable about them in this country.

The frequency of murder, highway robbery, and a constant resort to the *cuchillo*, has not been exaggerated in the accounts of Lower Peru.

The guides, knowing well the dangers to be apprehended, showed much solicitude about keeping the company together.

They reached *Yanga* without accident, and finding the posada occupied by a party of soldiers and a recruiting officer, they were directed to a house with a porch, but they found it shut up. Soon after a woman appeared, and on being informed of their situation, and that they had fasted for two days, she set about providing for their supper. She proved to be the owner of the estate, was somewhat advanced in life, managed her own affairs, and was seemingly well adapted to encounter the roughness of the times. The heiress, a little girl, came galloping on a horse, driving the cattle before her with the air of a veteran, having command over both the animal she rode and those she drove; they were not much struck with her beauty, for her well-plastered face, and wide-spreading and matted hair, gave her the appearance of an elf; but she was a specimen of Peruvian nobility. Their supper was good, and they were permitted to lie on the clay floor in the house.

They paid the usual price for the accommodations. In the morning, before their departure, they purchased fifty oranges for twelve and a half cents (a real), it being stipulated, however, that they should be gathered by themselves. These served to refresh them while passing over the barren track (described in their ascent) of four leagues.

Monotonous Vegetation.—The great difference of elevation, and the variation in climate consequent thereon, would lead one to expect a greater variety in the vegetation, than was actually found. Forests were nowhere met with, nor were any of the palm tribe seen; very few of the many tropical plants were perceived even on the coast of Peru. The smaller shrubs were seldom found, except in the lower region, where their limit is circumscribed to the well-watered district. Thickets are very rare, and in the higher regions appear to be altogether wanting. The vegetation of Peru, on the whole, is characterised by an air of tameness, indicating but a slight change of season, and has been classed into four distinct botanical regions, which are easily distinguished.

Geology of Peru.—The geological structure of the region passed over by the exploring party, as far as their observations went, corresponds to that of North Chile, with the exception of a narrow belt of sedimentary rocks along the sea-coast, west of the granitic range, which is wanting in that country. This belt includes the island of San Lorenzo and others, as well as the coast itself, to the extent of from seven to ten miles from the sea-beach. These sedimentary rocks are argillaceous, distinctly stratified, and more or less slaty, the layers being in many places discoloured by the red oxide of iron. In other places they appeared of a black colour, as if in the vicinity of coal-beds, of which the existence was spoken of, but they did not discover any unequivocal traces of this substance. Some conspicuous examples of faults were noticed by Mr. Dana along the coast of San Lorenzo. Many minerals were also found by this gentleman; among them gypsum was of frequent occurrence, as well

as some fossils: for fuller information reference is made to the Geological Report.

The hills and mountains to the eastward, joining the above sedimentary rocks, are exclusively of granite, which extends in width to the distance of forty-five geographical miles beyond Yaso. In places it has very much the appearance of a stratified rock: it is much broken, and variable in its character, so as to render it somewhat deceptive. Dr. Pickering observes,—

“That this peculiar character or appearance is owing to the slow process of the decomposition of the rock in this dry climate, and which would, in other places, subject to the ordinary fluctuations of seasons, be covered with several feet of earth. The same reasons will account for the duration of the Inca villages that cover many of the hills, and which a copious shower would entirely wash away. The granite on its eastern side was coarse-grained, presenting more of the ordinary appearance of that rock.”

Immediately eastward of the granite district commence the trap rocks, consisting for the most part of porphyry. Dr. Pickering traced the line of junction for some miles: the hills on one side being of granite, on the other porphyry. The eastern limit of the trap region is supposed to be distant some twenty miles from the western. The porphyry resembles the Swedish, and that in the vicinity of Boston, New England. Many porphyry pebbles, supposed to be of this formation, were found on the beach at Callao, having, it is to be presumed, been carried there by the water-courses.

Next comes the plateau of the Cordilleras, which is formed of sedimentary rocks; this includes the silver-mines, and the highest peaks, and is apparently of the same age as the coast. Much of the rock is argillaceous. At Banos, an argillaceous limestone was used for burning, and quantities of gypsum, used for manure, was brought from the vicinity of Casa Caucha, some twenty miles to the north. Conglomerates prevailed over a great portion of the crest the party traversed. The pebbles included of regular shape, smooth and polished as if sea-washed. The smoothness of the pebbles in the torrents of the Cordilleras had a strong resemblance to those on the sea-beach.—*United States Exploring Expedition.*

The bare spots of the higher peaks did not present the variety of colour of the Chilian Andes, but had a uniform dark, slaty hue. Gypsum incrustations were seen forming on the rocks and plants.

Obrajillo, Canta, and some other valleys in Peru, extend from the sea-coast to the Cordillera: some only descend a few leagues rapidly from the *puna* or lofty table-land, others sink into deep ravines in the Central Andes, or under the face of the Montana.

The great region between the gigantic mountains, Andes, and western or Cordillera range, comprises extensive table-lands yielding short, fine grass and hilly pastures, which, Dr. Smith says, is “very like in general outline to the Highlands of Scotland, though destitute of heath.” This region is watered by lagoons and intersected by rivers and temperate or warm valleys, the soil and

climate of which yield the richest fruits, while the summits of the hills and mountains are cold and barren. Dr. Smith says,—

"From one of these glens, where we once resided for some time, we left a house at the door of which the lemon-tree was in perpetual fruit and blossom, and in two or three hours thereafter arrived at the rugged crags and peaks of the eastern Cordillera."

The roads or routes from the western coast to the Central Andes wind along narrow glens and ravines, faced by lofty mountains or rocks.

"Many of the mountain roads," says Dr. Smith, "as they leave the bottom of the glens, and ascend, in more or less of a *caracole*, along the face of formidable steepes, seem to bear date of origin from the *Quichoa* era, when the llama was the only beast of burden in the country. These animals, like their Indian owners, delight most in the cool of the hills; but, when laden and on the road, their slow and stately gait must not be hurried or interfered with, nor their burden increased beyond their liking, which seldom exceeds seventy or eighty pounds weight on a long journey: the Indian understands their way, and rules them by gentleness. As the llamas are not for forced marches, and only make short stages of three or four leagues daily, the paths that lead through the pasture-grounds are the best suited for them.

"There are places where there would be danger, on meeting an impatient animal or careless horseman, that either party would be hurled over the brink, and consigned to the condors and eaglets that nestle on the cliffs and in the dark chasms of the crags.

"Such dangerous passes are at some places so contracted that the stirrup of the muleteer is seen to overhang the foaming stream, or project beyond the verge of the boldest precipice; and every now and then they are made more formidable by abrupt angles and insecure breast-work without parapets, hastily constructed when the rush of a sudden torrent from the hollow of a hill, or large stones rolling from the heights, have cleft the way so as to render it for a time impassable.

"There are also many *cuestas* or rapid steepes, with here and there flights of steps, roughly cut in the hard rock. By the wayside, in tedious *cuestas* of several leagues in extent, recesses are, in numerous instances, worked out on the higher side of the road, which serve for the passengers to draw up, while those from an opposite direction are allowed to pass on, or where muleteers stop their cattle to adjust their cargoes and tighten their lassos. But when a rock or shoulder of a cliff juts out from the road towards the lower or precipice side, leaving more or less room for a resting-place, then the little flat space is coarsely walled in with large fragments of rock and such smaller stones as may be at hand, giving the idea of a rude but commanding fortress.

"The famous *Cuesta* of Sap Mateo, on the Tarma road from Lima, we passed in the year 1834, and could not but wonder how, without any very serious accident, an army of cavalry had been able to pass the same route a few months before, when the path and staircases were yet wet and slippery from occasional showers.

"The *Indian's eyrie* on the summit of some steep and lofty mountain (seldom visited by a white man, save the curate), may be easily passed many times unnoticed by a stranger, who may never be led to suspect its existence, unless he meets a swift-footed Indian, closely followed by a person on a well-accounted and elegant mule, whose gear," says Dr. Smith, "is all laden with silver ornaments; and the rider, who sits at his ease in a saddle of the country with a rich pellen, wears a large-brimmed hat, with a black silk cap emerging to view at the ears and temples. He has on at least a couple of ponchos (mantles) well-decorated and fringed; his black or brown stockings are of warm Vicuna wool; and the heel of a small shoe, half-concealed in a clumsy and costly, though wooden stirrup, is armed with a prodigiously disproportioned silver spur, with a large tinkling roller, used to keep his noble animal in mind that she is but the harbinger of death, and carries on her back the keeper of the sinner's conscience.

"This minister of peace to the miserable hurries to save the soul of a dying Christian, whose abode, like the falcon's, overlooks the ordinary path of wayfaring men; and which, when descried, seems, to the sight of an observer underneath, to be indeed the loftiest earthly point between the ground he himself stands upon and that heaven for which, it

is believed, the anxious and fluttering spirit of the gasping Indian only waits the curate's absolution and blessing to wing its immortal flight. It occurs to us here to remark, that in the remote curacies of the hills no friars are to be seen, as on the coast or more genial climates; an important part of whose duty it is, wherever they locate themselves, to aid the Christian to die well, and to watch by his pillow, and exhort and comfort him, while the crucifix and taper are ever before his eyes, and the breath of life about to leave his animal frame."

From Lima to the Cerro de Pasco a rider, on a good horse, will arrive in four days without injury to himself or beast, and this is considered good work; but we have known the journey from the Cerro to Lima performed in about fifty hours: this again is a work of over-exertion for the man, who is very likely to incapacitate one or perhaps two animals in the undertaking. It may be said, in general, that on a rough and hilly road a league an hour is a fair rate of travelling for a fresh beast on any ordinary journey in the interior of Peru.

The arrieros with cargoes usually take nine or ten days, and sometimes more, from Lima to Pasco, as they make short stages, consulting the ease of their cattle and convenience of lucern or pasture; and at Obrajillo they commonly rest a day at least, to refresh or perhaps relay some of their cattle, before they proceed to brave the toils of the Cordillera.

Bridges.—When the aboriginal race had to pass any river, their engineers supplied, as best they could, the wants of science by natural sagacity. They constructed a simple bridge near the outlet of a stream whence it happened to flow; as is seen at the Lakes of Lauricocha and Pomacocha. The bridge was built by laying down large stones at short intervals from bank to bank; and when piled above the surface of the water, they served as abutments or supporters, over which were laid transversely large flags, which formed an even and safe passage for men and cattle. These abutments, too wide apart for stepping-stones, are still to be seen firm in their places, though the transverse flags are no longer found, at least at Pomacocha.

The swing or sogá bridge, of ancient invention, is still used in Peru. It is made by ropes twined from the pliable *bejuco*, twigs of willow, or any other flexible and vegetable filaments; and these are well secured at the ends on the opposite banks of the water: on these, bundles of maguey leaves, broom, or other long shrubs, are laid crosswise, and bound closely and firmly by ligaments or slips of the maguey leaf ("cabuia"). This kind of bridge is made of sufficient breadth for foot-passengers; and a hand-rope runs along each side, by which the traveller can steady himself while walking over. A good specimen of this kind is the *sogá bridge* of modern Huanuco. At Oroya, over the River Jauja, there is one strong enough for cargo-mules to cross upon. The ropes are made of bullock's hide, and extend from bank to bank; the cross-bars are squared pieces of wood bound down with thongs, and broad enough to allow the animal to pass. For passing the lakes and rivers of the Andes, the "balsa," a small canoe made of rushes, is used.

Aqueducts.—The aqueducts of the ancient Peruvians are still traced along the chasms of rocks and sides of arid eminences in the vicinity of the coast, and in the dry intermediate valleys. These ruined aqueducts sometimes appear among the most rugged crags, and in some places are elevated to a remarkable elevation.

Dr. Smith says,—

“One of the most striking of these aqueducts is about eight leagues from Lima, on the low road to Alcacota by Caballeros, on a high rocky acclivity, along the base of which runs the road, close by the winding of the River Chillon or Carabaillo, which descends from the Cordillera, by Obrajillo. It is also very usual in the temperate valleys, where the hills are flanked with soil, and clothed in vegetation, to meet here and there the ruins of small villages with files of successively rising platforms on the hollow side of a hill. These tiers of artificial flats, or gardens, are generally only a few yards in breadth; but in length greater or less, in proportion to the dimensions of the semicircular sweep of the recess capable of cultivation.”

Hanging Gardens.—Between the cliffs in the neighbourhood of Culnai, may be seen samples of those tiers of gardens, built up one above the other on the face of the acclivity.

In constructing these gardens one above the other, the aborigines must have begun by erecting a stone wall on the lower part of the slope, or more even ground, that formed the base of the series; and, as it was in process of rising to the desired height, the earth must have been scraped down from the side of the acclivity, to fill up the space thus partitioned off into a level bank or platform: then, behind this first level was raised another stony partition, and more earth again scraped down; and so on successively, till the uppermost and last tier of these little and tasteful gardens was completed.*

By such means the natives always preserved deep soil, which they dug up at pleasure, bringing a new surface of earth to yield a new crop without manure, and by the same contrivance they preserved from the washings of the frequent and heavy rains, the vegetable loam which they thus so laboriously collected.

On descending from the inner regions of the country, among the arid and naked granite mountains near the coast, the ruins of Pagan dwellings show themselves in the crevices of the rocks, where no plant is seen on the waste land, save a few scattered cacti, and no moving creature except the lizard that basks, and the kite that waits its motions, on the crumbling ruins and circumjacent blocks, which have been rolled from their original seats on the face of the steep. Nearer the capital, the vale of Rimac unfolds its wide and fertile deep alluvial soil, but which if not irrigated presents a sterile desert. It only requires irrigation—and no manure—to yield sugar-cane, and to send forth lucern and Indian corn in luxuriance.

* The Indian gardens on the hills of the Sierra are by the Spaniards called *Andenes*, whence Andes.

CHAPTER XVIII.

MINERALS.

THE mineral riches of the Montaña, especially in silver extracted, is very great; but many of the mines are abandoned. Those of Pasco are considered the richest mines now worked in South America; they formerly produced eight million of dollars, or 1,800,000*l.* annually. The mines of Gualgayoc, towards the northern boundary of the republic, are also rich. At Huancabelica there are quicksilver mines, which were formerly productive; gold dust, and in pieces, occurs in several rivers; copper, iron, lead, and sulphur are also found. Nitrate of soda is gathered in the Valles as an article of export. Salt is prepared along the Pacific, especially at Salimus, near Callao, in Sechura Bay, rock-salt in the interior of Montaña.

PLAIN OF SAN JUAN AND MINING REGION OF PASCO.—The town of Pasco, situated at an elevation of 13,000 feet, in the plain of San Juan, near the head of two ravines, one Rumiallana, leading to the northward, the other Huanuco, to the eastward. It has the beautiful Lake of Chinchaicoca, near old Pasco on the south. Herds of cattle and flocks of sheep feed on the brows of the hills; the tame llama and the shy vecuna are also seen; geese, ducks, snipes, plovers, water-hens, flamingoes, and other birds abound on or near the waters. The climate for at least half the year is gloomy and cold.

The ground that has been broken up, and in which ores have been found, is about half a mile in length, in a north and south direction, and about one-fourth of a mile east and west. Within the whole of this extent ores have been mined of greater or less value, and the mines formerly worked, and now deserted, are said to amount to upwards of a thousand.

Pasco is surrounded, north-east and south, by hills of blue limestone; on the west by hills of sandstone; and on the south-west by hills of a blue slate. All the ores of the Cerro are ferruginous, and the silver nearest to the surface is contained in an *ochreous iron-stone*. In some places the silver is mixed with lead and copper, and at variable depths; the ores rest on a bed of solid iron pyrites, which in some mines yield silver.

The plain of San Juan on the north is divided into many mining districts, to which names are given to distinguish them more readily. The southernmost of these, Zauricocha, contains several mines, from which the greatest quantity of silver has been produced since the revolution.

In the district of Santa Rosa, west of Zauricocha, a greater quantity of ore has been raised.

On the east of the Zauricocha is the district called Aranillapata, in which few mines are now worked; the ore, although abundant, is not rich.

Cayac, another district lying north of Zauricocha, is worked to some profit; and several mines in it have been yielding good returns.

To the north of Cayac are the Chucarillo and Zauracancha districts, the working of the mines in which had been impeded by water.

To the north of these last two districts lies the plain of San Juan; there are a few small veins running through some parts of it, but no important discovery has yet been made, although many mines have been opened and carried down to the depths of 120 to 150 feet.

The whole number of mines considered rich in the different districts of Pasco may be enumerated as follows :

Zauricocha.....	12 to 14
Santa Rosa	20 „ 25
Cayac	10 „ 12
Chucarillo	5 „ 6
Zauracancha	10 „ 12

Each of these mines comprises a space of 180 feet long by 90 feet wide.

The silver ores are estimated by a measure called a box of ore, which contains twenty-five mule loads of ten arrobas, or twenty-five pounds each. Each box varies in value from six Spanish marcs to 3000; the former being the lowest which, under the most favourable circumstances, will pay the cost of working.

The miner who raises ores in considerable quantities, which will give ten to twelve marcs per box, is considered to work profitably.

The produce of these mines since the close of the revolutionary war, has amounted to the following quantities :

Y E A R S.	Silver.	Weight.	Y E A R S.	Silver.	Weight.
	bars.	marcs. oz.		bars.	marcs. oz.
1825.....	228	56,971 6	1833.....	1133	256,333 2
1826.....	818	163,852	1834.....	1142	267,363 4
1827.....	1068	221,707 7	1835.....	1148	276,813 2
1828.....	922	201,338	1836.....	991	244,404 1
1829.....	359	82,031	1837.....	1972	234,785 3
1830.....	457	96,265	1838.....	1172	248,022 6
1831.....	635	135,139 3	1839.....	1210	279,260 3
1832.....	994	219,380 5			

Shopkeepers and dealers in *plata-pina* are tempted to lend money to needy mine-owners, to be repaid in *pina** at so much per marc. Such a lender is called “habilitador;” but, by the custom and usage of the miner, the last “habilitador” has a claim to be first paid, which leads to the worst practical results.

The establishment for grinding and amalgamating the ores are situated at

* *Plata-pina*, or simply *pina*, is the name given to silver not entirely purified from the mercury which adheres to it in the process of amalgamation. Amalgamation is effected by mixing the ore, after it has been ground, with salt and quicksilver; treading the whole together by men or cattle; then allowing it to repose in *cerco*, or in the enclosure in which it has been trodden, for a month or six weeks. At the expiration of this time the quicksilver is supposed to have combined with all the silver in the mass, and to have formed a perfect amalgam, called *pella*, which is separated by washing away the mud and refuse of the ore. The *pella* thus obtained is white, and so liquid that, by putting it into a strong bag, a considerable quantity of the mercury is made, by pressure, to escape, leaving the amalgam solid. It is decomposed by a red heat; and the mercury being distilled, it may again be applied to the same purpose as before. In the process there is usually great waste of quicksilver, on account of the bad apparatus employed; and the fixed metal or silver which remains is what is called *pina*. This *pina* is usually sold by the miner in round masses larger than cannon-balls; and these balls of silver are, by the trader who does not venture on smuggling, carried to the government smelter stationed at the mines, by whom they are melted down, purified, and cast into bars, which are stamped as the *ley* or standard purity: after which they are carried to the mint to be coined.

from one mile to three leagues from the mines : those nearest the town are deficient in water for several months in the year. The construction of all these mills is rude, and much power is lost.

The consumption of mercury, including mechanical and chemical loss, is about one pound for each marc of silver produced.

No attempts have been made at roasting any of the ores.

Coal mines are met with in various parts of the country, at the distance of from two to seven leagues ; the price is one real for an arroba, but might be much reduced if the business were properly attended to.

Speculation is always rife in search of these valuable ores, and prospects of great gain are invariably held out to those who engage in them ; but there is much difficulty in getting the business into successful operation. *The great error committed by all the English companies established in 1825, for working mines in Spanish America, was in saddling themselves with numbers of people, engaged at high salaries, and workmen at extravagant wages : the expenses attending this force swallowed up much of the funds before any work was begun.* These included not only inspectors and mining captains, but artisans, all of whom were sent from England. From a total change of life and circumstances, the mining captains and artisans almost invariably turned out in a short time drunkards, and became good for nothing. In some cases miners were brought out, and these turned out still more worthless than either of the two former classes. They, indeed, did more work than the Indians, but their wages were higher, and the expenses for their importation in addition made them cost much more.

The silver yielded in this department must, according to law, be sent to the government assay office to be melted into bars, and thence to the mint at Lima to be coined. The usual price of silver as it comes from the mine, is from seven dollars six reals, to seven dollars seven reals per marc. If remitted to Lima on account of the miner, it yields him about eight dollars one real per marc.

CHAPTER XIX.

C L I M A T E.

IN the Valles of Peru rain seldom or never falls. There are heavy dews ; for six months in the year the interior of the Montaña is subject to heavy daily showers, during the rainy season rains fall in torrents over the plains. In the Valles there are fogs, called *garua*. In the Montaña there is great cold on the sides and tops of the mountains, and excessive heat in the deep valleys. The plains are unhealthy, excessive heat causes pestilential vapours to arise from the stagnant waters. Generally speaking, the climate of Peru is far less salubrious than would be supposed from external appearances. Dr. Smith, who lived in the country, and who made its maladies and its climate his special study, says,

the temperature of the low valleys on the coast of Peru may be said not generally to exceed 82 deg. Fahrenheit in summer, nor lower than 60 deg. in winter. Pauza, the most northern province of Peru, has an almost perpetually dry atmosphere. When rain happens to fall—which is rare—grass and vegetables suddenly spring up on the fields of sand. As to the temperature generally of the sea-coast region, Dr. Smith observes,

“That where high hills overhang the sandy plains, or dry ‘pampas,’ it is difficult to say to what degree the thermometer may fall during night, when the rush of cold air from the upper regions is in proportion to the degree of radiation from the plains, and the force with which the sun’s rays during the day had struck on the scorched ground. So intensely on such occasions does the traveller feel the transition, that, when benighted on desert places, he is sometimes compelled by the keenness of the cold to dismount, and bury himself up to the neck in the warm sand, until a returning sun again befriend him on the morrow, and encourage him to pursue his trackless way.

“In Lima, the capital of Peru, neither the extremes of heat nor of cold are ever experienced; an advantage which it partly owes to its very splendid back-ground of mountains, rising one above another to the skies.

“On one occasion, when we observed the barometer fall from $29\frac{9}{10}$ to $29\frac{1}{2}$ inches, there had been a smart earthquake, which, though it happened in the usually dry month of January, was preceded by a gentle shower of rain, at the appearance of which the people in the streets rejoiced, and called it ‘*agua bendita*!’—holy water! On another occasion, when we noticed a similar sinking of the mercury, the River Rimac showed, by its turbid and swollen stream, that it rained heavily in the higher mountains. As for thunder and lightning, they have been so rarely witnessed in Lima, that there they may be said to be unknown. The above statements regarding the state of the atmosphere in Lima, it may be proper to mention, are founded on observations made by the writer at his residence in Archbishop’s-street, close to the cathedral and great square; but about a mile higher up, in a part of the city called the ‘Cercado,’ the influence of the adjacent hills is more sensibly felt in the cooler evenings and mornings; the night thermometer sometimes sinks down to 54 deg. at the orchards of the Cercado, when in the centre of the city it falls within an open window or veranda not under 60 deg. of Fahrenheit.”—*Smith’s Peru*.

In Lima the seasons are usually distinguished as spring, summer, autumn, and winter, but the usual division of the aborigines, into wet and dry, are the true distinctions.

“In May the mornings become damp and hazy; and, from the beginning to the latter end of June, more or less drizzly. In October, again, the rains, which even in the months of July and August are seldom heavier than a Scotch mist, cannot be said to be altogether over, as the days are still more or less wet, or occasionally there may be seen to fall a light passing shower; the evenings and mornings being damp and foggy.

“In November and December, when the dry season may be reckoned to have set in, the weather, except for an interval at noon, is for the most part cool, bracing, and delightful: and April, too, is in this respect an agreeable month; at the latter end of which, the natives of the capital, being so exceedingly sensitive as to feel a difference of only two or three degrees betwixt the temperature of two succeeding days like an entire change of climate, are admonished, by a disagreeable change in their sensations, to protect themselves by warm apparel against the chills arising from an occasional north-west, or from the influence of the common south-west wind.

“Throughout summer the wind blows almost uniformly, and in gentle breezes, from the south; but the prevailing wind for nine months in the year is the south-west, which, as it mingles with the warmer air along the arid coasts of Peru, tends to moderate the temperature of the atmosphere, and to produce the fog and ‘garua,’ or thick Scotch mists, of which we have taken notice. During the dry season on the coast, the rains are experienced in the interior of the country and lofty range of the high table-lands;

especially in the months of January, February, and March, when the rain that falls inland is often very heavy, and, on the most elevated regions, it is not unfrequently alternated with snow and hail. Thus, the dry season of the coast is the wet in the sierra, or mountain land, and *vice versa*; and by merely ascending higher to the sierra, or descending close to the sea, without any appreciable shifting of latitude, the favoured Peruvians may enjoy, by the short migration of a few leagues, a perpetual summer or an endless winter; if that, indeed, should be called winter, which is the season of natural growth and herbage."*—*Smith's Peru*.

By the end of September, which is the beginning of *spring*, the trees in the great avenues around Lima begin to bud; and the leaves expand, as the grass fades on the adjacent hills. As soon as the natural vegetation on the neighbouring heights, and nearer ridges and declivities in view of the city, withers, the irrigated fields and enclosures send forth verdant agricultural crops.

Barley, peas, and maize, sown during the wet or misty season, come to maturity through the action of sun and artificial moisture, after all natural or spontaneous vegetation has withered and disappeared from the arid hills and sandy downs. The maize crops are always harvested in the "*menguante*," or decrease of the moon. Every cultivator believes, that if he collects the crop in the "*creciente*," or increase of the moon, it will not keep free of moths or mould for three months, even if left in the husk, in which state it is least liable to damage.

In the valleys around Lima the agriculturist will not sow in the "*creciente*," lest the seed should not yield a healthy crop. The same attention is observed by the wood-cutter, who considers that timber cut in the "*creciente*" soon decays. Mr. Smith says,

"Being disinclined to believe what he considered to be the prejudices of the natives respecting lunar influence, he insisted upon roofing in part of a house with alder and willow cut in the '*creciente*;' and after a couple of years he was convinced of his own error, when he saw the timber employed become quite brittle and useless."

The "*arriero*," or muleteer, scrupulously observes the influence of the moon on his cattle. If he travels in the "*creciente*," he will not unsaddle his horses, nor *unpad* his cargo-mules, until they have rested and cooled. He asserts that, if he should neglect these precautions, he would be sure to have his cattle disabled by large inflammatory swellings, rapidly running on to suppuration, forming on their shoulders or loins.

The "*chalan*," or horse-jobber, will not be prevailed upon to cut the lampas from a horse's gums; nor will a citizen of Lima, at any time, except in the "*menguante*," pare his own corns, for fear of inducing severe irritation. From

* "Late in August, or early in September, *Buena Vista*, in the enchanting vale of Lorin, six or seven leagues south of Lima, when the sandy downs, yet moistened by slight rains and vapours, and garnished with flowers, such of the trees in the vale as are not evergreen, and depend not, like the vegetation of the neighbouring heights, on the periodical rain of the coast, impart a certain melancholy hue to the landscape, as they have already commenced to shed abroad their sear foliage; and here the music of the thicket, and booth on the height, are both in unison with feelings inspired by the yellow-leaved willows, when the '*lomero*,' or herdsman of the downs, tunes the '*yaravi*,' a mournful Indian strain, on his homely lute, and when the *cuculi*, in a plaintive note, responds from the guarango grove."—*Smith's Peru*.

all these facts, lunar influence is considered very remarkable in Peru, both in respect to the animal and vegetable kingdom.

There certainly appears to be something peculiarly enervating in the atmosphere of Lima. According to Dr. Smith and others, the dog species becomes sluggish and spiritless, and more disposed to bark than to bite; and it shows itself in its influence on the male descendants of unmixed European parentage. The sons of the old brave and stately Spaniard dwindle away into effeminacy.

Dr. Smith observes,

“If the mildness of contagious epidemic diseases were to afford a fair test by which to judge of the climate of any particular locality, or the medical police of its community, that of Lima would surely rank as one of the most favourable. But, however open and spacious be the construction of the houses and site of this capital, and whatever may be said for, or against, the personal and domestic cleanliness of its inhabitants, and other circumstances affecting the health of individuals, it must be admitted that the salubrity of Lima, and the chances of life it affords, are materially diminished from the want of due attention to public cleanliness.”

The aqueducts or canals, which run along the principal streets from east to west, and give off branches for gardens and convents, &c., are, after they have passed the city, to some extent usefully distributed on fields between it and the seaport. But, in general, agriculture, like every other branch of industry, is neglected since the revolution. The drains intended to convey the surplus water from the city over a gentle slope, to impart moisture to the good soil which could not otherwise part with its nutritive properties, or support vegetation, are frequently in a ruinous condition. Thus, the water is suffered to stagnate in some parts, and run waste in others, without being applied to those purposes of tillage which should be the means of augmenting the health, population, and general resources of Lima and its environs. By the street-canals, are to be seen all day long vultures (by far the most efficient agents of police), gulping up the refuse cast into these receptacles of every sort of nuisance. When the water runs in small quantity, or is altogether stopped from neglect, the quantity of vegetable and animal deposit carelessly allowed to accumulate in these channels emits gaseous volatile poison, more or less penetrating and pernicious, according to the season of the year and heat of the weather.

The manure conveyed from the pens and stables, when not thrown into the canals, is conveyed to the broad walls of the city, and there heaped up day after day; or, if not thus disposed of, it is carried to the river's brink, where it is suffered to accumulate into fermenting mounds, daily increasing in size. Here it absorbs moisture, and generates miasmata. Culpable inattention to the cleanliness and salubrity of the capital has contributed largely to entail upon them a greater proportion of disease and mortality than could be expected from the climate. Those natives, indeed, who have passed a life of well-regulated habits, are said to attain a cheerful old age in Lima; and there are instances

of a few individuals exceeding a hundred years of age, who preserve considerable bodily activity and mental vivacity.

NUMBER of Deaths in Lima and its Suburbs, from the Year 1826 to the Year 1835, both inclusive, taken from a careful Examination of the Register-Books belonging to the Pantheon, or Public Cemetery at Lima.

Y E A R S.	Deaths.	Y E A R S.	Deaths.	Total Number of Deaths in the preceding Ten Years.
	number.		number.	number.
1826.....	2075	1831.....	1871	23,508
1827.....	2162	1832.....	2576	
1828.....	2106	1833.....	3305	
1829.....	1948	1834.....	2741	
1830.....	2118	1835.....	2603	

The capital of Lima comprehends within its walls, huts and cottages, contiguous to the city gates, and suburbs of San Lazaro, 54,098 persons of all sexes, castes, states, and conditions, which are distinguished minutely in the same statement, of which the total amount consists of 27,545 males, and 26,553 females.

Mr. Smith, speaking of the climate of Peru and of the high region which he visited, observes,

“ From Yanga to Huaramayo, the glen through which lies the road to Cerro Pasco by Canta is extremely narrow and confined, except at Santa Rosa, where it is somewhat more open. The way often recedes from, though it is generally in sight of, the bed of the river; and is bound in on each side by lofty and sterile granite mountains, which, on the left side of the river as we ascend, are frequently intersected with narrow, perpendicular veins, that arise from the level of the water to the very summit of the mountain, and, from the road, present a ferruginous appearance. It is only by continued irrigation that the few patches and strips of soil throw forth their vegetable luxuriance.

“ At Huaramayo the temperature is intermediate between that of the Sierra and the coast; and, as in the warm inland valleys in the centre of the Andes, so here, in a region of corresponding benignancy on the western acclivity of the same great mountain pile, we have the tree called molle, or mulli, in abundance along the river's edge. This tree is much prized as fuel; and the sugar-refiners of the interior use the ashes from it, in preference to those from any other wood, on account of their higher alkaline properties, and consequent efficiency in purifying the cane-juice while being boiled down to a proper consistence to be cast in moulds.”*

* “The Inca nation,” as we learn from Garcilaso de la Vega (see “*Commentarios Reales de los Incas*,” lib. viii. cap. xii.), “made a highly valued and medicinal beer, which some of the Indians of the interior still occasionally prepare, from the clusters of small-grained fruit that hang gracefully and abundantly from this pretty tree. We have said that the climate here corresponds to that of the warm central valleys of the Andes; but though analogous in several respects, yet there is this marked difference, that at Huaramayo, and other headlands like Huaramayo, as, for example, Surco, on the San Mateo route to the Sierra from Lima, there is neither winter nor summer, but one perpetual spring. It does not rain here for several months in the year, as in the more inland vales; but it agrees with them in being out of the sphere of frosts, and exempted from the raw fogs and sultry heat of the coast. At Surco, Huaramayo, and other similar localities in narrow glens extending from the coast to the Cordilleras, the sun appears to rise late, and to set early, for it is only for a few hours in the middle of the day that it shines strongly between the perpendicular and lofty hills of the valley; and the mid-day heat, arising from the powerful reflection of the sun's rays on the bare rocks, is succeeded by a cool and agreeable evening. Here then the atmospheric currents of mountains and coast meet and neutralise each other,—the extremes of both disappear: and the result is a delicious climate for the convalescent. With this important fact the delicate inhabitants of Lima are perfectly acquainted, and they are accustomed to resort to the cabezadas, or headlands of valleys, where these verge on the joint air of moun-

Captain Wilkes, of the United States Exploring Expedition, observes, "that were it not for irrigation from the mountain streams, a great part of Peru would become a desert. Indeed, the upland is so now. Though dry, the atmosphere is far from clear. Father Truillo, more than a century ago, recorded that the heavens were generally obscured. Captain Wilkes says, although a glimpse of the sun was usually had some time in the day, yet it was almost as difficult to get an observation of the sun as in Terra del Fuego. The dew *almozo* of Lima is never so great as to produce running water; yet it is more like rain than a Scottish mist." He accounts for the aridity of the high Cordilleras of Chili, as well as for the existence of the Desert of Acama, the want of rain on the coast of Peru, and the moisture of the high Cordilleras of Peru, to the fact that the cold dry winds from the southward, sweeping over the western, are great absorbents of moisture. On reaching about latitude 12 deg. south, they cease from being saturated, and on reaching to a sufficient height, are condensed by the cold, and fall on the mountain regions in almost constant rain. He further observes, fire is not used often in Lima, but that there is a "cold clammy feeling, that is exceedingly uncomfortable and prejudicial to health. Lima has the reputation of being healthy, but it does not deserve it." The interments have annually averaged over 3500, in a population not exceeding 45,000. Many of these are those of strangers, and the climate has always been fatal to the Indians.

tains and coast; as, for example, Matucana, the favourite resting-place of phthisical and hæmoptic individuals."

Close to Huaramayo, and by the old line of road, begin the steep ascents called the Paxaron, from the number of paroquets always seen about this place. The path is narrow, fatiguing, and precipitous, to near the village of Obrajillo, a distance of several leagues. On the airy hill-tops, that overlook this way and the ravine below it, are several villages, which are only to be approached by a zigzag and arduous track; and here the traveller passes over scenery which terrifies those who are unaccustomed to the ruggedness of alpine regions.

Canta and Obrajillo are situated in the same opening among the mountains: the latter is entirely the residence of muleteers, whose strong and active women share in the labours of the field; while Canta, on an eminence, is a provincial town, and the seat of a governorship.

The village of Obrajillo is built in a sort of irregular hollow near the bed of a small river, surrounded by arable hills receding and expanding as they rise towards the loftier summits, and therefore affording better ventilation than is to be found in any part of the valley between this and Yanga.

Canta is considered a sort of hospital for the invalides of Lima. In a medical point of view, Dr. Smith considers it invested with a great deal of interest. It is built on a hill whose base skirts the village of Obrajillo; while from the plaza of the lower village to the higher town, the ascent is no more than about thirty minutes' walk. Canta is also considered to enjoy a far purer air than Obrajillo. The inhabitants of Obrajillo and Canta cultivate alfalfa, or lucern, everywhere near the river, and in little enclosures, the surrounding hills are covered with pasture: the lower declivities and slopes produce wheat, beans, potatoes, maize, &c.

Of the leaves of the *culen*, one of the most common shrubs, the natives make a tea which is deemed an excellent stomachic. During the wet season flowers and flowering shrubs shoot forth with liberal profusion; but there is little wood to supply the inhabitants. Stone or adobe walls, with *thatched roofs*, are the buildings of the small villages or pueblos of the Sierra of Obrajillo. These dwellings are the receptacles of potatoes, maize, and other eatables. When the family retire to sleep, most of them lie down on sheepskins wherever they can find room.

CHAPTER XX.

POPULATION.

THE inhabitants are Creoles, or other descendants of Spaniards, Mestizoes, and a few negroes and mulattoes, but chiefly the descendants of the ancient Peruvians. The descendants of the Peruvians are tolerably industrious agriculturists, manufacturers, and fishermen. The coasting trade in the balsas is also carried on by them. They speak the quichua or language of the Incas. The tribes that inhabit the plains live chiefly amid the forests, and along the rivers.

Estimated number of inhabitants—230,819 whites; 848,846 Peruvians; 323,782 Mestizoes; 64,878 mulattoes; and 31,628 slaves: total, 1,499,953.—Distributed as follows in the departments.

But this and all other estimates of the population we consider vaguely calculated, though probably as near an approximation to the number as can be obtained, without taking a regular and correct census.

Of the white, or population of European races, we can say little more than will be found hereafter in the account of Lima. Of their general incapacity, until the people become more intelligent, and public men more virtuous, we have unfortunately too abundant proof.

The most recent description of the population of Peru is drawn up by Von Tschudi. He possibly tells us what he considers true; and other writers unhappily corroborate his assertions, we believe, however, there are many exceptions to the general rule. We extend these exceptions even to all the other states of the Spanish American republics; and the following remarks are, we believe, as applicable to the one as to the other of these states. Of the aboriginal race, what is referable to Peru may be, with little variation, extended to Bolivia, Ecuador, and part of New Granada.

Von Tschudi's account of the state, and his opinion of the prospects, of Peru, do not certainly convey much that is satisfactory, nor much good to hope for. Its moral degradation is significant in the decline of its population, which has been continually diminishing since the establishment of its independence. A great region, which contained an enormous population at the period of the conquest, numbered, according to what was termed the census of 1836, less than 1,400,000 inhabitants, not more than formerly inhabited the department of Cusco alone.

"Not less remarkable," he says, "than the number of illegitimate children (860) is that of the new-born infants exposed and found dead (495). These afford the most striking proofs of the immorality which prevails in Lima, especially among the coloured people; to them belong nearly two-thirds of the illegitimate births, and fully four-fifths of the children cast out to die. There is reason to suspect, though it cannot be posi-

tively proved, that no small portion of the latter suffer a violent death by the hands of their mothers. When a dead child is picked up before the church of San Lazaro, or in the street, it is carried without a word of inquiry to the Pantheon; frequently it is not even thought worth while to bury it. I have seen the vultures dragging about the sweltering carcases of infants and devouring them in the populous streets. . . . On comparing the lists of births and deaths from 1826 to 1842, I satisfied myself that the annual excess of the latter over the former averages 550."

The causes of the decrease of population are ascribed partly to earthquakes, epidemics, and civil wars; and to the corruption of the national character, chiefly aggravating the calamities of the people. All the degraded features of Mexican character, all the public and private vices bequeathed by the Spaniard to his colonial descendants, present themselves, according to Tschudi, in Peru in exaggerated deformity. The white Creoles are described as a gross, sensual, slothful race, with, however, some generous qualities. The men are tall and well-proportioned, but exceedingly effeminate, with, he says, features that might be thought handsome, but for the expression stamped upon them by low vices and sensuality.*

The women of Lima are described as far superior to the men, both corporeally and intellectually; they are affectionate mothers, though their conduct in other respects is any thing but exemplary. It is not for the sake of pleasing their husbands that they cling, with invincible obstinacy, to the use of their national walking garb, the *saya y manto*, in which they take their walks in the streets, quite secure in that disguise from detection, even by the most jealous scrutiny. The veil is inviolable; any one who should attempt to take off a woman's *manto* would be immediately attacked by the populace. The lives of these ladies comprises two phases: in the bloom of beauty their time is divided between "doing nought and naughty doings;" when their charms are on the wane they take to devotion and scandal.†

* "Not that they are wanting in natural abilities, but these are not sufficiently developed by their very imperfect education, and their inveterate indolence prevents them from making good the deficiencies of their early years in after-life. They seldom rise above the sphere of every day matter of fact, and they are ignorant of almost every thing that lies beyond the narrow circle of their town, or at most of their district. I have often been astounded at the gross ignorance displayed by what were called well-educated Peruvians, respecting the position, extent, physical constitution, and the productions of their native land. Incredible as it may appear, it is a positive fact that a Peruvian minister-of-war could not tell either the number of the population or the area of Peru, and maintained with the utmost pertinacity that Portugal formed its eastern boundary, and that one might travel thither from Peru by land. Of past history they know little more than the name of Napoleon; but in talking of him they make the most ludicrous jumble of events, places, dates, and persons. For instance, a gentleman of high rank, who was universally reputed to be a very learned man, once related to me at full length how Frederick the Great drove Napoleon out of Russia."

† "A young lady of Lima rises late, dresses her hair with orange or jasmine flowers, and waits for breakfast, after which she receives or pays visits. During the heat of the day she swings in a hammock, or reclines on a sofa, smoking a cigar. After dinner she again pays visits, and finishes the evening either in the theatre, or the *Plaza*, or on the bridge. Few ladies occupy themselves with needle-work or netting, though some of them possess great skill in those arts. . . . The pride which the fair Limenas take in their dainty little feet knows no bounds. Walking, sitting,

Of all the coloured inhabitants of Lima the free negroes are, in Von Tschudi's opinion, the most hopelessly depraved; and next to them in immorality and vileness are the Zamboes. The mulattoes display better mental qualities; the Mestizoes are little inferior to the white Creoles. The Mestizoes look down on the Indians with contempt, which the latter return with unforgiving hatred. Von Tschudi and others are of opinion that the degenerate descendants of the Spaniards will be exterminated by the aborigines. The first edition of Garcilaso de la Vega's "History of the Incas" was seized and burnt by the Spanish government, "because it contained a prophecy registered in the temple of Cusco long before the arrival of the Spaniards, and which announced the conquest of the kingdom, but added that the Incas would be restored to their throne at some future time by a people from a country called *Inclaterra*." The Indians made fierce attempts in the latter part of the eighteenth century to throw off the Spanish yoke, under Tupac Amaru, a descendant of their Incas. They were vanquished at last, it is said, by Spanish gold, but not until nearly 100,000 Spanish and Peruvian lives had been slaughtered. When the war of liberation broke out, the aboriginal races were easily persuaded to join.

"But," Tschudi says, "it is a great mistake to suppose that the native Indians made common cause with the Creoles against the Spaniards for the purpose of bringing about the present form of government; for their real object was to shake off the foreign yoke, and establish a dynasty of their own, after the pattern of their ancestors. It was not a

or standing, swinging in the hammock, or lying on the sofa, they are ever watchful to let their tiny feet be seen. Praise of their virtue, their understanding, or their beauty, sounds not half so sweetly in their ears as encomiums bestowed on their pretty feet. They take the most scrupulous care of them, and avoid every thing that might favour their enlargement. A large foot (*Pataza Inglesa*, 'an English foot,' as they say) is an abomination to them. I once heard a beautiful European lady deservedly extolled by some fair dames of Lima, but they wound up their eulogies with these words:—'*Pero que pie, valgame Dios! parece una lancha!*' (but what a foot; good heavens! it is like a great boat!) and yet the foot in question would by no means have been thought large in Europe. . . . They have great penetration, sound judgment, and very correct views respecting the most diversified affairs of life. Like the women of Seville, they are remarkable for their quick and pointed repartees, and a Limenas is sure never to come off second best in a war of words. They possess a rare firmness of character, and a courage not generally given to their sex: in these respects they are far superior to the dastardly, vacillating men, and they have played as important a part as the latter (often one much more so) in all the political troubles of the country. Ambitious and aspiring, accustomed to conduct with ease the maziest intrigues, with a presence of mind that never fails them at critical moments, passionate and bold, they mingle in the great game of politics with momentous effect, and usually turn it to their own advantage, seldom to that of the state.

"All these characteristics were combined in a high degree in the person of Dona Francisca Subyaga, the wife of Don Agustin Gamarra, formerly president of Peru. She was accused, indeed, of having been the main cause of the unhappy condition of Peru at the period of Gamarra's rule, but I believe that the real source of the evil lay in her husband's weakness and cowardice. When Gamarra and his troops were pelted with stones by the populace of Lima, in 1834, and he stood whining in the Plaza Mayor, not knowing what to do, Dona Francisca snatched his sword from his side, put herself at the head of the troops, and commanded a well-ordered retreat, the only means by which it was possible to save herself and the remains of the army. A looker-on having ventured to make some offensive remarks on her conduct, she rode up to him and told him, that when she returned she would have a pair of gloves made out of his skin. She died of epilepsy a few months afterwards, in exile in Valparaiso, otherwise she would certainly have fulfilled her threat four years afterwards, when things took a favourable turn for her party."—*Tschudi*.

republic they desired, but a monarchy, and a king chosen from the sacred family of their Incas. Of this the leaders of the revolutionary party were well aware, and they craftily affected to acquiesce in the designs of the Indians, and to labour for their fulfilment. Imperfectly acquainted with the true nature of the liberation war, in which they saw white men fighting against white men, the Indians turned their weapons against all *Pucuncas* (pale faces) and *Mistis*, and killed Spaniards and patriots indifferently as they fell in their way. Their exasperation rose to such a pitch that all who were not of Indian blood were obliged to fly from several provinces, even though they were the most vehement foes of the Spaniards. In *Jauja* the Indians swore they would not leave a white dog or hen alive, and they scraped the very whitewash off the walls of the houses. They carried sack-loads of white people's heads every morning to the market-place, and ripped up the bellies of living Spaniards 'to see how many yards of guts a Godo had.' (Godo is their nickname for a Spaniard.) When General Valdes crossed the river of *Jauja* with a squadron of cavalry, and attacked the Indians assembled at the village of *Ataura*, the latter disdained to save themselves by flight; but catching the lances of the soldiers, they thrust them into their own breasts, crying out, *Matame, Godo* (kill me, Godo!) It seemed as if they hated the foe too much to deign to fly before them. The bodies of 2000 Indians covered the field.

"The provisional government of the patriots reinforced their armies by levies in the conquered provinces. This was the first time the Indians were employed as regular soldiers, and they soon acquired great renown for their coolness and their incredible power of endurance. It was but in few districts they came forward as volunteers, elsewhere they were forced conscripts, and they deserted whenever they had an opportunity."

After the expulsion of the Spaniards, the condition of the aboriginal race was very little improved; some oppressions were removed, new ones were extended to them, and they now remain slaves in the land of their fathers. Is it to be supposed that he should not cherish hatred of all who are not of his own race? It is said by Tschudi that—

"In most of the southern provinces the Indians assemble at cock crow on certain days in the hut of the village senior, or of the cacique, who relates to them the history of the Incas, the deeds of their descendants, and the insurrection of the unfortunate Tupac Amaru; inculcates upon them hatred of the *Pucuncas*; assures them that the rule of their kings will be restored; and sets before them their carefully preserved portraits. These traditions and prophecies will assuredly not remain without effect. The arbitrary proceedings of the government, and the conduct of the Creoles, who treat the Indians more as brutes than as men, are stretching the cord to breaking. The Indians will once more arouse themselves and begin a war of extermination, as under Tupac Amaru, but with more success; after a fearful contest they will win back their native land, and restore their old constitution, with some modifications, perhaps, to suit existing circumstances, but all the other races will have fallen victims to their merciless vengeance."

The prophecy is, we consider, one of those accidents which, like many other oracles, acquires credence from events causing a probability of realising a similar effect. Nor do we believe that a restoration of aboriginal sovereign power would last if it should suppress Spanish republican domination. But when we consider what has been effected by the Indian Carrera in Guatemala, we must hesitate in our judgment, and the remarks of Von Tschudi on this subject are not to be passed over. He says,

"The Indians have made immense progress since the liberation war; they are acquainted with the use of fire-arms and military manœuvres, and *twenty years of uninterrupted civil war have kept them constantly practised in regular campaigning.* Most of

the fugitives from the numerous lost battles escaped with their arms, and these they keep carefully concealed. They are perfectly acquainted with the art of making gunpowder, large quantities of which they prepare and consume in fireworks at all their great festivals; their mountain valleys yield the materials in abundance.

"In 1841, I found eighteen regulation muskets in a miserable little village on the verge of a montaña of central Peru, in the hut of an *alcalde* where I resided for some days. When I asked him off-hand to what end he kept so many weapons, he answered me with a furtive side-long look, 'that there would come a time when they would be useful.'

"The public functionaries and the *Mestizoes* fail not to add perpetually to the accumulated fuel, which needs but a spark to burst into a devouring flame. So soon as the signal is given at any one point, the Indians of all Peru will gather with the speed of the wind under the banners of their leaders; but I believe that none but a man like Tupac Amaru, of imposing corporal and mental qualities, and of the royal lineage, will be able to lead the insurrection to a successful issue; and such a man will be once more forthcoming. What means of resistance can the government command, since its few troops consist for the most part of discontented Indians, who are ready at any moment to desert the hated service, and fight for their own interests? Even the most strenuous aid that could be afforded by European ships of war, would suffice at most to keep some harbours on the coast. The very first onset of the insurgents would be so terrific, that any junction between the *Creoles* and Europeans would be almost out of the question; and how small is their number in comparison with that of the Indians of pure blood!

"The character of the Peruvian Indian is uncommonly sombre: it was not so of yore, to judge from the lively delineations of the oldest writers on the country; but 300 years of tyrannous wrong have marked it with this hue. It is strikingly apparent in their songs, their music, their dances, and their whole domestic economy. Their favourite instruments are the *pututo* and the *jaina*. The former is a great conch shell, with which they produce a dismal music to accompany their mourning dances; in former times it was used at royal obsequies, and now it is sounded almost exclusively on the solemn days of mourning for the fallen native monarchy. The *jaina*, which appears to be a more modern invention, is an extremely simple kind of clarionet, made out of a large reed. The tone is thrillingly sad, unlike that of any other known instrument, and of almost marvellous effect. The wildest horde of Indians, in the uproar of debauchery or in the fiercest broil, grow still, as if by enchantment, if suddenly they hear the notes of the *jaina*, and mute and motionless as statues, they hang in rapt attention on the magic melody. A tear will steal into the Indian's hard eye, that before, perhaps, was never moistened but by intoxication, and the sobs of the women are the only sounds that disturb the almost unearthly music. The sad strains of the *jaina* awaken a nameless, vague yearning, and leave behind them for days a painful void; and yet the magic tones are always heard again with unabated eagerness."

Dr. Smith's remarks on the aborigines, though less sanguine, are also remarkable.

Tangur, in the department of Junin, is one of those Indian villages so common on the elevated slopes which overlook temperate valleys in the interior of Peru. In this village a curate, who for several years visited it, stated to him that there were then two distinct municipalities, each possessing its separate church and magistrates.

The aborigines of each municipality speak the same Quichua language, but do not associate together, nor do they even hold their religious festivals on the same day. The origin of this separation of interests, according to tradition, is as far back as the time of the Incas.

"When," according to Dr. Smith, "some convicts, ordered from Quito, settled at this place, and formed a distinct family, which has here subsisted since that remote

period, without ever mingling its blood with that of its neighbours, or entering into communion or alliance with any other people. This is the more remarkable, as it is the ordinary practice in other remote villages of the interior, for the whole body of men to co-operate in any great work, such as constructing bridges for their common good, or building houses for the convenience of individuals; on which occasions one party conducts stones and turf, another builds the walls, a third conveys timber from the distant woods,* and a fourth cuts and lays on the thatch, &c. The unanimity in this case, and the want of it in that of Tangur, are equally characteristic of that love which the Indian entertains for the usages of his predecessors in all things. If the general revolution has been in any degree useful to the poor uninformed Indian of Peru, who has already sunk from the short-lived excitement of patriotic enthusiasm into the dejection of a military despotism—if it has really improved his prospects, it has been by rousing him, for a while at least, from his wonted apathy to the general concerns and conveniences of life; opening to his view a wider range of imitation and desire, and thus breaking in upon the hereditary routine of his customs and habits, to which, till now, he has adhered with the unvarying constancy of mere instinct."

The christianised Indians of the Inca dynasty, whose native tongue is Quichua (we do not at present speak of the half-christianised Pano, and other yet unsettled tribes of the Montana), are said to be an indolent race; but it is well-known that their exertion increases as the prospect of bettering their condition expands, and that in general their labour is only conducted in a slothful manner when it is compulsory, or to themselves unproductive. When they labour by "*tarea*," or piece-work, and are sure of their wages, they work remarkably well. On their own little farms they are laborious; and if the fruit of their industry were not a temptation to the revenue exactors, they would be more constantly labouring. Dr. Smith truly says,

"It is those who tyrannise over them, who accuse them of laziness, duplicity, and natural perverseness of disposition. Of such persons we may be allowed to ask, 'Have they ever afforded the Indian any rational encouragement to honesty and industry? Have they ever, by fair dealing, persevered in the experiment of deserving the confidence, of conciliating the affections, or of calling forth the kindly sympathies of these humbler sons of the soil? What virtue, except patience, were they permitted to disclose under Spanish oppression (would it were mitigated under the patriot system), when their masters supplied them with the necessities of life just on what terms they pleased, and when the Indians could realise no property, however much they redoubled their toil, for in general the fruit of their labour was not their own?'"

The Peruvian aborigines are for the most part an agricultural people: they live more by tilling the ground than by pasturage or other means.

"Many of the modern villages in the temperate climate of the interior were, not many years ago, large farms, possessed by Europeans or their Creole descendants; but the labourers, set free at the revolution in consequence of the confiscation of the goods and property of their fugitive or ruined masters, have continued to cultivate the land for their own maintenance, till by degrees their families have swelled into villages, and at length assumed the important character of municipalities. With a few years of undisturbed peace, and exemption from undue exactions, small villages may thus arise and become considerable towns, wherever the locality happens to afford sufficient scope for

* As trees of sufficient size for the purposes required are not always at hand, we have seen near a hundred men exhaust their strength in dragging a tree by the means of lassos from deep ravines and hollows. This waste of power might be easily avoided by the help of the pulley, with which they are unacquainted; but they show great skill in the application and management of the lasso, and, when arranged for the tug, their efforts are roused by a song, of which the chorus is "*Huasca runa!*"—Men, to the lasso!—*Smith's Peru.*

cultivation. But as it often occurs that the Indian hamlet is erected on a pinnacle, or on the brow of a hill, around which there is but little suitable soil for the spread of agricultural industry, the consequence is that the father divides and subdivides the same piece of ground among the rising members of his progeny, till at length the means of subsistence become too scanty for the support of the whole family, and, the supernumeraries must seek employment in the mines or elsewhere, as they best may."—*Smith's Peru*.

The arts are little needed by Indians who construct their own huts, and who, with the exception of coarse felt hats, make their own clothes, such as wide trousers or breeches open at the knee, a shirt, a vest, a jacket, and over all a poncho, with sandals of raw hide. In cold localities, as Cerro Pasco, they wear warm woollen stockings and a jacket; not omitting the poncho, which is the indispensable covering by day as well as by night throughout the Sierra. The impediments to the increase of the population of the aboriginal race are the occasionally destructive effects of epidemic diseases, and among the mines in cold regions, an excessive use of spirituous liquors. In the temperate valleys which intervene between the coast and the Cordilleras this vice is by no means so prevalent as at the mines, where money circulates, and all temptation is to be encountered. Licentiousness is usually stated as a further source of depopulation among all classes and castes in Peru: but Dr. Smith avers that,

"Whatever be the true explanation of the fact, we think that evils springing from such fountains of impurity show themselves comparatively little in the Indian constitution; and though strict regularity of conduct cannot be claimed on the part of the Indian family, yet the modesty of their ancient *mamaconas* is still remembered among them; and it is a characteristic which to this day honourably distinguishes the Indians from their more cultivated masters, that with them conjugal infidelity is discouraged, punished, and felt to be a crime."

Incessant warfare and anarchy are as destructive and desolating to the aborigines of Peru, and to the prosperity of the country, as was that of the mines, and manufactories or "obrages," under the Spanish rule. A standing army has become an establishment, as an instrument of despotic and military power, and licentiousness, destroying the true sources of population, the domestic virtues, and domestic habits. It is remarked of the aboriginal Peruvians, that although they have, since the discomfiture of their last bold attempt under Amaru Tupac, endured oppression with silent meekness, they are tenderly alive to feelings of domestic tenderness, and to the natural ties of kindred or of country. These feelings are lamentable, when they are violently seized upon to recruit the army. In the latter condition, wherever the will of the military usurper of the day leads or drives them, they are known to sigh and mourn over the loss of the peaceful freedom which they enjoyed previously,—when they herded their flocks or cultivated their maize, pumpkins, and other simple articles of food. Dr. Smith relates some interesting facts respecting the Peruvians, who were compelled to serve in the *Patriot* (?) army. He says:

"In a hospital, on the coast, we have seen some of these poor fellows unable to speak a sentence of Spanish to the physician who prescribed for their relief; and, in a few extreme instances, despair sunk the powers of life, and a hopeless love of home exhausted their spirits. We have seen one very young lad thus affected who refused food and

medicine, until in silent sorrow he expired, a victim to nostalgia, or a love of home, and a broken heart. These hapless beings, whose devotedness to early attachment and associations bespeaks the warmth and fidelity of their affections, though cherished under a cold and apparently a passionless exterior, we found to be indeed reserved, but sagacious; and, when not under any unusual excitement, their minds, though not cheerful, were serene. Their exterior mien always struck us as solemn, and even sad; but this may be partly the effect of the awfully grand and sublime scenery so familiar to their view, which imparts a solemn and contemplative turn to the thoughts of the mountaineer, and influences his moral feelings in such a manner as stamps a certain air of mental gravity on his general deportment and expression. As an individual, the Indian is timid, and he will sooner take a cuff than give one; but when they assemble for mutual support, then indeed they are seen to fight most valiantly, and, like tame oxen, when the blood of one of their number is shed, they all become fearfully courageous. Bold and bloody battles we have seen between strong parties of the native miners in Cerro Pasco, armed for the combat with slings, stones, and clubs. At festivals, too, when roused by drink or enraged by jealousy, they lacerate and maul each other; and the meek-looking, dumpy Indian woman becomes equally exasperated and vehement if in her quarrels any one should cut away a tress of her long and coarse black hair; for the cutting of these tresses is an odious mark of female dishonour, to which women, of every caste in the land—except the woolly-headed blacks and mulattoes, on whom nature has not bestowed these ornaments,—are most acutely and painfully sensitive.*

“From the beagle courage of the Indian, who, like these gentle animals, fights better in company with others than singly, his military character stands very high; and a regiment of Indians when conducted by gallant officers, as was the case during the war of Peruvian independence, are sure to prove indomitably brave and hardy.”

It is a well-known fact that the dark Zamboes of the sea-coast region, when marching as soldiers, and driven onwards up the Sierra, will sink under fatigue, cold, and privations, which are never experienced in the warm and humid low districts. The native Peruvian, with a *pouch full of coca*, and a bag of roasted maize, marches boldly over the heights, and along precipices as steep as any on which the llama can maintain its footing.

In each village in the mountain valleys, the whites and Mestizoes have “padrinos,” or protectors, of their own caste, holding some authority as captain of volunteers, governor, or alcalde, or more subordinate post, but the Peruvian or Inca native, who cultivates a patch of land, and who labours quietly to rear his family, is liable to and experiences constant oppression. To recruit the armed bands of a Gamara, or other military usurper, the natives of Inca race are torn from their homes or dragged from the caves and fastnesses where they have sought concealment. This cruel injustice is practised towards native races in all the Spanish republics.

Every new levy of conscripts is bound like galley slaves, “and then driven along,” says Dr. Smith, “hopeless and helpless, from the recesses and glens of the interior to the coast, or elsewhere, as circumstances may require, there to die of ague or dysentery, or, if they survive the usual effects of great changes of climate and diet, to be harshly trained for the exercise of war.”

The sixth article of the constitution of Peru suspends the rights of citizenship

* It was a punishment which in certain cases the law of Spain inflicted upon female delinquents, to cut off their hair, and sometimes shave their eyebrows. This, we understand, was done by the common executioner,—hence the sense of disgrace.

to the notoriously vagrant, the gambler, the drunkard, and the married man who, without cause, abandons his wife, or who is divorced on account of his own misconduct. The rich or influential can easily evade this law, but a peculiar oppression is inflicted on the Inca, who is arrested on the alleged ground of being "mal casado," or cohabiting with a woman to whom he has not been previously married by a Roman Catholic priest. It is not impartial justice that he should be punished in this manner for a delinquency which is almost authorised by the practice of his superiors. These poor mountain Incas join together, at an early age, in an union as binding as a marriage is by a Roman Catholic priest; the latter ceremony is, however, not evaded by the Peruvians, when they can either afford to pay the expense, or avail themselves of the opportunity. But to do so the priest must first be paid *his fees*. The poor agricultural Peruvian of the Sierra finds it difficult to provide himself with his coca,* a hoe, and a maschetto, or chopping-knife,—the tools that he usually works with. It is, therefore, almost an impossibility for him to save as many dollars as would enable him to pay even the lowest rate of marriage fees. Not being able to pay the priest for marrying him in the Roman Catholic ceremonial, he thinks it can be no great harm to imitate the Christians of Spanish race around him, whose example ought to be worthy of imitation: and, ignorant of the language which Scripture addresses to his conscience, he contracts a marriage sanctioned by the custom of his nation, though not by the Catholic religion—for *this he is outlawed!!*

It requires, at the same time, great labour for him to pay the capitation tax, from which even the superannuated are not always exempt; yet the treasury professes not to compel the infirm and aged to pay this odious tax. The non-Catholic married outlaw is certainly not exempted.

In order to pay this tax they are often obliged to borrow, for which their labour is mortgaged, and they are in consequence often virtually made slaves for the remainder of life. After death the sons are made to take upon themselves the burden under which the father sank into his grave. To recapitulate the oppressions imposed upon, and the sufferings endured by, the Peruvian Incas, would require a separate work.

They are, without any protection, the victims of arbitrary petty governors

* "The coca leaf is to the Indian of the interior a necessary of life, which he uses from time to time to renovate his energy; in the intervals of labour he often sits down to *chaccha*, or to refresh himself by masticating coca seasoned with a very little quick-lime, which he always carries about his person in a little gourd. According to the Indian, the lime counteracts the natural tendency of the coca to give rise to visceral obstructions. Used in moderate quantity, the coca, when fresh and good, increases nervous energy, removes drowsiness, enlivens the spirits, and enables the Indian to bear cold, wet, great bodily exertion, and even want of food, to a surprising degree, with apparent ease and impunity. Taken to excess, it is said to occasion tremor in the limbs, and, what is worse, a gloomy sort of mania. But such dire effects must be of rare occurrence; since, living for years on the borders of the Montana, and in constant intercourse with persons accustomed to frequent the coca plantations, and with Indian yanacones or labourers, all of whom, whether old or young, masticated this favourite leaf, we never had an opportunity of witnessing a single instance in which the coca-chewer was affected with mania or tremor."—*Dr. Smith's Peru.*

alcaldes, village captains, and military despots, who are destroying this splendid country. The Inca race, which forms the great majority of the Peruvian population, are insecure in their persons and property; they are forced to be submissive in character, by being driven to degraded morals, when torn from their homes to become the vassals of civil and religious bondage.

The curates, who reside in the mountain valleys, are aware of the feelings cherished by the Peruvian race, who believe that the time will arrive when the aboriginal inhabitants of the hills or mountain regions of Peru shall be made to know their own political rights and physical strength,—that they will then be commanded by bold and sagacious captains of their own race, and that they will successfully avenge their wrongs on all “advenedizos” (exotics), their white oppressors.*

There are powerful tribes of independent, and unconquered, aboriginal nations in the more remote parts of Peru, Bolivia, New Granada, Venezuela, the upper parts of Brazil, and the country watered by the Rio Plata, and the Amazon and the tributaries of those rivers. They are in very different circumstances to the conquered nations. All would join in extirpating the Spanish race. But they do not as yet possess the intelligence or the spirit of organisation.

CHAPTER XXI.

AGRICULTURE AND LIVE STOCK.

THE temperate climate of the *Valles* admits of the growth of European grain, maize, and rice; the grasses and fruit trees of Europe succeed; sugar, wine, and distilled brandy constitute articles for home use and for export. In the elevated districts of Montana the cerealia and fruits of Europe are grown, and the valleys produce tropical products: the forests on the eastern declivity of the Andes, yield cinchona bark, copaiva balsam, copal, wax, yellow and black; indigo grows spontaneously. The Indians of the plains collect from the forests vanilla, sarsaparilla, copaiva, copal, caoutchouc, and several gums and resins for export.

Live Stock.—Cattle, mules, and horses are reared, chiefly on the extensive pasture grounds along mountain slopes. On the elevated ranges and table-lands

* “The whites have already an example of retribution in La-paz, where every white man was massacred. The Indians are said to indulge in the hope of yet seeing a prince of their own race on the throne; and such has been their well-founded and now habitual mistrust of the whites, that they have never revealed where all their own treasures and those of the Incas, which were buried after the death of Atahualpa, are to be found. This is a secret to every one but a chosen few of the caciques. A few years before the commencement of the war of independence in Peru, a rising took place among the Indians of some of the inland provinces, under a cacique named Pomacagua; but this insurrection was soon suppressed. The fact of Pomacagua’s being acquainted with the hiding-place of the regal treasure alluded to, and his offer to reveal it to save his life, was not believed by the unrelenting Ramires, and he was shot.”—*Smith*.

of Titicaca and Pasco, llamas are used as beasts of burden ; and each carry about seventy pounds. Sheep are pastured in the colder districts.

Agriculture is not only in a rude state, but it would rather appear to deteriorate than improve since the Peruvian independence of Spanish domination. In the descriptive sketches of the country we have noticed the cultivation of some parts. The valley of Huanuco, is one of the most productive maize districts. It also produces wheat, beans, and other vegetables and grasses. This valley and the plains of Lagamarca, and other rather elevated districts are subject to frosts which occasionally injure the crops ; although the wheat crops, considering the mode of culture, are generally good. Sugar is produced at Huylas, Huanuco, and other places.

The agriculture of Huanuco, though alluring to the eye, which only views its rich and waving fields enclosed with fences of mud, and hedges of the Indian fig, and aloe or maguey plants, is in every way defective as a branch of industry. Dr. Smith, who practically made himself acquainted with the subject of Peruvian agriculture, informs us,

“ The fields owe their luxuriance to nature rather than to man, except in the single advantage of water, which he often directs and applies to them. Manure is a thing never thought of ; and the ground seldom requires it, though we see the same spot year after year under crop ; but much of the soil which is considered poor might be rendered fertile, in so favourable a climate, if the people would only take the trouble of cleaning out their large cattle-pens once a year ; but this would be to diverge from their accustomed routine, which they dislike to forsake. The implements of husbandry are of the rudest kind. The plough, which is slight, and single-handed, is constructed merely of wood, without mould-board, which we have seen a one-handed person manage with perfect dexterity. The ploughshare is a thick iron blade, only tied when required for use by a piece of thong, or lasso, on the point of the plough, which divides the earth very superficially. Where the iron is not at hand, as frequently happens, the poor peasant uses, instead, a share made of hard iron-wood that grows in the Montana. Harrows they have, properly speaking, none ; they sometimes use large clumsy rakes instead ; and we have seen them use a green bough of a tree dragged over the sown ground, with a weight upon it to make it scratch the soil. In room of the roller, of which they never experienced the advantage, they break down the earth in the field intended for cane-plants, after it had got eight or ten ploughings and cross-ploughings, with the heel of a short-handled hoe, which they call ‘ lampa ;’ a tool which they use with great dexterity in weeding the cane-fields and clearing aqueducts. For smoothing down the clods of earth, we have seen some Indians use a more antiquated instrument. It consisted of a soft, flat, and round stone, about the size of a small cheese, which had a hole beaten through its centre by dint of blows with a harder and pointed stone. To the stone thus perforated they fixed a long handle, and as they swung it about, they did great execution in the work of ‘ cuspiando’ or field-levelling.”

Lucern or alfalfa is daily cut down, and used green to feed the numerous cattle and the oxen for the plough and sugar-mills. The scythe is not used. The grass is cut with a sickle. The cattle are fed on irrigated pastures during day, but at night with cut grass in corrals or pens.

Potato-ground is broken up on the face of steepes with deep narrow spades, with long handles. In the same manner the soil is turned up by those who have

neither plough nor oxen, for maize on the temperate flats on the hill-sides, and in the thickets near mountain streams, where the soil is usually fertile, and materials for enclosing abound. Holes are made in the ground with a sharp-pointed stick, where the seed is dropped secure from birds, and when planted in virgin soil, it yields a luxuriant harvest. The white-grained maize is sown in preference to the yellow (*morocho*), as it makes, when toasted, the best "*cancha*," which the poor Indian uses instead of bread; when boiled it makes the sweetest "*mote*," or maize simply boiled; it is also said to yield the most agreeably-tasted *chica*, or beer, which the Peruvians brew in their huts, whenever they have a little surplus maize. They also make a kind of beer from the fermented juice of the maize-stalks which they press between small wooden rollers. Cattle are also fed on dry maize-leaves and stubble, which are considered more nutritious than either lucern or the tops of the sugar-cane.

Aji, or *pimento*, is generally cultivated around the Indian dwellings and gardens in the warm valleys, and with it they season nearly all kinds of food.

The sugar-mills in the valley of Huanuco are, the greater number of them, made of wood, and moved by oxen. On the larger estates brass rollers are used; but with a single exception, on the estate of Andaguaylla, where Dr. Smith was concerned in erecting a water-mill for the purpose of grinding sugar-cane, the proprietors adhere to the old practice of working with oxen by day and by night throughout the year, barring accidents, and feasts or holy-days. He says,—

"The beautiful hacienda or estate of Quicacan is a model of industry and method, after the fashion of the country; and the most distinguished family of Echegoyen have, in Colpa-grande, the finest cane-estate, as far as we know, in the interior of Peru. It extends for nine or ten miles along the fertile banks of the river, from the city of Huanuco towards the ascents that lead into the Montana.

"Respecting Huanuco," he continues, "although the principal city or capital of the department to which it belongs, we have to observe, that the consumption of its agricultural produce, as well as its own internal prosperity, depends on the mineral seat of Cerro Pasco. When the population of Cerro rises to 10,000 or 12,000, every article of Huanuco produce is in high demand; but when, from any cause, the mines are not wrought, or when these are inundated from defective drainage, and the hands employed in working them are fewer in number, the Huanuquenos and other neighbouring agriculturists are greatly discouraged or actually ruined; because, deprived of this outlet for their produce, they cannot undertake the expense of sending sugar and spirits on mules to the coast. The consequence is, that they are frequently poor in the midst of plenty; the owners of extensive herds of sheep on the high pasture-lands, whose wool is of little value to them, as it cannot pay for mule or llama carriage to the coast; and the scanty produce of the looms of the interior have little estimation, as the ruined '*obrages*,' or manufactories, now amply testify. The shuttle is, moreover, nearly put at rest by the cheaper articles of warm woollen as well as cotton clothing continually introduced from the stores of our English manufacturers."—*Smith's Peru*.

A staple article, supplied by Huanuco to Cerro Pasco, is the *coca-leaf*, from the Montana, distant about fifteen leagues from the city. The indigo growers in the contiguous Montana have nearly forsaken its cultivation from want of funds or enterprise.

Much of the fruit of the Huanuco orchards is eaten at the tables of the in-

habitant of Cerro; and in the convents are made excellent sweetmeats, highly valued, in the surrounding country, as presents rather than as articles of commerce.

Several lands formerly belonging to convents were, after the revolution, appropriated as endowments of the college of Huanuco.

The Montana regions, which are watered by the Huallaga, Ucayali, Marañon, and their numerous tributaries, are but very imperfectly explored. They combine the most fertile but uncultivated soils in the valleys.

From May to November the sun shines powerfully in the Montana, and consequently the soil, where it is cleared of wood—as in the valley of Chinchao—becomes so dry that its surface cracks and opens for some depth, but underneath it retains its humidity, and requires no irrigation. From November to May it rains sometimes for six or seven days without intermission.

In the rivers of Peru alligators, tortoises, and a variety of fish abound. The manatee, sometimes called *pexebuey*,* feeds among the grass on the banks of the rivers.

The forest productions of the Montana, considered as articles of commerce or usefulness, are chiefly, cedar, and chonta or ebony, mahogany, walnut, and almond-tree. Edible herbs and roots, except the potato and yuca, are little cultivated; but coffee, plantains, and sugar-cane, of which a variety called the blue or azul grows luxuriantly. The sugar-cane comes to maturity earlier than in other parts of Peru, and yields an annual crop at a very low cost of production.

The fertile valley of Chinchao is renowned for its *coca* plantations. Some farms in Huanuco cultivate frijoles, or beans, for the use of the coca-gatherers: rice is also grown along the low rich banks of the great rivers, and maize is cultivated, wherever it will ripen as a necessary of life.

In the Montana, and in other parts of Peru, *chicha* is made from maize, but the natives here make a drink called *másata*, not known in more civilised parts of the country, produced by chewing the yuca or maize,† &c., and then leaving it to ferment, when, according to the quantity of water added to it, the fermented juice will be found of greater or less intoxicating power.

Indigo and tobacco is of Montana growth.

Cotton grows almost naturally, and requires no artificial assistance for its luxuriant growth. It is spun and wove into cloths of various texture by the Indians. Lemons, limes, oranges, citrons, and other cooling fruit, are also productions of those parts.

The pine-apple is very abundant, as well as of delicious flavour, though it

* From *pexe*, fish. *buey*, ox.

† See account of this liquor, and how made, in the description of the Mosquito Territory.

grows wild: and among the articles of spontaneous growth in the Montana, contiguous to Huanuco, we may enumerate cacao or cocoa, cinnamon, guaiacum, vanilla, black wax, storax, dragon's blood, Maria oil, gum grana, balsam of copaiba, copal, and many other gums, balsams, and resins. Cinchona and sarsaparilla abound in great quantity.

Milk, among the pastoral huts of the high grazing country, is used for making cheese, it is not often drank as an article of nutriment, save by those who live in small round booths. These pastoral huts are scattered over the distant plains and ranges of the mountains, throughout the "*estancias*," on the hilly pasture-lands, for feeding cattle and sheep.

The poor Inca, who owns a few horned cattle, will endure hunger rather than kill for food one of his herd. He who owns sheep, however, kills one occasionally for the meat and "*caldo*,"—*mutton tea*: vegetables being scarce, to make *chupe*, a kind of broth used by the corn-growers. The inhabitants of the snowy region, or elevated valleys of the Andes, are distinguished by their warm clothing, broad chests, and fresh complexions. They descend from the high cold district to the temperate and corn-growing country, to barter for vegetable productions, fresh mutton, skinned and free from offal, which they carry on the back of asses. Mutton, like beef, is dried in the sun, and stored for use by the inhabitants of the warm districts. This dried meat is called by them "*charque*," and by the English jerked beef.

When the inhabitants of Tarma have sown their fields, they usually spend, according to Dr. Smith, an entire month in visiting and festivity:—

"And they say of their neighbours of Jauja (eight leagues to the south of them), whose rejoicing is at harvest-home, that they distrust Providence, while they themselves piously rejoice and rest their hope in the Giver of their harvest; hence, they infer the wheat crops of the Jaujinos (whose granaries are in favourable years the most plentifully stored in all Peru) are often blighted and frosted, while the Tarmenian barley always flourishes."

The pine-apples and coffee of the Montana and hacienda of Vitoc, near Tarma, are very good.

The centre land of Peru is watered by streams and mountain torrents. They are subject, often suddenly, to rise and inundate the low grounds.

The food of the poor, as well as of the rich, constitutes an index to the eatable products of a country, and one may, therefore, include some observation on this head in concluding our sketches of Peruvian agriculture; which may be considered to apply, in many respects, to all the countries of Western South America, between Panama and Chile.

A common dish of food on the Sierra consists of potatoes, sliced and boiled in water or milk, with an addition of eggs, cheese, and sometimes butter: but this nutritious dish is often represented by *yaco-chupe*, or water *chupe*, consisting of potatoes sliced and boiled in water, with the addition of a little salt, and a leaf of wild mint, as an antidote against flatulency.

In Lima the articles of diet are far more varied than in the country districts. Maize is far more generally cultivated than any other grain. Wheat is chiefly imported from Chile and other foreign states. The food of the poor on the sea-coast is cooked camote and yuca roots : both are very nutritive and wholesome. In Lima animal food is even profusely consumed, and poultry in incredible quantities. It is the food of the sick, infirm, and convalescent, who constitute a numerous portion of the inhabitants of the capital, all of whom have chicken or chicken soup at least once a day. Geese and ducks are of low repute for eating, pigeons and turkeys are abundant in the daily market. Fish is usually good and abundant; the fishermen of the coast are described as the most robust of Peruvian natives.

The number of fat pigs killed is estimated considerably above twenty thousand yearly. The consumption of lard and fried pork (*chicharones*) is consequently great. Dr. Smith says the "mantequero," or lard and swine-dealer, is, after that of the baker and *lottery-man* (*suertero*), one of the most lucrative in the capital. From forty to fifty head of oxen, and from three to four hundred sheep, are slaughtered daily for the Lima market: the beef is good; the mutton of inferior quality.

Pastry and sweetmeat criers parade the Lima streets; a cook-stand, with fried pork and fish, stands at the corners of streets and squares. Poor families of genteel pretensions, who from necessity hire out their slaves, are seldom at the expense of cooking at home, and have their food from these cheap cook-stands.

Masamorerias are pap-shops, common in Lima. Of the sweet paps there are as many varieties as there are materials, viz., paps of peas, beans, rice, maize flour, arrow-root, starch, &c. These are boiled in water, with or without fruit or some vegetable acid, and sweetened with sugar, molasses, or coarse sugar, "chancaca," Masamora may be considered as much a Limenian dish as roast-beef in England, or baked fowls in Vienna.

Most of the other Limenian dishes are sodden in lard, excepting the common fowl, the pigeon, turkey, and a dish called the "puchero," consisting of a variety of fruit and vegetables, with pieces of meat of different kinds boiled together and served up in a great dish or plate.

The soups and vegetable dishes are strongly seasoned with agi or Chile pepper.

The native dark races are said by Dr. Smith to be much more robust in form, and hardier in constitution than strangers to the climate;—

"And many of them drink 'aguardiente,' or uncoloured cane spirits, in great quantity, and with less immediate ill effect than one would expect. Their constant use of such excitants as ardent spirits and fermented beverages called 'chichas,' with animal food and agi, may possibly be a principal reason why these persons, whenever they are seized with inflammatory complaints, stand general bleeding better than others of their

own caste fed upon sango, a name applied to a sort of mash made with maize-meal and sweet potatoes; but persons of European descent, with skin so much more delicate than the darker races in Peru, and endowed with a more susceptible nervous system, suffer much more readily from atmospherical vicissitudes; and their digestive organs and powers of assimilation being comparatively weak, those irregularities, borne by the negro and Zambo with comparative impunity, are to the white man, whose organisation is not so suitable as theirs for a warm and relaxing climate, the frequent cause of various disorders of the bowels, as indigestion, cholera morbus, or dysentery."

The Peruvians of the coast are not supplied with fruits. The fruits produced in the orchards in and about Lima are as follow, according to a list by Mr. Mathews, an English botanist, viz.,

"*January*.—Grapes begin to ripen; and also apricots, and a few pears.

"*February*.—Grapes, pears in abundance, apricots; peaches begin to ripen; lucumas scarce; figs.

"*March*.—Grapes in abundance; pears scarce; peaches in abundance; apples begin to ripen; lucumas in abundance; figs in abundance.

"*April*.—Apples in abundance; quinces, ceruela de frayle (*spondias dulcis*), and cerasas (*malpighia glandulosa*), patillas (*psidium lineatum*), and guavas; figs scarce.

"*May*.—The same as April; a few grapes are seen in the market, brought from the southward; cherimollas.

"*June*.—Cherimollas and guanavanas; sweet and sour oranges; a few apples.

"*July*.—The same as June, with the exception of apples and limes; sweet lemons and sour lemons begin to ripen.

"*August*.—The same as July; but slight demand for oranges this month.

"*September*.—Lucumas, paltas, and the fruits of the previous month.

"*October*.—Same as September; but a great demand for limes and sweet lemons.

"*November and December*.—During these two months there is a great demand for sweet and sour lemons, for *frescos*, or cooling drinks. Sweet oranges rarely remain good after the middle of November."

Plantains are fit for food all the year, but are most abundant during the hot months. The pepino is much eaten during December, January, and February. In the months of April and May, the pulp surrounding the seeds in the pod of the pacay are much eaten.

In addition to the above, the melon, and sandia, or musk and water melon, are cultivated in the neighbourhood of Lima, and are to be seen for sale in large heaps at the corners of the streets. They are consumed with avidity in the hot month of February. Very good olives grow in the Valley of the Rimac, and ripen in February and March. Strawberries and "tunas," or Indian figs, of inferior quality, grow in Lima; but the market is supplied with these fruits, and of the best quality, from the neighbouring valley of Santa Ulaya. The pine-apple does not ripen spontaneously in Lima. That eaten in this city grows on the eastern side of Peru, and occasionally are brought from Moro.

CHAPTER XXII.

MANUFACTURES, GOVERNMENT, ETC.

THE Spanish system, which limited supply, forced the inhabitants of Peru to make some indispensable articles. Coarse cotton and woollen stuffs worn by the aborigines and by the Mestizoes, are either made by themselves, or in the valleys of the Marañon, Jauja, and at Cuzco. Iron utensils are made at Caxamarca. At Lima, Arequipa, and Cuzco, gold and silver vessels, utensils, trinkets, and ornaments, are made.* None of these are exported. Coarse cotton cloth, called *tucuya*, made in Moyobamba and Tarapoto, is exported to those parts of Brazil adjacent to the Amazon.

Trade.—The internal trade is obstructed, or rendered difficult, by the want of roads. Since the independence of Peru, a trade has been opened from the eastern districts, with the Brazilian districts adjacent to the Rio Amazon. This trade was chiefly from the valley of the Rio Huallaga, and consists mostly of cotton, gums, resins, wax, sarsaparilla, and *tucuya*. The maritime commerce of Peru is chiefly with the western coasts, and other republics of America, with Mexico, Central America, Guayaquil, and Chile, to which countries sugar, wine, brandy, salt, and some other articles of minor value are exported. Gold and silver, and the saltpetre of Iquique, Arica, and Arequipa, are exported. Chinchilla fur, vicuna and sheep-wool, and chinchona bark, are the principal articles exported to Europe.—(For the Foreign Trade and Navigation of Peru, see Statistics of the Spanish Republics hereafter.)

Government.—The constitution of Peru was framed in 1828. It was to be based on that of the United States. But it will be seen that it has, like that of all the Spanish American republics, in administrative practice, retained most of what existed under Spain, with a strong tendency towards the centralised system of the police of France. The legislative body consists of a senate and a chamber of deputies, the members of which are chosen by the people.† The executive is

* “In Tarma, they make *ponchos*, or loose cloaks, of great beauty and fineness; and, on the colder table-lands, warm but coarse blankets and ponchos, &c., are still made by the Indians. In the valleys, goat-skins are made into cordovans; cow-hide is made into saddle-bags, and *almofrezes*, or travelling-cases for bed and bedding; mats, too, are manufactured from rushes, and are very generally used as carpeting, under the name of *esteras*. But the work of silversmiths is generally in a rude state even in Pasco; for the fine filigree work, for which inland Peru is celebrated, is made, not in the department of Junin, but at Guamanga, in the department of Ayacucho—where the natives have also shown a decided talent for sculpture, though their works cannot be said to exhibit, as yet, much elegance or expression.”—*Smith's Peru*.

† “The chamber of deputies is composed of representatives elected by the electoral colleges of provinces and parishes. The parochial electoral colleges are composed of all the citizens resident in the parish, congregated according to law. For every 200 individuals in a parish an elector is nominated; and in every village whose numbers entitle them to name an elector, or have a paro-

vested in the president, who likewise is chosen by the people for four years, and is assisted by a ministry, chosen by himself, and a council of state chosen by the legislature. The departments have the power of regulating their public and ecclesiastical affairs, without the interference of the general government,—to hold their departmental juntas, and to frame laws for their local territories; these laws require to be afterwards sanctioned by the *central legislature* to become law.

Departments.—The supreme political government of every *department* is vested in a prefect, under immediate *central* subordination to the president of the republic; that of every *province* answers to an *arrondissement* in France, and is intrusted to a *sub-prefect*, who is immediately subordinate to the prefect; that of the *districts* (say *Canton*) to a governor (*juge-de-paix*), who acknowledges the sub-prefect as his superior; and in every town, or Indian village (say *commune*), there is a still humbler officer called *alcalde* (say mayor), who acts under the orders of the governor, or *juge-de-paix*, of his district, and is intrusted with the ordinary routine of local police.

To fill the appointment of prefect, sub-prefect, or governor, it is required that the candidate should be an active citizen, not under thirty years of age, and a man eminent for his probity. (?)

The duties invested in such functionaries are,

1. To maintain public security and order in their respective territories.
2. To cause the articles of the political constitution, the laws enacted by congress, and the decrees and commands of the executive power, to be duly carried into effect.
3. To enforce the completion of sentences pronounced by the different tribunals and courts of justice.

To take care that the functionaries subordinate to each of them shall faithfully discharge their proper duties.

The prefects are charged with the economical administration of the affairs of state within their respective departments. They are restrained from interfering with, or in any degree *interrupting*, the course of popular elections. From preventing the meeting of the departmental juntas, or interfering with the free exercise of their functions. From taking any cognizance in judicial cases; but, should public tranquillity urgently require that any individual should be taken up, a prefect may command his immediate arrest,—transferring the delinquent, accompanied with the grounds of having taken him into custody, to the judicial magistrate or judge, within the precise term of forty-eight hours.

chial college, a municipal body is established with a right to superintend its own local interests, consistently with the laws and public good—and subject to the approbation of the departmental juntas. The electoral colleges of provinces are composed of parochial electors constituted according to law, and they elect deputies to congress in the proportion of one for every 20,000 inhabitants, or for a fractional number which exceeds 10,000. But the province in which the whole population does not come up to 10,000 inhabitants, will nevertheless name a deputy.”—*Smith's Peru*.

This power is found to be exercised to the total subversion of all civil liberty.

Departmental Juntas.—In every department a junta meets in its capital, composed of two members from each province. The functions of these juntas are to provide for administration of the provinces of the departments, and of the department itself. The members are elected after the same manner with those of the Congress or Chamber of Deputies.

The *prefects* of the departments open and preside at the annual sessions of the juntas, to report to them in writing on the state of the public affairs of their respective jurisdictions, and to suggest measures calculated to promote the general interests of the departments. Such as to propose, discuss, and agree about promoting the agricultural, mining, and other branches of industry in their respective provinces. To forward public education and instruction according to the system authorised by congress. To watch over charitable institutions; and, generally, to all that relates to the interior police of the departments, except that of public security. To present the amount of assessments of each department; and to ascertain the amount raised in the particular towns through their respective municipal authorities. To adjudge the number of recruits for the service of the army and navy which each province and district should provide. To exact that the chiefs of the national militia maintain good discipline in their corps, and that they shall be always ready for service. To compel the municipal corporations to discharge their duties, and to inform the prefects of such abuses as they may detect. To audit the accounts required of the municipalities, to make return annually of the funds of the towns and villages. To prepare every five years a statistical report on the department. To provide for the subjugation and civilisation of the aborigines on the frontiers of each department, and to *allure them within the pale of civilised society* by persuasive means. To take cognizance of the imports and exports of the departments, and to transmit their remarks to the home department, or *hacienda*. To apprise congress of any infraction of the constitution; and to elect *senators* from the lists presented by the provincial electoral colleges.*

If the administration of justice were conducted precisely on the foregoing system of government, Peru might be a happy and peaceful country. But the reverse is the general prevalence, and the consequence is, naturally, that the country is in a most unhappy and declining state.

Education.—The university of Lima, and other institutions for education, have been much applauded as schools of learning. There is little doubt, but that a fair share of merit must be attributed to them, and that among the higher classes under the Spanish rule there were, according to the ideas of their nation and their age, accomplished scholars as far as the course of instruction extended.

* See "La Constitucion Politica de la Republica Peruana," published in 1828.

Since the revolution, education appears to have been greatly neglected. With respect to common schools, the attempts appeared to have been unsuccessful, though not in all cases.

Dr. Smith observes on this head,—

“The failure implied on this occasion may possibly have been less the fault of the system than of those who offered to apply it; for it was remarked as very worthy the consideration of the honourable junta, that, in reference to many of the schools intended for the improvement of the indigenous or Indian race, wherein they were merely taught a jargon of Spanish which they could not comprehend, it were better for them to be left in an untutored state of mind than to be placed under the melancholy influence of such teachers as presided over them. These were represented to be so imbecile, and so unacquainted with the merest rudiments of reading, or so abandoned and drowned in vice, as to be persons utterly unfit to guide the mind of infancy and innocence into a proper path. The junta were therefore called upon by their prefect to appoint some better means of instruction, which might at once serve to improve the virtuous feelings of the individual, and promote the national cause of civilisation.”

Hospitals and Charitable Asylums.—In Huaras, as well as in Huanuco, there were formerly well-endowed hospitals, but these are now fallen into such decay for want of funds for their support, that very few invalids can be accommodated or relieved in them; and they are now generally much neglected in Lima.

CHAPTER XXIII.

THE CITY OF LIMA.

WE shall conclude our description of the country which once formed the chief territory of the empire of the Incas, by a brief description, according to the best authorities, of the celebrated city of Lima.

LIMA the capital of the republic, stands in a beautiful valley, six miles from the sea, and 560 feet above its surface; the small River Rimac flows through it. The houses are tolerably built of adobes, or sun-dried bricks, canes, and wood; they are low, in order to stand the shocks of earthquakes, being seldom above two stories, with small balconies to the second floor, with generally an archway from the street, and with a strong door leading to a court within. The lower or ground floor is commonly used as store-rooms and stables, and all kinds of rubbish are stowed away on the tops. The staircase is generally spacious and handsome, and the apartments of the lodgers often adorned with common fresco paintings. For the climate these houses are, however, sufficiently well adapted. The cathedral, the palaces of government and of the archbishop, the university, and several colleges, and some churches are the most remarkable edifices. The population is estimated at about 70,000. There are several unimportant manufactures carried on,—and its trade in foreign merchandise, and

its exports of the produce of the mines, and of the interior, are through the nearly adjacent port of Callao.

Captain Wilkes, who had visited Lima in 1821, and afterwards as commander of the United States Exploring Expedition, in 1841, observes that he was struck with the change which had taken place since his former visit.

"Every thing now betokened poverty and decay : a sad change from its former splendour and wealth. This appearance was observed not only in the city, but also among the inhabitants. Whole families have been swept off, and their former attendants, or strangers, have become the possessors of their houses and property.

"The country has been a scene of commotion and revolution for the last twenty-five years, of which Lima was for a long time the centre. The fate of Lower Peru being entirely dependent on it, and the fortress of Callao, the alternate possessors have stripped it and its inhabitants in every way in their power. It may with truth be designated a declining city.

"The neglected walls and ruined tenements, the want of stir and life among the people, are sad evidences of this decay. The population is now said to be about forty-five thousand, although in former times it has been supposed to amount to as many as sixty-five or seventy thousand.

"The aspect of the city, especially a bird's-eye view from the neighbouring hills, gives to the eye of the stranger the appearance of ruins. There are few buildings that have the look of durability, and no new ones have been put up for the last forty years. The plan of the city combines more advantages than any other that could have been adopted for the locality. The streets are at right angles, and all sufficiently broad. Those which run with the declivity of the ground, north-west and south-east, have water flowing through their middle. The uses to which these streams are put, and the numerous buzzards that frequent them, give the stranger any other idea than that of cleanliness. The buzzards are protected by law, and may be seen fighting for their food in the gutters, regardless of passers-by ; or sitting on the tops of the houses, thirty or forty in a row watching for more food."

The *alemada* is situated on the north side of the city ; its centre is adorned with a number of fountains ; its walks are shaded with trees ; water flows through and refreshes its air. It is, therefore, a delightful promenade. In the evening it is much frequented, and its seats, which are of stone, are occupied by numbers of citizens. This is the best place to see the inhabitants enjoy their *cigarittas*, which they are constantly smoking. The dress of the ladies, however fitted to commit intrigue, is not adapted to the display of beauty.

Captain Wilkes says,

"A more awkward and absurd dress cannot well be conceived. It is by no means indicative of the wearer's rank, for frequently this disguise is ragged and tattered, and assumed under its most forbidding aspect to deceive, or carry on an intrigue, of which it is almost an effectual cloak.

"I never could behold these dresses without considering them as an emblem of the wretched condition of domestic society in this far-famed city.

"The *saya* and *manto* were originally intended as a retiring, modest dress, to mark reserve, to insure seclusion, and to enable ladies to go abroad without an escort. The general term for the wearers is *Tapada*, and they were always held sacred from insult. *Tapada* is likewise applied to a dress which is also frequently seen, viz., a shawl worn over the head, so as to cover the nose, mouth, and forehead. None but the most intimate friend can know the wearers, who frequent the theatres in this disguise. It is to be regretted, that it is now worn for very different purposes from its original intention. Intrigues of all kinds are said to be carried on under it. It enables the wearer to mix in all societies, and to frequent any place of amusement, without being known, and, even if suspected by her husband or relatives, the law of custom would protect her from disco-

very. In this dress, it is said, a wife will pass her own husband when she may be walking with her lover, and the husband may make love to his wife without being aware it is she.

"The saya is a silk petticoat, with numerous small vertical plaits, containing about thirty yards of silk, and costing fifty or sixty dollars. It is drawn in close at the bottom of the dress, so that the wearer is obliged to take very short steps (ten inches). It is a little elastic, and conforms to the shape, whether natural or artificial, from the waist down. The manto is a kind of cloak, of black silk. It is fastened to the saya at the waist, and brought over the head and shoulders from behind, concealing every thing but one eye, and one hand, in which is usually seen a cross, or whose fingers are well ornamented with jewels. Before the manto is arranged, a French shawl of bright colours is thrown over the shoulders, and brought between the openings of the manto in front, hanging down nearly to the feet. The loose saya is also much worn; this is not contracted at the bottom, and in walking has a great swing from side to side.

"The walk of the Lima ladies is graceful and pretty, and they usually have small feet and hands."

The houses are built of adobes, or wood.

The portales, or arcades, form the most attractive parts of Lima. At nearly all hours they are the most lively resort. They are built on two sides of the plaza. The ground-floor is occupied as shops, in which various goods and fancy articles are sold. Between the columns, next the plaza, sit lace and fringe workers; and before them are cooks, fresco-sellers, and others. Frying cakes, and fish, in the morning and late in the evening, seems to be one of the most brisk employments, the demand being remarkable.

The arcades are about five hundred feet long, paved with small stones, interlaid with the knuckle-bones of sheep, which produces a kind of mosaic pavement, in which is wrought the date of its foundation, 1799. This place for many hours of the day is the great resort of the populace.

The palace, formerly that of the viceroy, occupies the north side of the plaza. The lower part of it is now converted into a row of small shops, principally tinkers and small-ware dealers. On the east-side is the archbishop's palace and the cathedral.

The fountain in the centre of the plaza, of which much has been said, was erected in 1600, by Don Garcia Sarmiento Sotomayer, the then viceroy and captain-general of the kingdom. "El que bebe de la pila sequenda in Lima," is the usual saying. "He that drinks of the fountain will not leave Lima."

The cathedral is a stately, large edifice; most of its decorations are in bad taste. Formerly it was celebrated for riches in precious metals and stones.

Its great altar is composed of silver. In a chapel on one side of the building, there are portraits of all its archbishops but the one who, at the revolution, proved faithful to his sovereign; they all, except him, are interred in niches in the crypt, under the great altar. Most of the coffins are open, and exhibit the dried-up remains of the saints, clothed in leather jackets and shoes, which the sacristan will dispose of for a trifle. Two skulls and a hand were obtained by Captain Wilkes.

The market of Lima, kept in an open square, is well supplied. There are no

stalls: mats are used in their stead. The meat is spread in rows, and the vegetables heaped up in piles. The meat is cut with the grain, and into small pieces, to suit the purchasers; and poultry is cut up in a similar manner. The cooking establishments are in great request; stews, fries, and olla podridas, are in constant preparation.

Captain Wilkes observes,—

“The fried dishes seemed to claim their preference, if one could judge by the number in waiting. The expertness of the woman who officiated was truly wonderful, twisting and twirling the dough in her hand, placing it upon a stick, dipping it in the hot oil, and slipping it as soon as cooked dexterously into the dish for her customers. Then again was a frier of pancakes close by, equally expert. The variety of dishes cooking was surprising, and those who fried fish exhibited undoubted proofs of their freshness, by consigning them to the pan before they ceased to live.

“I was surprised at the variety of fish, meats, vegetables, and fruits; the latter particularly. These were in season, and included oranges, cherimoyers, pomegranates, paltas, plantains, bananas, papaws, granadillas, apples, figs, and ananas.

“The above are the usual articles crowded into the market, but were I to stop here, one-half would not be told. All sorts of goods, jewellery, cottons, woollens, laces, hardware, linen fabrics, handkerchiefs, shoes, slippers, hats, &c., are hawked about by pedlars with stentorian lungs, who, with the lottery vendors, with tickets, ink-horn, and pen, selling the tickets in the name of the Holy Virgin and all the saints, make an uproar that one can have little idea of without mixing in or witnessing it.”

The buildings of the convent of San Francisco cover six or seven acres of ground. In its days of monkish prosperity it was a magnificent establishment. Its chapels are still rich in gilding, carved work, &c., and the cloisters are adorned with beautiful fountains and flower-gardens. Part of it is now occupied as barracks, and the muskets are piled on the altars. It has been stripped of its riches and deserted. The gallery of paintings contains, it is said, several Murillos. The remains of its former splendour seem to justify what Father Feuille asserted, “that there was nothing of the kind to compare with it in Europe.” There are few friars at present, formerly it maintained 500, living in luxury and licentiousness.

The *public library* of Lima contains rare books, both in French and Spanish, taken from the Jesuits' college and convents. They are in good order, and among them are numerous manuscripts beautifully illuminated.

A public museum was lately commenced, by forming a collection of Peruvian antiquities, some native birds, and the portraits of all the viceroys, from Pizarro down. At the *cabildo*, or city hall, are to be seen some of the archives of Lima. The signatures of the old viceroys and governors, and, among others, that of Pizarro, is shown. Few of them could write, and they adopted *the rubrica*, by placing the finger of the left hand on the parchment, and making a flourish on each side of it, the clerk filling in the name. This method is said to be generally adopted among the South Americans in signing official documents, and considered as binding as if the name was written.

All classes of people are addicted to the smoking of cigars, even in carriages

and at the dinner-table. It does not seem to be considered by any one as unpleasant, and foreigners have adopted the custom.

Captain Wilkes says,—

“There does not appear to exist any accurate account of the population of Peru; but it is generally believed to have decreased, particularly as regards the whites and negroes. The best information gives but little over 1,000,000 inhabitants, viz., about 125,000 whites; natives and *cholos*, 800,000; with 90,000 negroes and ranchos, of whom about 35,000 are slaves. This does not vary much from the number given by the geographies forty years ago. The country appears, from all accounts, not only to have decreased in population, but to have diminished in wealth and productiveness. A much less proportion of the soil is now cultivated than formerly under the ‘children of the sun.’”*

There are half a dozen newspapers published in Lima, two of which appear

* “The proportion which the different sexes, castes, and conditions, &c., of the inhabitants of Lima bore to one another in the year 1818, may be learned from the subjoined summary taken from the census of Juan Baso, Oidor:—

Summary of Men and Castes.		Summary of Men by Wards.		General Amount of the whole.	Summary of Women by Wards.		Summary of Women by Castes.		
	number.		number.	number.		number.		number.	
Secular Spaniards.	8,406	1st Ward.....	6,841	1st Ward...	7,975	{ Secular Spanish women.	{ 9,455	
Priests and Friars.	1,331	2nd „	5,882	27,545	2nd „ ...	6,990	Nuns.	506	
Mestizoes	2,660	3rd „	6,389	3rd „ ...	7,420	Mestiza women.	3,262	
Indians	1,561	4th „	3,512	26,553	4th „ ...	4,756	Indian women.	1,731	
Free Negroes and Pardos.	4,220	{ Cercado, the higher part of the city so called... }		259	Cercado....	312	{ Black and swarthy free women. }	{ 7,715
Id. slaves.....	4,705	In wards.....		4,662	Id. slaves.	3,884
Total.....	22,883	27,545	54,098	26,553	26,553

“To convey a more particular idea of the different races of people in Lima, as these are divided and subdivided, and change in colour by intermixing with one another, we shall add tables on the subject, given by Dr. Unanue, in his work titled ‘Observaciones sobre el clima de Lima:’—

Intermarriages.		Offspring.	Colour.	Mixture.
Men.	Women.			
European.....	European.....	Creole.....	White.....	
Creole.....	Creole.....	Creole.....	White.....	
White.....	Indian.....	Mestizo.....	White.....	
White.....	Mestiza.....	Creole.....	White.....	
White.....	Negress.....	Mulatto.....	½ negro, ½ white.
White.....	Mulatta.....	Quarteron.....	½ negro, white.
White.....	Quarterona.....	Quinteron.....	½ negro, white.
White.....	Quinterona.....	White.....		
Negro.....	Indian.....	Chino.....		

“The same author gives the following as the retrograde intermarriages, by which the offspring are of more dingy appearance, and made to recede more and more from white, which he takes as the standard primitive colour:—

Marriages.		Offspring.	Colour.
Men.	Women.		
Negro	Negress.....	Negro.....	
Negro	Mulatta.....	Zambo.....	3-4th negro, 1-4th white.
Negro.....	Zambo.....	Dark Zambo.....	7-8th negro, 1-8th white.
Negro.....	Dark Zambo.....	Negro.....	15-16th negro, 1-16th white.
Negro.....	China.....	Zambo.....	

daily. They are small sheets—but have some control over public opinion—few or no advertisements are seen in them. These are deemed unnecessary in Lima, all the amusements, such as the theatre, cock-fighting, &c., are placarded on the portals.

Most of the buildings in Lima have suffered more or less from earthquakes.

Chorrillos, three leagues to the south of Lima, is the favourite watering-place, and frequented during the sultry months by gambling parties and persons of rank and fashion from town. It is a small village of fishermen, constructed of cane and mud. The Indian owners of the shades, and of some houses or *ranchos*, let them to the bathers during the bathing season; and some persons either take these for a term of years, or construct light houses for themselves, which they fit up tastefully, and pass the summer months in them in the midst of gaiety and mirth. Chorillos is sheltered from the south-western blast by an elevated promontory, called the *Mora-Solar*, which rises like a gigantic *guaca* overlooking the numerous monuments, or Pagan temples, of this name which are scattered over the naturally rich, but now in a great measure waste and desolate plain, that extends from Lima to Chorrillos.

During the raw, damp, and foggy months of July and August in Lima, Chorrillo enjoys a clear sky and a genial air. The south-westerns, laden with heavy clouds, spend their strength on the Moro-Solar (on which burst the only thunder-storm witnessed by the Limeniens in the memory of any one now living), and divide into two currents; the one pursues the direction of the village of Miraflores, and the other, the hacienda of San Juan, leaving Chorrillos clear and serene between. Thus protected, Chorrillos does not experience the chilly mists of winter; and it is the great hospital of convalescence for agueish, asthmatic, dysenteric, rheumatic, and various other sorts of invalids from the capital during the misty season.

The salutary practice of bathing in the sea was in former times confined chiefly to those affected with cutaneous diseases; but within the last fifty or sixty years sea-bathing has been preferred to river-bathing, or to the cold baths by the old Alameda, and fountain of Piedra-lisa. The women are usually cleanly in their persons; but, however, congenial cleanliness may be to their sex, they, like the sick and bearded men, seem to be greatly afraid of ablution in hectic fever, and some other diseases with which they are often visited.

CALLAO AND THE ISLAND OF SAN LORENZO.

Captain Wilkes, who anchored for ten days at San Lorenzo, measured its three highest points with barometers. The result gave 896 feet for the southern, 920 feet for the middle, and 1284 feet for the northern summit.

“Upon the latter,” he says, “the clouds generally rest, and it is the only place on the island where vegetation is enabled to exist. The others are all barren sandy hills. It is said that the only plant which has been cultivated is the potato, and that only on the north peak. This *becomes possible* there from the moisture of the clouds, and their shielding it from the hot sun.

"Quantities of shell-fish are found on the shore, and the waters abound with excellent fish.

"The burying-ground is the only object of interest here. The graves are covered with white shells, and a white board, on which is inscribed the name, &c. They appear to be mostly of Englishmen and Americans, and it would seem that the mortality had been great. But when one comes to consider the large number of men of-war which have been lying in the bay, and the period of time elapsed, the number of interments do not seem large."

The Bay of Callao, with the climate, combined with the prevailing winds, renders it a fine harbour. The island of San Lorenzo protects it on the west from the swell of the ocean, but its northern side is entirely exposed; but there is no danger to be apprehended from that quarter. A few miles to the north the influence of San Lorenzo ceases; the surf there breaks very heavily upon the beach, and prevents any landing.

The plain rises gradually from Callao towards Lima. From the bay it is seen distinctly, about six miles distant, and does not appear to be elevated; yet Captain Wilkes, who measured the height of Mr. Bartlett's house above the level of the sea by sympiesometer, found it 420 feet high. This rise is scarcely perceptible passing over the road, except to one who has a practised eye.

Since 1821, Callao had improved, notwithstanding the vicissitudes it has gone through since that time.

"A fine mole has been erected, surrounded by an iron railing. On it is a guard-house, with soldiers lounging about, and some two or three on guard.

"The mole affords every convenience for landing from small vessels and boats. The streets of Callao have been made much wider, and the town has a more decent appearance. Water is conducted from the canal to the mole, and a railway takes the goods to the fortress, which is now converted into a depôt. This place, the sea-port of Lima, must be one of the great resorts of shipping, not only for its safety, but for the convenience of providing supplies. The best idea of its trade will be formed from the number of vessels that frequent it. I have understood that there is generally about the same number as we found in port, namely, forty-two, nine of which were ships of war; five American, two French, one Chilian, and thirty-five Peruvian merchantmen, large and small."—*Narrative*.

The castle of Callao has long been the key of Peru. Whichever party has had it in possession were considered as the possessors of the country. It is now converted into a custom-house, and is nearly dismantled. Only five of its guns remain out of 145.

The Limenians are said by Dr. Smith to be fond of seasonable bathing, and the pleasures of a watering-place, which they know how to enjoy for three months in the year.

The principal street of Callao runs parallel with the bay. There are a few tolerably well-built two-story houses on the main street, which is paved. These houses are built of adobes, and have flat roofs, which is no inconvenience, in consequence of the absence of heavy rains. The interior of the houses is of the commonest kind of work. The partition-walls are built of cane, closely laced together. The houses of the common people are of one story, and about ten feet high; some of them have a grated window, but most of them only a doorway and one room.

Other dwellings are nothing more than mud walls, with holes covered with a mat, and the same overhead.

The outskirts of Callao deserve mentioning only for their excessive filth.

The donations to the clergy or priests, at two small chapels, are collected on Saturdays from the inhabitants. On the evening of the same day, the devotees of the church, headed by the priest, carry a small portable altar through the street, decorated with much tinsel, and various coloured glass lamps, on which is a rude painting of the Virgin. As they walk, they chant their prayers.

The market is held in a square of about one and a half acres. The stands for selling meat are placed indiscriminately, or without order. Beef is sold for from four to six cents the pound, is cut in the direction of its fibre, and looks filthy. It is killed on the commons, and the hide, head, and horns are left for the buzzards and dogs. The rest is brought to market on the backs of donkeys. Chickens are cut up to suit purchasers. Fish and vegetables are abundant, and of good kinds, and good fruit may be had if ordered from Lima. Every thing confirms, on landing, the truth of the geographical adage, "In Peru it never rains. It appears everywhere dusty and parched up."

The situation of old Callao is still visible under the water. The very foundation seems to have been upturned and shaken to pieces, and the whole submerged by a mighty sea. The wonder is that any one escaped to tell the tale.

"Two crosses mark the height to which the sea rose. The upper one, one-third of the way to Lima, indicates the extreme distance to which the water flowed; the lower one marks the place whither the Spanish frigate was carried. I very much doubt the truth of either. I can easily conceive that a great wave would be sufficient to carry a large vessel from her moorings half a mile inland, but I cannot imagine how the water should have reached the height of one hundred and fifty feet at least above the level of the sea, and yet permitted two hundred inhabitants of old Callao to have escaped on the walls of a church that are not half that height.

"Outside the walls of the fortress are several large vaults, filled with the dead, in all stages of decay, and on which the vultures were gorging themselves; this was a revolting spectacle. Many are thrown in naked, and covered only with a few inches of sand. Great numbers of skeletons are still seen with pieces of clothing hanging to them. Dogs and vultures in great numbers were everywhere feeding upon the dead, or standing aloof fairly gorged with their disgusting repast. If any thing is calculated to make a people brutal, and to prevent the inculcation of proper feeling, it is such revolting sights as these."

Callao is said to contain between two and three thousand inhabitants, but this number seems to be overrated. Several new buildings are in course of erection, notwithstanding the times of revolution. The principal street is about a third of a mile in length, and is tolerably well paved, with side-walks.

"Billiard-signs stare you in the face. This may be set down as the great amusement, to which may be added the favourite *monté* at night."

Coaches, or rather omnibuses, run several times a day to Lima. The old accounts of robberies on the road to Lima, are still fresh in the mouths of strangers. In times of revolution it was infested by robbers, but the steps taken by government have effectually put a stop to them.

On the road to Lima is Bella Vista; but it is in ruins, and has been so ever since the revolution. It was generally the outpost or battle-ground of the two parties, and although the soil in the plain which borders the sea is extremely fertile, consisting of decomposed rock, containing the elements of fertility in the greatest abundance, it is now a neglected waste. On approaching Lima, the gardens and fields are cultivated and irrigated. Fields of Indian corn are seen, some fully ripe, some half-grown, and others just shooting up. This bears testimony not only to the fineness of the climate, but to the fertility of the soil. The gardens near the city are filled to profusion with fruits of all descriptions.

The road, on its near approach to the city, forms an avenue of about a mile in length. This, in its prosperous days, was the usual, and most agreeable evening drive. On each side are gardens filled with orange-trees, the fragrance of whose flowers, and the beauty and variety of the fruit, add to its attractions. It is now going to decay from utter neglect. *It is typical of Peru.*

CHAPTER XXIV.

BOLIVIA.

BOLIVIA extends north to south from 10 deg. 30 min., to 25 deg. south latitude; and east to west from about 57 deg. 50 min., to about 71 deg. 30 min. west longitude. It extends nearly three degrees and a half along the Pacific. The greatest length is estimated about 940 miles. The greatest breadth at about 850 miles.

Bolivia is bounded on the north by Peru; on the east by Brazil, and by the republic of Paraguay; south by the Gran Chaco, the republic of Salta, and Chile.

The region between the Pacific and the Andes is appropriately called the Desert of Atacamà. Few parts of it are stated to be fit for agriculture. The streams which flow from the mountains, are soon lost in the sands. The country south of the Alturas de Lipez consists chiefly of rocky ridges, with little vegetation, except in the elevated valleys, which are about 5000 feet above the level of the sea. In the latter, the grains of Europe, maize, and the fruits of southern Europe, are cultivated. The valley of Titicaca has a fertile soil, especially in the neighbourhood of the lake, where quinoa, potatoes, and barley are cultivated; but generally no other grains or culinary vegetables succeed, owing to the severity of the climate. The valleys south of the Sierra de la Cruz are the most populous and best-cultivated parts of Bolivia. The valley of Cochabamba, is reputed for the richness of its soil and products. The *Yungas*, or small valleys north of the Sierra de Santa Cruz, are also productive. The rivers that

drain these valleys, generally bring down gold, of which a considerable quantity has been collected. The Plains of Moxos and Chuquitos are covered with forests, with occasional savannahs. But although extremely fertile, they are thinly peopled, and inhabitants and cultivation appears only along some of the river banks.

The River Loa flows, for about 180 miles, to the Pacific, but brings down so little water that in summer it is only about fifteen feet broad at its mouth, and only a few inches in depth. Almost every other stream flowing west from the Andes is lost in the sands, and does not reach the sea. The Rio Desaguadero, which drains the valley of Titicaca, runs about 200 miles, until it disappears among some swamps and lakes. Many rivers descend from the eastern declivity of the Andes; and those which drain the country south of the Alturas de Lipez are also very numerous. They unite either with the rivers which fall into the Rio Madeira, or with those which constitute the most remote branches of the Pilcomayo, a great tributary of the Paraguay. Near 10 deg. 30 min. south latitude, the Madeira is joined by the navigable Beni. The Guapahi and Mamoré, as well as the Beni, are navigable from the places where they leave the mountains. The navigation of the Rio Madeira is, however, interrupted by cataracts, which occur between 9 deg. and 10 deg. south latitude. The cataract of Theotonio is said to be fifty feet high. Farther down the Madeira is free from impediments to navigation, and may be navigated by vessels of any size to the Amazon. But the Beni, Mamoré, Pilcomayo, and Bermejo, are navigable either to the Amazon, or Paraguay, for vessels sufficiently large to navigate the Atlantic.—(See account of the Rivers Amazon and Paraguay hereafter).

The natural facilities for inland navigation possessed by Bolivia, east of the Cordilleras, and the fertility and power of production of which the soil is capable, are sufficiently great to render Bolivia a very rich and important nation.

Climate and Agriculture.—The discovered regions of Bolivia vary greatly in climate and productions. The region of Atacama is sterile, as it never rains; fogs are common during a part of the year. A little maize is cultivated in a few spots. The valley of Titicaca and the plains of Moxos and Chuquitos present a great contrast: both regions have a rainy season, which occurs from November to April; but while the rain descends in showers on the valleys, it falls in torrents on the plains. On the plains cacao, coca, indigo, cotton, rice, mandioc, and several tropical fruits are grown, whilst the forests supply copaiva balsam, sarsaparilla, caoutchouc, vanilla, and canella de clavo, and many other valuable plants and fruits, and excellent timber. The valleys between the mountains and plains have a temperate climate, and sufficient rain for the growth of the grains and fruits of Europe in the higher, and those of tropical countries in

the lower regions. The forests of the eastern declivity of the Andes yielded chinchona bark.

The valley of Titicaca as well as the savannahs of the plain, supplies pasture for cattle, horses, mules, and sheep. The mountain precipices, which are almost inaccessible to man, are resorted to by herds of guanacoës, vicunas, and llamas; a great number of llamas are used as beasts of burden in the valley of Titicaca. Fish is very plentiful in the rivers. Vicuna and sheep-wool, together with some hides, are articles exported to foreign countries.

Minerals.—Gold occurs in all the valleys of the Yungas, and is considered abundant in the Tipuani, a tributary of the Beni. Large pieces of native gold are found in rivers. Gold is also found in a mountain near the coast, but it is not worked. The mines of Potosi have, for a long period, supplied more silver than all the other mines of the world, and they are still worked, but it is said with loss. Mines occur in the valley of Titicaca, near Oruro, and west of Potosi, and in some other places. Copper is found in abundance on the surface, near the southern extremity of the valley of Titicaca: the ore is described as very rich, but it is not yet brought to the Pacific, as it will not pay the expense of carriage. Iron and lead occur, but they are not mined.

Population.—The population consists of the Spanish race, Mestizoës, and aborigines. The latter constitute about three-fourths of the whole, and they are most numerous in the valley of Titicaca, in the Yungas, and on the plains. The native population of the valley of Titicaca consists of Peruvians, who are distinguished by their industry in agriculture, and the rearing of cattle and llamas. They speak the Quichua language. The plains are inhabited by numerous tribes, most of which are comprehended under the names of Moxos and Chiquitos. The Moxos, who are said to have been civilised by the missionaries, who commenced their labours about 200 years ago, have become an agricultural people; they cultivate different kinds of plants and roots, and live in fixed habitations. The Chiquitos appear to have retained their nomade habits. The Chiriguanos and Zamucos are independent natives. Of the Spanish race, and of the Christianised aborigines, most of what is said relative to the inhabitants of Peru, applies to Bolivia.

Nothing can be more vague than the estimates of the population, which range from 500,000 to 1,500,000 inhabitants. The area of the departments into which Bolivia is divided has been computed as follows:—

1. Lamar, 30,000; 2. Cinti, 20,000; 3. Tarija, 12,000; 4. Potosi, 40,000; 5. Oruro, 12,000; 6. Chuquisaca, 24,000; 7. Cochabamba, 18,000; 8. La Paz, 65,000; 9. Santa Cruz de la Sierra, 159,000;—Total area, 380,000 square miles. These computations are mere estimates.

The department of Lamar, which comprises the sea-coast, is remarkable for its sterility. It has some harbours seldom visited by European shipping,

with the exception of Cobija or Lamar. It contains about 1500 inhabitants, but is a miserable place : provisions, and even water, are brought to it from a great distance.

The department of Zinta or Cinti is divided into two provinces, Lipez and Cinti. In the fertile valley of Cinti considerable quantities of wine and brandy are manufactured. *Tupiza*, on the road leading from Buenos Ayres to Potosi, has about 5000 inhabitants, with some silver mines in the neighbourhood. Cinti has about 2000 inhabitants, and traffic in wine and brandy.

The department of Tarija lies to the east of Cinti, and comprehends the country west of that which is inhabited by the Chiriguano Indians, and is drained by the Rio de Tarija, an affluent of the Vermejo, and its tributaries. It is a country chiefly of high mountains, with some fertile valleys, which produce tropical products. The capital Tarija has about 2000 inhabitants.

The department of Potosi comprehends the mountainous country north of the Alturas de Lipez, of Porco, and the Eastern Bolivian Andes, as far north as the sources of the Cochabamba. It is divided into the provinces of Chichas, Porco, and Cayanta. Nearly the whole area is occupied by mountains rising above the limit of vegetation. It contains the richest silver mines of Bolivia. *Potosi*, the capital, is built on the declivity of the Cerro de Potosi. The town is situated at nearly 13,000 feet above the level of the ocean, and has about 30,000 inhabitants. About 250 years ago, it is said to have contained about 100,000 inhabitants. The streets are narrow and steep, but the houses are substantial. The surrounding country is destitute of vegetation. The mines are above the town, and elevated about 15,000 feet above the sea.

The department of Oruro occupies the valley of Titicaca, the Western Bolivian Andes. It is divided into the provinces of Oruro, Paria, and Carangas. Grain is scarcely cultivated, unless it be *quinoa* ; it has extensive pastures. There are several rich silver mines ; and copper, though abundant, cannot be smelted from an utter want of wood, or other fuel than reeds or rushes, and the transport of the ore where it can be smelted is by far too expensive. Oruro, the capital, is situated in the valley of Titicaca, about 12,000 feet above the sea-level, and contains about 6000 inhabitants, engaged chiefly in working the silver mines in the neighbourhood.

The department of Chuquisaca comprehends the southern districts of the valleys south of the Sierra de la Santa Cruz ; the vale of the Rio Pilcomayo, and the eastern portion of the basin of the Rio Guapahi : it is divided into the provinces of Yamparaes and Tomina. The valleys are broad and fertile, and in some districts tolerably cultivated. The mountains contain some silver-mines. The capital, Chuquisaca, is the seat of the general government of Bolivia. It is built in a beautiful valley, 9000 feet above the level of the sea. It has a cathedral and several substantial buildings, about 25,000 inhabitants, several institutions

for education, including a university and mining school. Two roads lead from this town to the valley of Titicaca, that of Levichuco to Oruro, and that of Tolapalca to La Paz; the latter leads over a pass 14,375 feet above the sea.

The department of Cochabamba is divided into the provinces of Sacába Tapacará, Arque, Palca, Clissa, and Mizque, and contains the most populous and agricultural districts of the republic. All the grains and fruits of Southern Europe succeed in perfection: the products are sent partly to the valley of Titicaca, and partly to other departments. The silver-mines are of little value as far as worked; some gold is collected in the rivers. Cochabamba is situated in a valley on the banks of a small river. Oropesa, the capital of the department, has 16,000 inhabitants, and has manufactures of cotton and glass.

The department of La Paz extends over the central parts of the valley of Titicaca, and it also comprehends the eastern range of the Bolivian Andes with the Yungas, and the plain as far east as the Rio Beni. It is divided into the provinces of Pacajes, Sicasica, Omasuyos, Larecaja, Chulumani, and Apolobamba. Gold and chinchona bark are among its most important products. La Paz, the capital of the department, is situated in a narrow valley, many hundred feet below the level of the valley of Titicaca, on the banks of the Rio Chuqueapo. It contains about 20,000 inhabitants, and is the most trading town in the republic. A road over the pass of Gualillas (14,200 feet above the sea) leads from La Paz to the coast of Peru, and another over that of Pacuani (15,226 feet high) to Cochabamba and Oropesa. By these roads European commodities are brought to the countries east of the Andes, and gold and bark are exported by those routes.

The department of Santa Cruz de la Sierra includes nearly the whole of the eastern plains; it is divided into the provinces of Valle Grande, Pampas, and Baures, and the regions of Moxos, Chiquitos, and Chiriguano. Near the declivities of the Sierra de la Cruz, and along the banks of the Guapahí, there are settlements of Spanish races: the whole of the other parts are occupied by the native tribes, who are agriculturists, and also manufacturers of rudely-made cotton stuffs. The natural fertility of the department is remarkable, but nothing is, however, produced for exportation. The capital, San Lorenzo de la Frontera, situated on the banks of the Guapahí, is not far from the old town of Santa Cruz de la Sierra: it has about 4000 inhabitants, of whom about 1500 are of European race.

The great difficulty and expense of carrying commodities over the Andes to the populous districts of Bolivia, separated from the Pacific, had compelled the inhabitants to become their own manufacturers. Cottons and woollens are manufactured; tanneries are also numerous. There are also some glass-works, and manufactories of hats, cloth, &c.

We can say little of the government or statistics of this country. The

executive, administrative, and legislative government differs little from that of Peru. Our observations on, and accounts of, the climate of Peru, apply as nearly as possible to Bolivia.—(See also the most recent maps of both countries.) Bolivia is a region of great natural advantages, which require only a thrifty, industrious, and skilful population to render its eastern provinces, especially, one of the most productive countries in South America.

CHAPTER XXV.

CHILE.

CHILE extends along the Pacific from about 25 deg. to 41 deg. 50 min. south latitude; the island of Chiloe is separated from the continent by the straits of Chacao, and extends to 43 deg. 30 min. south latitude. Chile lies between 69 deg. and 72 deg. west longitude; from south to north its length is about 1170 miles, its breadth varies from 100 to 200 miles.

On the north Chile is separated from Bolivia by a desert, the boundary-line on the coast of the Pacific is near the village of Paposo.

The Andes, the highest part of which constitutes the eastern boundary-line of Chile, together with the high mountain masses which form the western declivity of the Andes, occupy a great part of the area of Chile; north of the Cuesta de Chacabuco, there are valleys between lofty ridges similar to the valleys of Peru; south of that there are extensive plains, and few ridges of hills except along the coast, where the highlands are almost continuous.

The western declivity of the Andes is abrupt and intersected by ravines, through which the rivers descend with impetuosity. The parts fit for cultivation are limited to where these ravines change into vales or plains. Southward the lower declivities are covered with fruit, northward they are generally bare and rocky.* There are silver mines, but few of them are worked. The hilly country is, in many parts, sandy or rocky, without any vegetation excepting some patches of cactus and coarse grass. The crops of maize in the mountain districts are said not to be sufficient for the inhabitants, who derive their chief means of subsistence from the labour in, and produce of the silver and copper mines, and partly also from the fruits of the upper valleys. The plains, in most parts, afford good

* In the narrative of the United States Exploring Expedition, Captain Wilkes observes—"On approaching the coast of Chile, every one is anxious to get a sight of the Cordilleras. There are only two periods during the day in which they can be seen to advantage, viz., in the morning before sunrise, and in the evening at sunset. The first is the most striking view. The outline is at that time of a golden hue, and may be easily traced, in a long line, running north and south. This gradually brightens, and is lost the moment the sun is seen. The evening view gives rise to disappointment. The mountains are seen at a great distance (eighty miles in a bird's flight), reflecting the setting sun, and, in consequence, appear much lower than is anticipated."

pastures. Some districts are fit for agriculture, and the remaining portions are sandy flats. The arable districts of Chile supply the countries of South America on the Pacific with grain, and the pastures with jerked beef and hides. The undulated country between the plains and the sea is, in many parts, covered with stunted trees; but grapes, and other delicious fruits, are also grown in the hilly countries.

Rivers.—The rivers of Chile, north of the Maypù, bring down little water; none are navigable; they serve, however, the important purpose of irrigating the lands. South of the Maypù, in 34 deg., the rains fall in sufficient quantities, and the rivers, though deeper, are not used for irrigation. The River Maule is navigable for vessels drawing about seven feet of water; it is navigable for river barges for about twenty miles. The Biobio, the largest of the rivers of Chile, flows a course of nearly 200 miles; at its mouth it is two miles wide, but too shallow for large vessels to enter. It is navigable for river craft to Nacimiento, about 100 miles from its mouth. The River Callacalla is deep enough for large vessels to enter its mouth. There are no large lakes of any importance in the valleys and plains. In the Andes there are some lakes, but, as far as known, the largest is not more than fifteen miles in length.

Climate.—Extending from north to south for sixteen degrees, and with a very irregular surface, the temperature of the climate of Chile is consequently variable. In the valleys, especially in that of Copiabo, years pass over without rain falling. Further south showers occur only during three or four years, after which a rainy season drenches these southern valleys. In Aconcagua still further south, the number of rainy days do not generally exceed fourteen to twenty-one. South of the River Maypù rain falls sufficient for the cultivation of grain. At and near the River Biobio, rain falls regularly in winter, otherwise the sky is cloudless during six or seven months of the year; south of that river the rains are irregular, and fall heavily. The regions where rains fall are covered with forests; many of the trees afford excellent timber. In the arid regions, a few shrubs, stunted trees, and cactus, are the chief natural products.

The vegetable productions cultivated are similar to those of southern Europe. Maize is cultivated in the northern parts of Chile; wheat and barley are generally grown in the southern plains; and wheat and flour are exported to Peru and other places. Grapes, fruits, and such vegetables as are common in southern Europe, are produced abundantly in the valleys as far south as the River Biobio. The wines, of tolerable quality, are made for home use. Timber is exported from Chile and other parts.

The pastures of the southern provinces feed large herds of cattle; jerked beef, tallow, hides, and live stock are exported. Guanacoës and llamas abound in the northern provinces.

Minerals.—Gold is found in the sands of the rivers. It was formerly, but

not at present, collected. Silver mines exist in the Andes ; south of 33 deg., north of that parallel they are numerous in the ridges between the valleys. In the arid and sterile desert between the valleys of Copiabo and Huasco, they are worked to a considerable extent. Copper ore abounds in the same region, and is imported into England, chiefly into Swansea to be smelted. Lead and iron exist, but they are not worked. In the country on the northern banks of the River Biobio there are extensive coal-fields partially worked. Salt is made from the water of a salt lake; it is also imported, partly from Peru, by sea, and from the native tribes of Patagonia, who make it from the salt lakes of that country.

Population.—The population of Chile consists of the descendants of the Spaniards, and aboriginal tribes. All the inhabitants, north of the River Biobio, are of European race, with scarcely any mixture of Indian blood. The aboriginals occupy almost exclusively the country south of the River Biobio. South of the Biobio the inhabitants known under the name of Araucanians, have preserved their independence in defiance of the Spaniards. They derive their subsistence chiefly from cultivating maize, potatoes, beans, and vegetables; and they rear large herds of cattle and horses. During the war of independence they made destructive inroads upon the country north of the Biobio; a successful war was afterwards carried on against them, which ended in a peaceful agreement.

As no census, that we know of, has been ever taken of the population, we can only state, that by an estimate made some years ago, the population was stated at 1,200,000 souls. The present population is considered to exceed 1,300,000 souls, exclusive of the Araucanians.

CHILE is divided into eight provinces, the area of which is estimated in square miles as follows:—Coquimbo, 48,000; Aconcagua, 14,000; Santiago, 12,000; Colchagua, 15,000; Maule, 12,000; Concepcion, 18,000; Valdivia, 40,000; Chiloe, 11,000: total area, 170,000 square miles.

Towns.—Copiabo, in the valley of the same name, about forty-five miles from the sea, has nearly 3000 inhabitants. Its port on the coast is bad, as the surf rolls in heavily, and the landing is very difficult; copper, copper ore, and silver are laden at this port, which has a village with about 1100 inhabitants. Ballenar, in the valley of the River Huasco, about forty-five miles from the sea, owes its rise to some silver mines in the neighbourhood. It contains about 7000 inhabitants, and takes its name from Ballenagh in Ireland, the birth-place of the family of O'Higgins. La Serena, or Coquimbo, the capital of the province of the same name, is situated in the valley of the same name, about seven miles from the sea; it contains nearly 8000 inhabitants, and exports silver and copper ore; the harbour which is at the mouth of the river, is one of the best on this coast. Illapel, with about 1500 inhabitants, is situated in the neighbourhood of copper mines.

The province of Aconcagua comprehends the southern portion of the *Valles*, including the Andes to the east of it. The valleys of Chuapa, Quilimari, Ligua, and Aconcagua are wide and fertile, especially the last. This province is com-

posed of the former provinces of Quillota and Aconcagua. Its commercial wealth consists in its agricultural productions, especially wheat and cattle. It has also some mines of silver and copper, but with the exception of those of Petorca, they are not considered rich. A fertile and well-cultivated plain, which is an expansion of the Valley of Aconcagua, has the towns of Felipe and Santa Rosa de Aconcagua : each with from 5000 to 6000 inhabitants. Quillota, about twenty miles from the sea, has 8000 inhabitants, and is surrounded by orchards.

CONCEPCION, about two miles from the bank of the Biobio, and six miles from its mouth, was once the capital of Chile. It has been repeatedly destroyed by earthquakes, and devastated by the invasion of the Araucanians. Since its destruction by the great earthquake of 1835, it is nearly all in ruins. Timber and cattle are exported. Valdivia, the capital of the province of the same name, has an excellent harbour, well fortified, and contains about 2000 inhabitants.

THE ISLAND OF CHILOE is about 100 miles long, and, on an average, forty miles wide. The western shores of the island are rocky masses rising abruptly from the ocean to the height of 1500 or 3000 feet. The eastern shores are of moderate elevation, and in their natural state covered with forests among which are magnificent timber-trees. Rocky islands are scattered over the Gulf of Ancud, most of which are inhabited; Quinchao and Lemuy are populous. The inhabitants of the settlements of Calubco and Carelmapú are chiefly Indians, few in number, and occupied chiefly in cultivating timber. The majority of the inhabitants of Chiloe and of the adjacent islands are aborigines. The whole population of the province of Chiloe in 1832, amounted to 43,000. They export timber, wheat, hams, &c. The shores and bays abound in varieties of excellent fish. The shellfish is described as delicious.

SAN CARLOS is the capital of the province of the same name, with a good harbour, and about 4000 inhabitants.

Manufactures.—The facility with which foreign manufactured goods can be imported into Chile has wisely discouraged the establishment of any important manufactures. A large portion of the population, however, wear home-made stuffs, especially woollen; the importation of British manufactures is increasing : steam-boats from England ply along the coast of Chile ; but under the Spanish rule the coasting trade was discouraged.—(See Statistics and Trade of Chile hereafter.)

In 1810, the population of Chile rose against Spain, they were defeated in 1814 at Rancagua by General Osorio, and obliged to submit to their former rulers. In 1817 San Martin, with an army from Mendoza, gained the battles of Chacabuco (1817) and Maypú (1818), the result of which was the independence of the country. The constitution then adopted is still considered the fundamental law, and formed on the principle of a centralized government. The executive power is vested in a supreme director. The legislature is composed of a senate and a house of representatives. The senate consists of twenty members at the most, and every 15,000 inhabitants sends a member to the house of representatives.

CHAPTER XXVI.

DESCRIPTIVE SKETCHES OF CHILE AND VALPARAISO: SANTIAGO COPPER MINES.

VALPARAISO has increased in population, extent, and importance within the last twenty years, and has become the great sea-port of Chile and the western coast. Its harbour is inferior to others on the coast, yet it is the nearest and most convenient port to *Santiago*, the capital.*

Captain Wilkes says,

"I have had some opportunity of knowing Valparaiso, and contrasting its present state with that of 1821 and 1822. It was then a mere village, composed, with but few exceptions, of straggling ranchos. It has now the appearance of a thickly settled town, with a population of 30,000, five times the number it had then. It is divided into two parts, one of which is known by the name of the Port, and is the old town; the other by that of the Almendral, occupying a level plain to the east. Its location is by no means such as to show it to advantage. The principal buildings are the custom-house, two churches, and the houses occupying the main street. Most of the buildings are of one story, and are built of adobes or sun-dried brick. The walls of the buildings are from four to six feet thick. The reason for this mode of building is the frequent occurrence of earthquakes. The streets are well paved. The plaza has not much to recommend it. The government-house is an inferior building. Great improvements are now making, and many buildings on the eve of erection.

"They are about bringing water from one of the neighbouring springs on the hill, which, if the supply is sufficient, will give the town many comforts. On the hills are many neat and comfortable dwellings, surrounded by flower-gardens. These are chiefly occupied by the families of American and English merchants. This is the most pleasant part of the town, and enjoys a beautiful view of the harbour. The ascent to it is made quite easy by a well-constructed road through a ravine. The height is 210 feet above the sea. The east end of the Almendral is also occupied by the wealthy citizens. The lower classes live in the ravines. Many of their habitations are scarcely sufficient to keep them dry during the rainy season. They are built of reeds, plastered with mud, and thatched with straw. They seldom contain more than one apartment.

"The well-known hills to the south of the port, called the 'Main and Fore Top,' are the principal localities of the grog-shops and their customers. These two hills, and the gorge (*quebrada*) between them, seem to contain a large proportion of the worthless population of both sexes. The females, remarkable for their black eyes and red 'bayetas,' are an annoyance to the authorities, the trade, and the commanders of vessels,

* Captain Wilkes observes, "The northers are greatly dreaded, although I think without much cause. One of them, and the last of any force, I had myself experienced in June, 1822 (whilst in command of a merchant vessel). In it eighteen sail of vessels were lost. But since that time vessels are much better provided with cables and anchors, and what proved a disastrous storm then would now scarcely be felt. I do not deem the bay so dangerous as it has the name of being. The great difficulty of the port is its confined space, and in the event of a gale, the sea that sets in is so heavy, that vessels are liable to come in contact with each other, and to be more or less injured. The port is too limited in extent to accommodate the trade that is carried on in it. Various schemes and improvements are talked of, but none that are feasible. The depth of water opposes an almost insuperable obstacle to its improvement by piers. The enterprise of the government, and of the inhabitants of Valparaiso, is, I am well satisfied, equal to any undertaking that is practicable.

"From the best accounts, I am satisfied that the harbour is filling up, from the wash of the hills. Although this may seem but a small amount of deposition, yet after a lapse of sixteen years, the change was quite perceptible to me, and the oldest residents confirmed the fact. The anchorage of the vessels has changed, and what before was thought an extremely dangerous situation, is now considered the best in the event of bad weather. The sea is to be feared rather than the wind, for the latter seldom blows home, because the land immediately behind the city rises in abrupt hills, to the height of from 800 to 1500 and 2000 feet."

and equally so to the poor sailors, who seldom leave this port without empty pockets and injured health.

"It was difficult to realise the improvement and change that had taken place in the habits of the people, and the advancement in civil order and civilisation. On my former visit, there was no sort of order, regulation, or good government. Robbery, murder, and vices of all kinds, were openly committed. The exercise of arbitrary military power alone existed. Not only with the natives, but among foreigners, gambling and knavery of the lowest order, and all the demoralising effects that accompany them prevailed.

"I myself saw on my former visit several dead bodies exposed in the public squares, victims of the *cuchillo*. This was the result of a night's debauch, and the fracas attendant upon it. No other punishment awaited the culprits than the remorse of their own conscience.

"Now, Valparaiso, and indeed all Chile, shows a great change for the better; order reigns throughout; crime is rarely heard of, and never goes unpunished; good order and decorum prevail outwardly everywhere: that engine of good government, an active and efficient police, has been established. It is admirably regulated, and brought fully into action, not only for the protection of life and property, but in adding to the comforts of the inhabitants."

The Chilians, when compared with other South Americans, love their country, and are fond of their homes. The people are attached to agriculture, and the lower orders are better disposed towards foreigners than in the other Spanish *republics*. Schools and colleges have been established, and a desire to extend the benefits of education throughout the population is evinced.

The police consists of two distinct bodies, one mounted, the other on foot.

"The watchmen carry swords only. The former patrol the streets on horseback, while the latter take their particular walk round a square or two, for which they are responsible. A message may be sent through them to the furthest end of the city, and an answer returned, in fifteen minutes. They carry a loud and shrill whistle, the sounds of which are varied as occasion requires, and by it a concentration of force can be effected in a few moments.

"When they cry the hour they all sing the same tune, but the pitch is ranged in accordance with the scope of the voice. The manner of singing the hour, *Viva Chili, Viva Chili, las diez anda y serena*, is pleasing.

"In the morning they add a prayer, as *Ave Maria purissima las cinco y media*.

"This police adds greatly to the comfort as well as to the safety of the inhabitants. To give an instance of its effects, apothecaries are chosen weekly to keep their shops open all night, and in case of sickness or requiring any aid, one has only to call for the *vigilante*, who takes the recipe and passes it to the next, and so on to the shop, where it is obtained, and returned as soon as possible, without any trouble whatever. They have their particular rounds, and each door is obliged to have a padlock. If any door is found without it, they put a lock on, for which the owner has to pay a fine of four dollars to the city to have it removed; half is the reward of the vigilante.

"A complaint during our stay was made by one of the officers, of exactions made by a policeman. It was instantly taken notice of, and punished. It is to be regretted that this police should still wear the military uniform, as it seems unbecoming in a republican form of government; at least we thought so."

The shops are well filled with articles of English, American, and French manufacture. The markets are abundantly supplied. There are no market-gardens in the vicinity of Valparaiso, and most of the vegetables are brought from the valley of Quillota, in panniers, on the backs of mules; grass or clover is brought to market on horseback, which almost covers both horse and rider.

Among the few amusements is a small theatre, and an amphitheatre, the *chingano*, both of which are usually open on a Sunday evening. Also the national Chilean dance called the *samacueca*. It is usually performed at the *chingano*, which is surrounded by apartments where refreshments, including liquors and spirits, are sold. It is generally filled by both sexes. The *samacueca* is danced on a kind of stage; the music is performed by females, on an old-fashioned harp, one end of which rests on the lap of the performer, and the other on the stage ten feet off. A girl beats time merrily on the sounding-board of the instrument. On the right is another, strumming the common chords on a wire-string guitar, making a full sweep across the strings; they sing also a national love-song.

The *samacueca* is danced by a young man and woman, the former gaudily decked in a scarlet jacket, embroidered with gold lace, white pantaloons, red sash, and pumps, with a small red cap; the dress of the young woman is a gaudily-painted muslin dress, short, and starched, over which is thrown a rich-coloured shawl; these, with silk stockings and pumps, complete her costume. These last are characteristic of the Chilean women of all classes. Silk stockings are even worn by the washerwomen at their tubs. The head is adorned only by the hair, parted from the forehead back to the neck, and descending in two long plaits on each shoulder to the waist. The dance is a kind of fandango. Captain Wilkes says,

“The higher classes of females have the name of being virtuous and estimable in their domestic circle, but we cannot say that they are beautiful. They dress their hair with great care and taste. Their feet are small, and they have a graceful carriage. The French fashion of dress prevails, and they are just beginning to wear bonnets. The advancement of civilisation is rapid; the imitation of foreign habits and customs will soon predominate over those of Chile; and what is of more consequence, some attention is being paid to their education.”*

Flowers are but little cultivated. Few gardens are yet to be seen of any consequence. They require constant irrigation most part of the year, which may account for this neglect. There are two in the *Almendral*, kept in tolerable order.

When the American exploring squadron was at Valparaiso, the place was honoured by the president's visit, which, connected with the late victory and successes against Peru, caused much rejoicing; every attention was shown to the chief magistrate. He was taken on an aquatic excursion, on board of a small brigantine decked out with the flags of all nations, and was accompanied by the civil authorities of Valparaiso, the English admiral, and others. On passing the men-of-war he received the customary salute.

“Three balls were given during the stay of the squadron here, in consequence of

* A rather singular occurrence took place at a review of the militia on the *Plaiancia*, one Sunday, by the president, who was attended by his daughter, and a number of the most respectable ladies of the place. They marched down the line, and afterwards danced with the officers on the field, in the presence of the soldiers. All the South Americans are inveterate dancers, the Chileans taking the lead. The taste for music is general, but although they have a number of national airs, few have been printed. All the printed music in common use is foreign, as are the instruments. Pianos are to be seen in almost every house.

the visit of the president (General Prieto); one in honour of the recent victory of Yungai over the Peruvians; the others by the citizens and foreigners to his excellency. As the former was an extraordinary occasion, a description of it will give some insight into the manner in which they conduct these affairs in Chile. All three were managed in a manner that would have been highly creditable in any part of the world.

"The place selected for the great ball was between the walls of two large unfinished storehouses, a space of 150 feet long by ninety wide, over which temporary arches were built, the whole covered with an awning lined with blue, and studded with stars, from which were suspended some twenty very handsome chandeliers. The whole was carpeted, and the various pillars which supported the roof were decorated with emblems of the victory and nation. At the end, opposite to the entrance, was a transparency of *General Bulnes, the hero of Yungai*, surrounded with scrolls of the deeds. Along the corridors which the piazzas formed, ranges of sofas and seats were placed; on the walls were hung rich mirrors and paintings: the former rested on massive pier-tables, in which hundreds of lights were seen reflected, whilst the graceful festoons of the national flags and pennants formed into draperies, intermixed with wreaths of flowers and evergreens in endless variety, encircling emblematic designs of the nation's glory, produced an effect not easily surpassed. The reception-room of the president was hung with scarlet tapestry, decorated with paintings, mirrors, and pier-tables, and brilliantly lighted with chandeliers, &c."

There were card-rooms, smoking-rooms, supper-rooms, a dressing-room for the ladies, in which were hair-dressers and mantua-makers in attendance. All Valparaiso had sent furniture of every kind, and even the churches had contributed to the great gala fête in commemoration of the national victory.

The company consisted of about 500, one-third of whom were females. Many uniforms added to its brilliancy.

About ten o'clock, the ball was opened by the president, Don Joaquim Prieto, dressed in a richly-embroidered coat, gold epaulettes, and field-marshal's sash. He danced a minuet with a lady of Valparaiso, after which the dancing became general, consisting of quadrilles, country-dances, waltzes, and the samacueca, cachuca, and lordean.

Marches and national airs were played and sung. The ball did not break up until eight o'clock next morning, at which hour the president and his daughter were escorted home by a procession of dancers, with music playing national airs, &c.

On reaching General Prieto's quarters they sang a national hymn, after which they were invited in, where they again continued dancing until noon.

Captain Wilkes observes,—

"The whole equalled, if it did not surpass, any of our own fêtes in the United States; indeed all who attended were much surprised, having little idea that Valparaiso could have made so brilliant and tasteful a display of beauty and magnificence."

Previous to the arrival of Captain Wilkes at Valparaiso, the naturalists and some officers belonging to the *Peacock* and *Relief* had made excursions into the interior. On his arrival he allowed those who could be spared, and were desirous of visiting Santiago, to set out for that city, and to others with a view of extending their journey to the Cordilleras.

The *bilocha*, a vehicle somewhat resembling a double gig, is generally used for travelling in Chile.

"They have a most rickety and worn-out appearance; almost every part appears mended with cords made of hide. They accommodate two passengers; and the time required between Valparaiso and the city (Santiago), is about eighteen or twenty hours. In the shafts a horse is put; a postilion rides one on the left, and sometimes another is placed on the right, both being fastened to the vehicle by lassos of raw-hide proceeding from the saddle. Each vehicle is attended by three bilocheros or drivers, with a drove of twelve or fifteen horses, forming quite a cavalcade."

The bilocheros are expert riders. Their horses are small, but spirited, and bear fatigue well. Their usual speed is about nine or ten miles an hour. Few equipages can compare with their crazy machines, driven up hill and down dale, with all their accompaniments of horses, guachos, &c.; and it affords no small amusement to those on foot, to witness the consternation of the affrighted passengers, in momentary expectation of a break-down.

"Fortunately the road was excellent, though at this season (May) it is divested of much of its beauty from the want of vegetation. The interest is, however, carried forward to the lofty peaks of the Andes, of whose summits occasional glimpses are had; and the eye glances over the surrounding scenery in the immediate neighbourhood, that would elsewhere be deemed grand, to rest on some high and towering peak. Among these the peak of Tupongati is the most noted, ranking, since the measurement of King, as next in height to the Himmaleh mountains."

The first stopping-place on the road to Santiago is Casa Blanca, a pueblo of about 500 inhabitants, where travellers usually sleep. The accommodations were recently much improved. In the neighbourhood is the only wooded tract in this part of the country. Casa Blanca is 598 feet above the level of the sea.

The road thence passes through Curacovi, a small pueblo, where trap-rock first makes its appearance, and then over a high ridge, called the Cuesta des Zapata. The second plain is of similar character, and extends to the Cuesta del Prado. It is passed over by a zigzag road. On reaching the top, 2394 feet high, the view is magnificent.

The peaks of the Andes, covered with eternal snow, some reaching above the clouds, appear but a few miles off, although twenty leagues distant. Beneath are the grazing grounds of the plain, covered with flocks and herds.

"Variety and life are given to the whole by the view of the national road, on which are seen numbers of vehicles, mules, &c., threading their way up and down the mountain-side, laden with foreign and domestic products. This is the only road of any extent for wheel-carriages in the country. It is kept in good repair by convicts, who are seen working in chains. A moveable prison, or lock-up house, somewhat resembling the cages used in caravans of wild beasts, is used for their accommodation and security at night."

Heavy merchandise is transported in huge ox-carts. No iron is used in their structure; wooden pins and raw-hide lashings, are made to answer the purpose. The yoke is set on the heads of the oxen, behind the horns, and fastened to them. The creaking of these carts may be heard for miles, the drivers never greasing the axles. They are generally drawn by from four to eight oxen.

Light goods are drawn by mules, immense numbers of which are seen on the road at all times.

When travelling in biloches, the relays are made as soon as the shaft-horse tires; he is quickly taken out, and one of the drove caught with a lasso, and put in his place. These relays occur every eight or ten miles; the only relief the horses have is a trot out of harness, without a load. The bilocheros seldom dismount; all is done on horseback. On going up hill, a third or even a fourth horse is soon hitched to the vehicle to assist the draught. The horses are all in good condition, and it is not a little remarkable that they should be so, for their only food was chopped straw. The teamsters and guachos are equally abstemious. They live mostly upon bread and their favourite *chica*, made from the grape, and resembles cider; but after it has passed through a fermentation, it is intoxicating. Mud-huts, or ranchos, are seen on the road-side.

Begging is common on this road.

"The beggars let themselves to the highest bidders, and value themselves according to their deformities. At Valparaiso, two days are allowed in each week for begging."

The plain of Maypo, which reaches to the foot of Cuesta del Prado, is extremely level, and nearly thirty miles in width, extending to the foot of the Cordilleras. The road leads nearly in a straight line over it to the city of Santiago on the eastern side of the plain.

SANTIAGO.—The elevation of Santiago above the sea is 1591 feet, and stands on the third step or plain from the coast. Its entrance is through avenues between high adobe walls.

The Cordilleras have at all times an imposing aspect when seen from the neighbourhood of Santiago, and their irregular outline is constantly varying under the effects of light and shade. Santiago is surrounded by orchards, gardens, farms, and grazing-grounds. The city being enclosed by high adobe walls, gives it a gloomy appearance until entered, when the streets have a fresh and clean look—it is laid out in squares. The streets are paved, and have sidewalks. This clean appearance is owing to a law obliging the inhabitants to whitewash their houses and walls once a year, and to the white contrasting with the red-tiled roofs. The houses are mostly one-story high, built round a court or square, from twenty to forty feet wide, round which the rooms are situated. The roof projects to form a kind of piazza or covered way. The gateway is usually large, and the rooms on each side of it are not connected with the rest of the building, but rented as shops. Opposite to the gateway is the centre window, guarded by a light and ornamental iron frame, painted green or richly gilt. The court is usually paved with small pebbles from the bed of the Maypocho, arranged fancifully: in many cases, the courts are laid out in flower-plats, with roses and geraniums.

The River Maypocho runs through one portion of Santiago, and supplies it

with water. In the centre of the city is the great plaza, where the public buildings are situated. These are built of a coarse kind of porphyry from the mountains; the cathedral and palace each occupy one side; in the centre is a fountain, with several small statues of Italian marble. All the public buildings are much out of repair, having been damaged by earthquakes.

The cathedral is a large edifice—its altar is decked with gold and silver. There are within it paintings and hangings, among which is a large number of trophies, taken in the wars. The niches are filled with wax figures of saints, and there are also “the remains of two martyrs of the church, in a tolerably good state of preservation.”

The palace, originally built for the viceroy, is now appropriated to the accommodation of the president and the public offices. On the side opposite to the palace is a colonnade, not yet finished, intended to occupy one whole side of the plaza. Under its portico are fancy and dry goods shops, and between the columns various trades, or lace and fringe-makers work. In the evening it is resorted to by females, with large flat baskets, vending shoes, fruit, and fancy articles; others are cooking cakes, and the whole portico is lighted up, and much resorted to.

The mint occupies a square; it has never been completed, and has suffered from earthquakes. The operation of coining is in the rudest form. Both rolling and cutting are done by mule power.

The public library contains several thousand volumes, which formerly belonged to the Jesuits, and many curious manuscripts relating to the Indians.

The amusements are chiefly the theatre and chingano, and it is called a quiet city. The siesta is daily indulged in; even the shops are shut in the afternoon, and the city is as quiet as midnight. Towards the cool of the evening, the aborigines resort to the alameda, a beautiful walk, well shaded, about a mile in extent, along one bank of the river. It is planted with a double row of poplar trees. Streams of water are constantly running on each side of the walk; within a few yards of each stone seats are placed, which are at times filled with a well-dressed population.

The evenings are often passed at *tertulias*, social or quiet family parties, or in shopping in the colonnade. The inhabitants are addicted to gambling. *Monte* is the game with the higher classes, whilst *match-penny* is that of the lower orders. The Chilean women are remarkable for their ease of manner, kindness, and attention to strangers; they are fond of diversions, particularly dancing and music; most of them have good figures, and some would be called pretty, but their teeth are generally defective.

The men of the upper class and the ladies generally adopt the European fashions. The dress of the lower classes is a mixture of Spanish and Indian—they are fond of bright colours; over their shirt and trousers is worn a blue or brown

poncha. A high-crowned and small-rimmed hat, tied on under the chin, over a bright cotton handkerchief on the head, completes their outfit. They are a well-disposed people, and have more the air of contentment than any other nation of South America.

The markets are well supplied ; there is one near the banks of the Maypocho which covers an area of four or five acres, and is surrounded by a low building, with a tile-roof, supported by columns, under which meats of all kinds are sold. In the centre are sold vegetables, fruits, flowers, poultry, and small-wares ; the market-women are seated under awnings, screens, and large umbrellas, to keep off the sun. The market is clean.

The average price of a horse is twelve dollars, but some that are well broken are valued high.

The climate of Chile is justly celebrated, that of Santiago is delightful ; the temperature is usually between 60 deg. and 75 deg. The country round is extremely arid, and were it not for its mountain streams, which afford the means of irrigation, all Chile would be a barren waste for two-thirds of the year. Rains fall only during the winter months (June to September), and after they have occurred the whole country is decked with flowers ; the rains often last several days, are excessively heavy, and during their continuance the rivers become impassable torrents. At Santiago the climate is drier and colder, but snow rarely falls ; on the ascent of the Cordilleras, the aridity increases with the cold ; the snow was found much in the same state as at Terra del Fuego, lying in patches about the summits. Even the high peak of Tupongati was bare in places, and to judge from appearances, it seldom rains in the highest regions of the Cordilleras, to which cause may be imputed the absence of glaciers.

The party which made the excursion to the Cordilleras left Santiago in biloches, and travelled to the eastward five leagues, to the "Snow Bank" from which the city is supplied. The ascent was gradual, and with no intervening ravines. They then took horses, leaving their biloches to return. Their route after this lay up a valley. On the surrounding heights guanacoës were seen in great numbers.

As they proceeded, the middle region was marked by spiny plants, principally burnadesia. The soil was found to be a mixture of loose earth and pieces of rock. On rising higher, the vegetation became almost wholly extinct ; places occurred of an eighth of a mile in breadth destitute of verdure of any kind. The party then ascended a ridge belonging to the main body of the Cordilleras, and at an elevation of about 10,000 feet, they reached its summit. Here they had an-extensive view of the line of snow peaks. That of Tupongati appeared the most conspicuous, although at a distance of eighty miles. The guide asserted that he could see smoke issuing from its volcano in a faint streak ; the peak itself, from this view of it, was sharp-pointed. The scene immediately around them was one of grandeur and desolation ; mountain after mountain, separated

by immense chasms, to the depth of thousands of feet, and the sides broken in the most fantastic forms imaginable. In these higher parts of the Cordilleras they found a large admixture of jaspery aluminous rock, which forms the base of the finest porphyries; also chlorite in abundance. The rock likewise contains fine white chalcedony in irregular, straggling masses. Trachytic breccia was observed in various places. The porphyry is of a dull purple colour, rather lighter than the red sandstone of the United States. No traces of cellular lava were observed, nor of other more recent volcanic productions. No limestone was seen in the regions traversed by the party; all the lime used at Santiago is obtained from sea-shells; nor were any proper sedimentary rocks seen. Complete silence reigned everywhere; not a living thing appeared.

After spending some time on the top they began their descent; and after two hours' hard travelling they descended below the snow line, and passed the night very comfortably in the open air, with their blankets and pillions, or saddle-cloths. Fuel for a fire they unexpectedly found in abundance: the alpinia umbellifera answering admirably for that purpose, from the quantity of resinous matter it contains. Near their camp was the bank of snow from which the city has been supplied for many years—it covers several acres. The snow line here seemed to have remained unchanged. The height they had ascended was supposed to have been about 11,000 feet, and the Cordilleras opposite them about 4000 feet higher. The view of the mass of the Cordilleras, in its general outline, was not unlike those of Mont Blanc and other mountains in Switzerland.

They succeeded in killing one of the guanacoës nine feet in length and four feet in height. They were found to frequent only the most inaccessible summits, and are said never to leave the vicinity of the snow; they feed upon several small thorny bushes, which impart a flavour to their flesh, and a smell to their excrement that may be distinguished at some distance from their places of resort. Benzoar is often found in its stomach, and is highly prized among the natives and Spaniards as a remedy for various complaints. It is also used as a gum.

All the party suffered greatly from the heat of the sun's rays and the dryness of the atmosphere; their faces and hands were blistered, and the nose and lips made exceedingly sore, while the reflection of the light from the snow caused a painful sensation to the eyes.

The next day they reached Santiago, whence they returned to the *port*, as Valparaiso is usually distinguished in the country.

Over the Maypocho at Santiago there is a stone bridge with five arches. For nine months of almost every year, the bed of the stream is nearly dry, but in winter and spring, during the melting of the snows, it becomes a torrent, and from the damage that has been done in former times, they have taken the precaution to wall it in on the side of the city, towards the Cordilleras, for several

miles, with stone and hard brick. When swollen it is a quarter of a mile wide, rapid and deep, and would cut off the communication with the surrounding country were it not for the stone bridge.

Messrs. Couthouy and Dana made a trip to the copper-mines of San Felipe. They left Valparaiso on the 17th for San Felipe, which is about 100 miles north of Valparaiso. They travelled in a biloche as far as Quillota, a distance of forty miles, and proceeded thence to San Felipe on horses. The road to Quillota was found good, although many hills and valleys were passed over.

For the first twenty-five miles the road led along the sea-shore, with no higher elevation than about 200 feet. At six miles from Valparaiso, the road cuts through a bed of sienite, remarkable for the vertical dikes of granite by which it is intersected.

Ten miles before reaching Quillota, the road passes over a level plain, which extends beyond that place. The hills which bound the valley to the south are low, until approaching Quillota, near which, in the south and south-eastern direction, a lofty ridge rises, adjoining the campagna of Quillota, one of the high cone sea-marks for the harbour of Valparaiso. The town, or city of Quillota, occupies the centre of the valley, and is twenty miles from the sea.

The town of Quillota (according to a Mr. Blanchard, who keeps an inn for strangers), is three leagues in circumference. It contains several churches. The "calle largo," the longest street, is upwards of a league in length. The same authority gives its population at 10,000 inhabitants. The houses are all one story high, built of adobes, with thatched roofs. There is an abundance of fine building-stone, but in a region of earthquakes the lightest materials are used. Almost every house has a vineyard attached to it, the grapes of which were of good quality and abundant. A portion of the grapes rot upon the vines, as the inhabitants have not the industry or the inclination to manufacture them, although by proper attention they would yield good wine; they only manufacture some into a hard and acid wine, called *masta*, or boil the juice down to the favourite drink of the lower classes, called *chicha*, which somewhat resembles perry or cider in flavour. The small quantity that is not consumed is distilled and sold at Valparaiso. Besides grapes, Spanish wheat and Indian corn are cultivated. Apples, pears, and quinces are also raised. The former are inferior, the latter superior in quality and in great plenty.

Oranges are abundant, but of indifferent flavour.

Quillota is supplied with water from the River Concon or Aconcagua, which is led through all the streets and gardens of the place. It is used for all household purposes as taken directly from the gutters, which are the recipients of dirt of every description from the town. For drinking, it is allowed to settle in large jars kept for the purpose.

The intercourse with strangers at Quillota has been much less than at Valparaiso or Santiago, and consequently the people are more bigoted. About four years previous to this visit, they burnt, in the public square, a large number of Bibles in the Spanish language, along with a heap of immoral and indecent pamphlets, in the presence of the civil, military, and ecclesiastical authorities. These Bibles had been distributed by Mr. Wheelwright, who has done so much in introducing the communication by steam along the western coast of South America.

The fruitful plain or vega of Aconcagua, in width from one to six miles, extends, to the west, some twenty miles to the ocean, and is lost in the other direction in the mountains; it is watered by streams, and covered with farm-houses and hamlets, surrounded by trees and vineyards. One feature of this plain is that the mountains seemed to sink into it as if it were into the ocean. In some cases the line was so well defined, that one foot could be placed on the plain and the other on the base of a mountain rising 6000 or 7000 feet high.

Captains King and Fitzroy have calculated the height of the peak Tupongati several hundred feet above Chimborazo. The surrounding mountains, though from 10,000 to 12,000 feet high, and much nearer, sink into insignificance when compared with it.

The ridges on the northern side of the valley are lofty and precipitous, exhibiting the columnar structure more distinctly.

On the second cuesta the party were gratified by witnessing the mode in which the Chilians capture the wild horses. A party of four or five horsemen with about twenty dogs, formed an extended crescent, driving the wild horses towards the river with shouts. All were armed with the lasso, which was swinging over their heads, to be in readiness to entrap the first that attempted to break through: the dogs serving with the riders to head the wild horses in. They continued to advance, when suddenly a horse, at furious speed, broke the line, passing near one of the horsemen, and for a moment it was thought he had escaped; the next he was jerked round with a force that seemed sufficient to have broken his neck, the horseman having the moment the lasso was thrown turned round and braced himself for the shock. The captured horse reared and plunged furiously. After becoming somewhat worn out, he was suffered to run, and again suddenly checked. This was repeated several times, when another plan was adopted. The dogs were set on him, and off he went at full run, in the direction of another horseman, who threw his lasso to entangle his legs and precipitate him to the ground. The dogs then attacked him, he leapt up, started again, and was in like manner brought to a stand; he at length became completely exhausted, and stood still quite tamed. The shouts of the men, the barking of the dogs, and the galloping of the horses, formed an extremely exciting scene.

Crossing the streams on returning was attended with some danger ; for, owing to their rapidity and depth, they were near sweeping the horses off their legs. They supped afterwards on a *casuela*, a sort of Chilean chowder, with a plentiful supply of garlic, onions, Chile pepper, &c. It is one of the favourite dishes of the country. In three days' ride they had passed over about sixty miles ; the highest temperature experienced was 65·5 deg., the lowest 35·7 deg. At the rancho, where they stopped for the night, the temperature fell 20·5 deg. in three hours.

They passed the nights with the usual annoyance in most houses in Chile, for fleas were abundant.

Copper Mines of San Felipe.—San Felipe de Aconcagua stands about fifteen miles from the foot of the Andes, and the mountains are seen from thence in all their grandeur.

On arriving at San Felipe they proceeded to the house of Mr. Henry Newman, an Englishman engaged in mining operations, to whom they had letters. Mr. Newman was not at home, but his lady, a native of Chile, treated them with great kindness and attention. She made them acquainted with an American, a Mr. Chase, who happened to be on a visit there from Santiago. He had been in Chile since the failure of the expedition of Carrera, when he, with several of his companions, settled in Chile, and afterwards engaged in mining operations. He had several times amassed a large property, and as often lost it by the revolutions that had taken place in the country. He is now engaged in working a silver mine in the vicinity of Santiago, and attempting the German process of smelting, as there are vast quantities of ore, containing a large per centage of silver, which have hitherto been neglected, from the impracticability of separating the silver by the usual method. There is now only one survivor from among the thirty persons who settled in Chile with Mr. Chase. From his operations he expects in a few years to realize a large fortune.

The town of San Felipe is laid out in the form of a square, surrounded by extensive *alamedas*, which are planted with Lombardy poplars. Mr. Newman estimated the population at from 12,000 to 13,000. In the centre of the town is a large open square, one side of which is occupied by the town-hall and municipal offices. Opposite are the church and barracks, and the remaining sides are occupied with shops and private dwellings. The houses are all of one story, and well built. The better class of houses stand some distance back from the street, and are decorated with paintings in fresco on the walls. Roses and jessamines are seen in every court-yard, and the gardens are filled with various fruits, apples, peaches, pears, grapes, pomegranates, oranges, lemons, and quinces ; the latter are remarkably fine, and in great plenty. The houses, as in other parts of Chile, have no fire-places, in lieu of which they use *brazeros*, or pans of live coal. Here they manufacture the *acida* and *aguardiente* of the

country. The process is carried on in a large court behind the house. The grapes are brought in large baskets, or hand-barrows, made with poles and raw hide, and are emptied in heaps under an open shed. On several small boards the grapes are strewed, and separated from the stalks by rolling them rapidly in their hands, the grapes falling along the boards, which are inclined into a large vat, where they are trodden out by men. The juice runs off through a rude strainer at one end into large earthen jars; the residuum is from time to time taken out of the vat, and placed on a platform, when more juice is expressed, by laying boards and heavy stones upon it. That part which is intended for wine, the "must," is poured into earthen jars, where it undergoes fermentation, and a small quantity of brandy, or the *aguardiente* of the country, is added to give it body. The *chicha* is made by boiling down the grape-juice, after fermentation, for several hours over a slow fire. After this process it is put in enormous earthen jars, containing sixty to 120 gallons, which are covered over, and tightly closed. The portion not required for consumption is afterwards distilled with the sediment into *aguardiente*. The stills are nothing more than a number of large earthen pots, holding from eighty to 100 gallons, placed in the ground over a long narrow oven, with, in place of a worm, a straight pipe of copper, about twenty feet long, inserted into each pot or jar, and for condensation, a stream of water from the river passes over these pipes. All the agricultural implements are equally primitive. The ploughs are nothing more than a crooked stick, with the share-end pointed, and hardened by charring. They, however, with rude culture, raise large crops.

Mr. Newman having returned home, enabled them to see the mines, and provided them horses and mules, in order that their own might recruit for their return journey. The temperature at San Felipe varied, between noon and 10 P.M., from 63 deg. to 49 deg. The night was remarkably clear and fine.

The next morning they started for the mines, which are near the summit of the first Cordillera, on the Mendoza road, and about 3000 feet above the level of the sea.

In the valley are the ranchos, called La Vega of Jaquel. This is the principal smelting-place, the ore being brought down by mules from the foot of the mountain, down whose sides it is thrown from the mines. The descent is about 2000 feet, and very steep.

It took about thirty seconds for the ore to descend. The face of the mountain is worn quite smooth by the weight and friction of the ore thrown down.

Mr. Newman had some time before experienced great loss by the burning of his whole establishment, excepting two buildings. Besides the loss of buildings, a large quantity of machinery imported from England was destroyed.

On reaching the mines, they changed their boots for raw-hide shoes, such as

are used by the miners, in order to insure a safer footing. They entered the principal gallery, which was about seven feet high and five broad, excavated for about twenty yards horizontally; it then divided into several branches, and these again into others, from fifteen to twenty yards in length.

The greatest width of any one gallery was about thirty feet. The mountain has been penetrated horizontally, for nearly 400 feet, in the direction of north-east to east-north-east, as the veins run, and vertically to a depth of 150 feet. Each person was provided with a tallow candle stuck in the end of a split stick six feet long, and caution was given not to lose sight of the guide.

They descended by notched posts.

The light of the numerous candles, brought forth on the walls of the galleries all shades of green, blue, yellow, purple, bronze, &c., of a metallic lustre. The heat of so many candles rendered the temperature very oppressive. The course of labour in the mines is rude. A clumsy pick-axe, a short crowbar, a stone-cutter's chisel, and an iron hammer of twenty-five pounds' weight, were the tools. The hammer is only used when the ore is too high to be reached with the pick or crowbar. The miners, from the constant exercise of their arms and chest, have brawny figures. When the ore is too tough to be removed by the ordinary methods, they blast it off in small fragments.

The ore is brought to the mouth of the mine on the backs of men, in raw hide sacks, which contain about one hundred pounds. Whenever a sufficient quantity to load a drove of mules is extracted, it is thrown down the mountain side, and then carried to the furnace at Jaquel. Seventeen miners were employed: previously the number was one hundred. Whenever a richer vein was struck a larger number were employed, who could always be easily obtained by foreigners, the natives preferring to work for them, as, whatever the profits or losses may be, they were sure of being regularly paid. The wages are from three to four dollars per month, with food. They draw a third of their pay on the last Saturday of every month, and full payment is made twice a year. They are supplied in part of wages, with clothing and other necessities, out of which the agent makes a profit.

The Chilean government prohibits spirituous liquors to be brought within a league of any mine, under a severe penalty, which is strictly enforced. The cost of the maintenance of each workman is not great; they are allowed for breakfast four handfuls of dried figs, and the same of walnuts: value about three cents. For dinner they have bread, and fresh beef or pork. Sugar and tea they find themselves. The supply of water for the miners has to be brought up the mountains at considerable expense.

The miners' huts are the last habitations on the Chilean side of the Andes.

Chile abounds with volcanic mountains, but few of them are in an active state

of eruption, which may account for the frequency of earthquakes. The peak of Tupongati is the only one in activity in this section.

Santiago contains about 60,000 inhabitants, and is one of the few South American capitals, perhaps the only one, that is increasing in wealth and population. It has various private seminaries for both sexes, a national institute or college, on a liberal footing, an extensive hospital, a medical college, and a military academy. The Congress meets on the 1st of June every year, when the president delivers his message.

Valparaiso numbers 30,000 inhabitants, and is the most flourishing sea-ports in South America. Its population has quintupled within the last twenty years, and it is rapidly advancing in every improvement, growing out of an increasing foreign commerce, and the enterprise of its inhabitants, fostered and encouraged as they are by the government.

The mining districts are to the north, and the grain country to the south. Extensive flour-mills are now in work in Concepcion and its neighbourhood: the machinery is brought from the United States.

There is very little variation in the climate. During what is called the winter the thermometer occasionally falls for a few hours to 52 deg., but the mean of it throughout the year, at mid-day, would be 65 deg. In the evening and morning, it is at 60 deg.

CHAPTER XXVII.

PATAGONIA AND THE SOUTHERN ISLANDS.

PATAGONIA, together with the islands of the straits south to Cape Horn, extends from the mouth of the Cusu Leubu, or Rio Negro, in 39 deg. south latitude to Cape Horn (55 deg. 54 min. south latitude), a distance of about 1180 miles, and between 64 deg. and 76 deg. west longitude; in breadth between 420 and 200 miles. On the north it is separated from the Argentine Republic by the River Negro. On all other sides it is surrounded by the ocean.

Along the Pacific the Patagonian Andes occupy the surface from thirty to forty miles from the sea. The climate of this region is excessively wet, and the rains fall during the greater part of the year. Strong westerly gales occur frequently. The rains prevent both excessive cold or heat. The mountain region is generally covered with forests except along parts of the shores of the Pacific. The vegetation is luxuriant north of 48 deg., and stunted further south. The remainder of Patagonia consists chiefly of plains, which slope gradu-

ally from the Andes towards the Atlantic, and which, owing to the want of rain, are described, but not on what we consider good authority, as little else than a desert. Gales from the west prevail; the winters are severe; shrubs and coarse grass constitute the principal vegetation.

The Patagonians live on their horses and on the wild cattle, which abound in the northern districts, and on the guanaco, caviar, armadillos, and emu, which abound in the more fertile pastures. There are pumas and wolves, and along the coast of the Atlantic seals and sea-lions. Fish is abundant in the inlet of the western coast; salt-lakes, or lagoons, are found along the eastern shores.

The plains on the continent, as well as on King Charles's Southland, are inhabited by the Patagonians, a race of men described as of enormous size, though modern travellers have not found them to be such giants as they were described by some older voyagers; their average height seems to be about six feet or somewhat more. They lead a nomadic life, and travel rapidly from one extremity of the country to the other. They are divided into four tribes: the Chulian, living near the Andes, the Moluche, who occupy the interior, and the Pehuelche, who live along the coast. The Tehuelhet inhabit the plains adjacent to the Straits of Magalhaens.

The south mountain region is inhabited by the Fuegians, a race of a short stature varying in height from four feet ten inches to five feet six inches. They live by fishing in the inlets, and pass most part of their lives in small canoes.

Of the south coasts of Patagonia, and its harbours, we have condensed the following sketches from the narrative of the United States Exploring Expedition.

"The passage through the Straits of Le Maire gives a vessel a much better chance of making the passage round the Cape quickly. No danger exists here that I know of. A vessel with the tide will pass through in a few hours. As for the 'race and dangerous sea,' I have fully experienced it in the *Porpoise* on the side of Staten Land; and am well satisfied that any vessel may pass safely through it, at all times and in all weathers, or if not so disposed, may wait a few hours until the sea subsides and the tide changes. We were only three hours in passing through. We entered the straits with studding sails set, and left them under close-reefed topsails.

"The coast of Terra del Fuego presents the same general character throughout, of high, broken, and rugged land, which appears of a uniform elevation of about 1000 or 1500 feet, with here and there a peak or mountain covered with snow, rising to some 4000 or 5000 feet. The whole wears a sombre and desolate aspect. It may be said to be iron-bound, with many high and isolated rocks, that have become detached from the land apparently by the wear of ages. Numerous unexpected indentations occur all along the coast, many of them forming harbours for small vessels, and some of them very safe ones.

"The channels formed by the islands are deep, with no anchorage except in the coves near the rocks; but a vessel is generally safe in passing through, as there are no dangers but those which show themselves, and wherever rocks are, kelp will be found growing upon them. To pass through the kelp without previous examination is not safe. It borders all the shores of the bays and harbours, and effectually points out the shoal water.

"Nassau Bay forms a large indenture in the southern coast of Terra del Fuego, a few miles to the northward of Cape Horn ; it is about thirty miles east and west, by eight miles north and south, and is somewhat protected from the heavy seas by the Hermit Islands. Around the bay are found some harbours sheltered by small islands, and surrounded by the precipitous rocky shores, with occasionally a small ravine forming a cove, into which streams of pure water discharge themselves, affording a safe and convenient landing-place for boats.

"In passing the Cape the weather was delightful. We sailed within two miles of this dreaded promontory, and could not but admire its worn and weatherbeaten sides, which have so long been invested with all the terrors that can beset sailors. Here we first encountered the long swell of the Pacific, but there was scarcely a ripple on its surface. Although the landscape was covered with snow, the lowest temperature we had yet experienced was 40 deg. Fahrenheit.

"We continued beating into the passage between the Hermit Islands and False Cape Horn, and found great difficulty in passing Point Lort, from the very strong outward set of the tide, which we found to run with a velocity of five miles an hour. We were not able to make way against it, though the log gave that rate of sailing. After beating about in this channel a long and dark night, with all hands up, we made sail at daylight, and on the 17th of February, 1839, at half-past six A.M., anchored in Orange Harbour. Here we found the *Relief* and tenders all well.

"The *Relief* had an opportunity of proving the positions and sailing directions of Captain King, R.N., and it affords me great pleasure to say that all his observations tend to show the accuracy of the positions, and the care with which that officer has compiled his sailing directions.

"No navigator frequenting this coast or passing round Cape Horn should be without the sailing directions for East and West Patagonia, and he will prize them as highly valuable after he has once used them. The admirable surveys and exertions of this officer and those under him on this coast entitle him to the rewards of his country, as well as the thanks of the civilised world.

"On the morning of the 22nd, at daylight, the natives appeared on the beach, shouting to them to land. They were naked, with the exception of a guanaco-skin, which covered them from the shoulders to the knees.

"The party of natives were seventeen in number, and with a few exceptions they were above the European height. The chief, who was the oldest man among them, was under fifty years of age, and of comparatively low stature ; his son was one of the tallest, and above six feet in height. They had good figures and pleasant-looking countenances, low foreheads, and high cheek-bones, with broad faces, the lower part projecting ; their hair was coarse, and cut short on the crown, leaving a narrow border of hair hanging down ; over this they wore a kind of cap or band of skin or woollen yarn. The front teeth of all of them were very much worn, more apparent, however, in the old than in the young. On one foot they wore a rude skin sandal.

"Many of them had their faces painted in red and black stripes, with clay, soot, and ashes. Their whole appearance, together with their inflamed and sore eyes, was filthy and disgusting. They were thought by the officers more nearly to approach to the Patagonians than any other natives, and were supposed to be a small tribe who visit this part of Terra del Fuego in the summer months ; they were entirely different from the Petcherais, whom we afterwards saw at Orange Harbour.

"None of their women or children were seen, but they were thought to be not far distant in the wood, as they objected to any of our people going towards it, and showed much alarm when guns were pointed in that direction. They seemed to have a knowledge of fire-arms, which they called *eu*, or spirit ; and *kai-eu*, which they frequently uttered with gestures, was thought to indicate their Great Spirit, or God.

"They had little apparent curiosity, and nothing seemed to attract or cause them surprise ; their principal characteristic seemed to be jealousy. Though they are a simple race, they are not wanting in cunning ; and it was with great difficulty that they could be prevailed upon to part with their bows and arrows in trade, which they, however, did, after asking permission from their chief ; this was always necessary for them to obtain

before closing a bargain. They have had communication frequently before with Europeans; pieces of many articles of European manufacture were seen in their possession, such as glass beads, &c. They refused tobacco, whiskey, bread, or meat, and were only desirous of getting old iron, nails, and pieces of hoop-iron.

"Their food consists principally of fish and shell-fish. Their fishing apparatus is made of the dorsal fin of a fish, tied to a thin slip of whalebone, in the form of a barb, this serves as a hook, and with it they obtain a supply of this food. Their arms consisted altogether of bows and arrows. The natives had the common dog, which they seemed to prize much."

ORANGE HARBOUR (after doubling Cape Horn) is on the western side of Nasau Bay, separated and protected from it by Burnt Island. It is nearly land-locked, and is the safest harbour on the coast. The hills on each side, after several undulations, rise into conical peaks, and the naked rock is everywhere broken into a jagged outline, with no plants to soften its harshness. Every thing has a bleak, wintry appearance, and is in excellent keeping with the climate; yet the scenery about it is pleasing to the eye, bounded on all sides by undulating hills which are covered with evergreen foliage. Distant mountains, some of which are capped with snow, shooting up in a variety of forms, seen beyond the extensive bays, form a fine background. From the ships at anchor, the hills look like smooth downs, and if it were not for the inclemency of the weather, the landscape would be divested of its dreariness.

The hills are covered with forests of beech, birch, willow, and winter-bark. Some of the trees are forty or fifty feet high, having their tops bent to the north-east by the prevailing south-west winds. They are remarkably even as to height, having more the look, at a distance, of heath than of forest trees.

The whole coast has the appearance of being of recent volcanic rocks, but investigations prove the contrary. They nowhere found cellular lava, pumice, or obsidian, nor was there any granite or other primitive rock seen. The rock was trachytic, or of trap formation, apparently having undergone more or less action by fire.

The natives were at first very shy, but they became more sociable and confiding.

Before the squadron departed from Orange Harbour, a bark canoe came alongside with an Indian, his squaw, and four children. The tribe to which they belonged is known by the name of the Petcherai Indians. They were entirely naked, with the exception of a small piece of seal-skin, sufficient to cover one shoulder, and generally worn on the side from which the wind blows.

They were not more than five feet high, of a light copper colour, concealed by smut and dirt, particularly on their faces, which they marked vertically with charcoal. They have short faces, narrow foreheads, and high cheek-bones. Their eyes are small, black, the upper eyelids in the inner corner overlapping the under one. Their nose is broad and flat, with wide nostrils, mouth large, teeth white, large, and regular. The hair long, lank, and black, hanging over

the face, and covered with white ashes, which gives them a hideous appearance. The whole face seemed compressed. Their bodies were remarkable from the development of the chest, shoulders, and vertebral column; their arms long, and out of proportion; their legs small, and ill-made, with little difference between the size of the ankle and leg; and, when standing, the skin at the knee hanging in a loose fold. In some, the muscles of the leg appeared almost wanting, with very little strength, owing to their constant sitting posture, both in their huts and canoes. It was impossible to fancy any thing in human shape more filthy, or a more ill-shapen and ugly race. They have little or no idea of the relative value of articles, even of those that one would suppose were of the utmost use to them, such as iron and glass-ware. A glass-bottle broken into pieces, was valued as much as a knife. Red flannel torn into stripes, pleased them more than in the piece; they wound it round their heads, as a kind of turban.

The children were small, and nestled on some dry grass in the bottom of the canoe. The woman and eldest boy paddled the canoe, the man being employed to bale out the water and attend to the fire, which is always carried in the bottom of the canoe on a few stones and ashes, which the water surrounds.

Their canoes were constructed of bark, very frail, and sewed with shreds of whalebone, seal-skin, and twigs. They were sharp at both ends, and kept in shape and strengthened by stretchers lashed to the gunwale.

These Indians seldom venture outside the sea-weed, by the aid of which they pull their canoes along; and their paddles are so small as to be of little use unless it is calm.

Their huts were generally found close to the shore, at the head of some small bay, and sheltered from the prevailing winds. They were built of boughs or small trees, stuck in the earth, and brought together at the top, bound by bark and twigs. Smaller branches were interlaced, forming a wicker-work, and on this grass, turf, and bark were laid, rendering the hut warm, and these sufficed to exclude the wind and snow, though not the rain. The usual dimensions of these huts were seven or eight feet in diameter, and about four or five feet in height, with an oval hole to creep in at. The fire was made in a small excavation in the middle of the hut. The floor was of clay, apparently kneaded. Opposite the door of each hut was a conical pile of mussel and limpet shells, nearly as large as the hut itself.

These natives were never seen but in their huts or canoes. The impediments to communication by land are great, in the mountainous and rocky country, intersected with deep and impassable inlets, in most places bounded by abrupt precipices. On the hills, as well as in the plains and valleys, the soil is nearly a quagmire. The forest is impeded by a dense undergrowth of thorny bushes.

They appeared to live in families, and not in tribes, and do not seem to acknowledge any chief.

"On the 11th of March three bark canoes arrived, containing four men, four women, and a girl about sixteen years old, four little boys and four infants, one of the latter about a week old, and quite naked. The thermometer was at 46 deg. Fahrenheit. They had rude weapons, viz. slings to throw stones, three rude spears, pointed at the end with bone, and notched on one side with barbed teeth. With this they catch their fish, which are found in great quantities among the kelp. Two of the natives were induced to come on board, after they had been alongside for upwards of an hour, and received many presents, for which they gave their spears, a dog, and some of their rude native trinkets. They did not show or express surprise at any thing on board, except when seeing one of the carpenters engaged in boring a hole with a screw-auger through a plank, which would have been a long task for them. They were very talkative, smiling when spoken to, and often bursting into loud laughter, but instantly settling into their natural serious and sober cast.

"They were found to be great mimics, both in gesture and sound, and would repeat any word of our language, with great correctness of pronunciation. Their imitations of sounds were truly astonishing. One of them ascended and descended the octave perfectly, following the sounds of the violin correctly. It was then found he could sound the common chords, and follow through the semitone scale, with scarcely an error. They have all musical voices, speak in the note G sharp, ending with the semitone A, when asking for presents, and were continually singing.

"Their mimicry became at length annoying, and precluded our getting at any of their words or ideas. It not only extended to words or sounds, but actions also, and was at times truly ridiculous. The usual manner of interrogating for names was quite unsuccessful. On pointing to the nose, for instance, they did the same. Any thing they saw done they would mimic, and with an extraordinary degree of accuracy. On these canoes approaching the ship, the principal one of the family, or chief, standing up in his canoe, made a harangue. Although they have been heard to shout quite loud, yet they cannot endure a noise, and when the drum beat, or a gun was fired, they invariably stopped their ears. They always speak to each other in a whisper. The men are exceedingly jealous of their women, and will not allow any one, if they can help it, to enter their huts, particularly boys.

"The women were never suffered to come on board. They appeared modest in the presence of strangers. They never move from a sitting posture, or rather a squat, with their knees close together, reaching to their chin, their feet in contact, and touching the lower part of the body. They are extremely ugly. Their hands and feet were small and well-shaped, and from appearance they are not accustomed to do any hard work. They appear very fond, and seem careful of their young children, though on several occasions they offered them for sale for a trifle. They have their faces smutted all over, and it was thought, from the hideous appearance of the females, produced in part by their being painted and smutted, that they had been disfigured by the men previous to coming alongside. It was remarked, that when one of them saw herself in a looking-glass, she burst into tears, as Jack thought, from pure mortification.

"The men are employed in building the huts, obtaining food, and providing for their other wants. The women were generally seen paddling their canoes.

"When this party of natives left the ship and reached the shore, the women remained in their canoes, and the men began building their temporary huts; the little children were seen capering quite naked on the beach, although the thermometer was at 40 deg. On the hut being finished, which occupied about an hour, the women went on shore to take possession of it. They all seemed quite happy and contented.

"Before they left the ship, the greater part of them were dressed in old clothes, that had been given to them by the officers and men, who all showed themselves extremely anxious 'to make them comfortable.' This gave rise to much merriment, as Jack was

not disposed to allow any difficulties to interfere in the fitting. If the jackets proved too tight across the shoulders, which they invariably were, a slit down the back effectually remedied the defect. If a pair of trousers was found too small around the waist, the knife was again resorted to, and in some cases a fit was made by severing the legs. The most difficult fit, and the one which produced the most merriment, was that of a woman to whom an old coat was given. This she concluded belonged to her nether limbs, and no signs, hints, or shouts, could correct her mistake. Her feet were thrust through the sleeves, and after hard squeezing she succeeded in drawing them on. With the skirts brought up in front, she took her seat in the canoe with great satisfaction, amid a roar of laughter from all who saw her.

"Towards evening, Messrs. Waldron and Drayton visited their huts. Before they reached the shore, the natives were seen making a fire on the beach, for their reception, evidently to avoid their entering their huts.

"On landing, one of the men seemed anxious to talk with them. He pointed to the ship, and tried to express many things by gestures; then pointed to the south-east, and then again to the ship, after which clasping his hands, as in our mode of prayer, he said, 'Eloah, Eloah,' as though he thought we had come from God.

"After a little time they gained admittance to the hut. The men creeping in first, squatted themselves directly in front of the women, all holding out the small piece of seals-skin to allow the heat to reach their bodies. The women were squatted three deep behind the men, the oldest in front, nestling the infants.

"After being in the hut, Mr. Drayton endeavoured to call the attention of the man who had made signs to him before entering, to know whether they had any idea of a Supreme Being. The same man then put his hands together, repeating as before, 'Eloah, Eloah.' From his manner it was inferred that he had some idea of God or a Supreme Being.

"Their mode of expressing friendship is by jumping up and down. They made Messrs. Waldron and Drayton jump with them on the beach, before entering the hut, took hold of their arms, facing them, and jumping two or three inches high from the ground, making them keep time to a wild music of their own.

"All our endeavours to find out how they ignited their fire proved unavailing. It must be exceedingly difficult for them to accomplish, judging from the care they take of it, always carrying it with them in their canoes, and the danger they thus run of injuring themselves by it.

"Their food consists of limpets, mussels, and other shell-fish. Quantities of fish, and some seals, are now and then taken among the kelp, and with berries of various kinds, and wild celery, they do not want. They seldom cook their food much. The shell-fish are detached from the shell by heat, and the fish are partly roasted in their skins, without being cleaned.

"When on board, one of them was induced to sit at the dinner-table; after a few lessons, he handled his knife and fork with much dexterity. He refused both spirits and wine, but was very fond of sweetened water. Salt provisions were not at all to his liking, but rice and plum-pudding were agreeable to his taste, and he literally crammed them into his mouth. After his appetite had been satisfied, he was in great good humour, singing his 'Hey meh leh,' dancing, and laughing. His mimicry prevented any satisfactory inquiries being made of him relative to a vocabulary.

"Some of the officers painted the faces of these natives, black, white, and red: this delighted them very much, and it was quite amusing to see the grimaces made by them before a looking-glass.

"One of these natives remained on board for upwards of a week, and being washed and combed, he became two or three shades lighter in colour. Clothes were put on him. He was about twenty-three years of age; and was unwell the whole time he was on board, from eating such quantities of rice, &c. His astonishment was very great on attending divine service. The moment the chaplain began to read from the book, his eyes were riveted upon him, where they remained as long as he continued to read. At the end of

the week he became dissatisfied, and was set on shore, and soon appeared naked again. It was observed, on presents being made, that those who did not receive any began a sort of whining cry, putting on the most doleful-looking countenances imaginable.

"They are much addicted to theft, if any opportunity offers. The night before they left the bay, they stole and cut up one of the wind-sails, which had been scrubbed and hung up on shore to dry.

"Although we had no absolute proof of it, we are inclined to the belief that they bury their dead in caves.

"There is a black-coloured moss that covers the ground in places, giving it the appearance of having been burnt. Many small ponds are met with, as though the peat had been dug from the place, and the holes filled with water. There is great plenty of scurvy-grass and wild celery close to the beach.

"At Orange Harbour the tide was found to have four feet rise and fall. High water, full and change, at 4 P.M. Among the Hermit Islands it seems to be affected by the winds in the offing. The flood sets to the east."

Passing Cape Horn.—Captain Wilkes says,

"I am inclined to believe that as much depends upon the vessel and the manner in which she is navigated as the route pursued when the Cape is passed close to, or given a good berth; the object of all is to pass it as quickly as possible, and taking into consideration the difficulties to be incurred from boisterous weather, heavy seas, and ice, it is impossible to lay down any precise rule; that course which appears most feasible at the time ought to be adopted; keeping, however, in view, that there is no danger to be apprehended in navigating on the western coast of Terra del Fuego, as the current sets along its coast, and it is perfectly safe and practicable to navigate it as far as Cape Pillar. The great difficulty exists in passing the pitch of the Cape; there is none afterwards, in getting to the westward. On the coast the wind seldom blows long from the same quarter, but veers from south-west to north-west; the gales generally begin at the former quarter and end at the latter. Previous to the south-west gales, it would, therefore, in all cases, be advisable, when indications of their occurrence are visible (which are known by the banks of cumuli in that quarter, some twenty-four hours previously), to stand to the southward and westward in preference, with as much sail as can well be carried, that when the change occurs, you may be ready to stand on the other tack to the northward. One thing every navigator ought to bear in mind, that it requires all the activity and perseverance he may be possessed of to accomplish it quickly.

"On the 20th we took our final leave of these waters, and on the 21st lost sight of land, passing to the northward of the island of Diego Ramieres.

"Immediately after leaving Orange Harbour, dysentery made its appearance on board the *Vincennes*, and ran through the whole ship's company. Some of the officers were also affected. It proved of a very mild type, and readily yielded to medical treatment. Upon our arrival at Valparaiso, it had entirely disappeared. The medical officers were unable to account for it, the health of the ship's company having been very good during our stay at Orange Harbour. It was not thought to be owing to the water, as they had been using it for two months without any bad effect, but I think it must be imputed to the cold and wet we experienced in the first part of the passage.

"On the 15th we made the land off Valparaiso, and before noon anchored in the bay."

CHAPTER XXVIII.

BUENOS AYRES, OR ARGENTINE REPUBLIC.

THE federal republic, called on its formation the *Argentine Republic*, including Monte Video and Paraguay, named also the provinces of La Plata, from the wide estuary of that name, lies between 21 deg. and 41 deg. south latitude, and 53 deg. 30 min. and 72 deg. west longitude. Along the meridian of 66 deg. west longitude they extend from south to north about 1120 miles, and in the parallel of 34 deg. south latitude, about 880 miles from east to west. On the south, the River Cusu Leubu, or Rio Negro, forms the boundary line between these provinces and Patagonia. On the east they are bounded by the Atlantic Ocean from the mouth of the Rio Negro north to Brazil, which extends along the northern line as far west as the River Paraguay (58 deg. west longitude), and west of that river by the republic of Bolivia. The principal range of the Andes extends along the western frontier separating the Argentine Republic from Bolivia and Chile.

When these countries became independent of Spain, they formed a federal union. Since that time they have broken up into separate republics.

The REPUBLIC of BUENOS AYRES extends, it may be said, along the Atlantic Ocean from Rio Negro on the south, to the mouth of the Rio de la Plata; and along the whole southern shores of its estuary, and also along the southern banks of the Paranà as far as the Arróyo del Medio, a river which separates it from Santa Fé. The western boundary runs from the mouth of the River Neposta, in a north-eastern direction to the western extremity of the Sierra del Vulcan, and thence it continues north to about 61 deg. longitude to the fortress of Cruz de Guerra (35 deg. 30 min. south latitude), and thence to the fortress of Melinqué (33 sec. 42 min. south latitude). This boundary separates Buenos Ayres from the territories of the Southern Indians. A line from Melinqué to the Arróyo del Medio, forms the boundary-line between the republics of Buenos Ayres and Santa Fé. The area within these boundaries is estimated at about 75,000 square miles. But this estimate is a vague calculation, and the limits of Buenos Ayres, from the disturbed state of the country, are not settled.

The northern part includes a portion of the Eastern Pampas; the surface of the whole country is nearly flat, diversified by slight undulations. A very large portion of this state has a fertile soil for arable culture or pasturage; a tract south of the Rio Salado is low and covered with swamps, or lakes. The most southern portion comprehends the Sierra del Vulcan, and the south-eastern extremity that of Ventana. The plain between these ranges is said to be fit

for arable culture. No part of it is cultivated. The climate of the northern portion is mild; ice is seldom formed. In summer the thermometer rises to about 90 deg. The north winds which prevail are as disagreeable as the sirocco of Italy. The south-western winds, or pamperos, blow furiously, sometimes accompanied by thunder and lightning. In the southern districts the climate is nearly as severe as in above 50 deg. north latitude in Europe, but it is healthy. Both regions have sufficient rain for vegetation: the rains fall most abundantly before the setting in of the cold weather in April and May.

Cattle and agricultural products form the chief sources of wealth. The number of black cattle that pasture on the pampas is stated to exceed one million. Hides, hair, and horns are exported, and also tallow, and jerked beef. The hides weigh from fifty to sixty pounds on an average. Horses are numerous, and, as well as mules and asses, are exported. Of late the breed of sheep has been improved, and wool constitutes an article of export. The cultivation of the ground was formerly so much neglected, that corn and flour were imported, but some wheat has been exported to some amount.

The following sketch of the Rio Negro, and the southern region of Buenos Ayres is new, and condensed from the narrative of the United States Expedition:

The *Guachos* are generally well made, tall, muscular, black eyes, have large mustaches, and small feet; dress, red striped shirt, white fringed sleeves, and large trousers of scarlet cloth. On the head was worn a red conical cap, surmounted by a tassel.

Their riding boots or leggings are made of the hide from the leg of a horse. This is stripped off and put on the leg while yet green, where it is suffered to dry, and remain until worn out. They fit very closely to the foot, like a stocking. The two largest toes of each foot were uncovered, for the convenience of putting them into the stirrup, which is only large enough to admit them. A long knife in the girdle completes the dress.

The Rio Negro is navigable for boats to the village of Chicula, 200 miles from its mouth.

The distance across the country to Buenos Ayres is but 500 miles, yet it requires fifteen days to communicate with it; the governor had received no advices or information for the last two months from that place. The route is very uncertain, owing to the hordes of hostile Indians.

Grain, fruit, and vegetables thrive well, and with proper industry might be produced in abundance.

The climate is delightful, and cold weather is seldom felt, although ice has occasionally been seen a quarter of an inch in thickness.

Bullocks and horses are the principal articles of trade; indeed, they constitute the legal tender of the country. The former are worth from five to ten dollars, according to age; wild horses, two or three dollars, and if broken to the saddle, ten or fifteen dollars.

The tariff of duties is the same as at Buenos Ayres, but the late reduction of thirty-three per cent during the blockade did not extend to this place.

The Indians that are accustomed to visit this place (Carmen) for the purpose of war or trade, are of four different tribes, viz.: Pampas, Ancases, Tehuiliches or Teheulehes, and Chilenos. The two former occupy the territory to the north of the Rio Negro as far as the Rio Colorado. The Tehuiliches are from the mountains to the south, and the Chilenos from the south-west.

During the infancy of the settlement, and until of late years, these Indians were extremely troublesome, making descents upon the place, and ravaging the outposts, waylaying all who were not on their guard, killing them, and retreating rapidly on their wild steeds, with their booty, to the pampas and mountains. The Spaniards frequently retaliated, and by the superiority of their arms and discipline, inflicted summary punishment on them. The last attack of the Indians was made in 1832, when they met with such an overwhelming defeat, that they have not ventured to make another; yet the garrison is always kept in anxiety for fear of attacks.

The weapons usual in their warfare are a long lance and the *ballos*, such as is used in taking the ostrich and throwing cattle, which they use with great dexterity. This consists of a thong of hide, four feet in length, with a leaden ball at each end, which the horseman grasps in the middle, and gives the balls a rotary motion by whirling them above his head, then dashing on to the attack, he throws it when within range with unerring aim, and seldom fails to disable his enemy. The Indians who are most feared are the *Chilenos*. The *Tehuiliches*, notwithstanding their immense size, are considered little better than cowards.

All the information gained here tended to confirm the general impression that the *Tehuiliches* or *Patagonians* are above the ordinary height of men, generally above six feet; and the minister asserted that he had often seen them above seven English feet. We had not any personal opportunity to verify this statement, the Indians being only in the habit of visiting this post once a year, to obtain supplies, viz., in the month of March, at which time a vessel usually visits the place.

The few Indians who inhabit the huts or *toldos* on the opposite side of the river, are converted, and are termed *Indios Mansos*; they are a mixture of all the tribes, and so much changed in habits and dress from their former condition and mode of life, that an accurate idea could not be formed of their natural character. They were none of them above the middle height; their limbs were usually full and well formed; their complexion a brownish copper, with coarse straight black hair, growing very low on the forehead; this is suffered to grow long, and hangs down on both sides of the face, adding much to the wildness of their appearance. Their foreheads are low and narrow towards the top, their eyes small, black, and deep set. Some were observed with their eyes set Chinese-like. The resemblance was somewhat increased by the width of the face, which was a particular characteristic. The nose is usually a little flattened at the root, and wide at the nostrils, the lips full, and the chin not prominent. The expressions of their countenance betoken neither intellect nor vivacity. The men were generally decked out in tawdy finery, partly after the Spanish fashion; the women had only the *chilipa* to cover their nakedness.

The *Chilenos*, from the western side of the continent, are predatory bands of the *Araucanian* nation.

The *Peulches*, including the *Pampas* and *Tehuiliches*, Falkner, in his account of this country, describes as inhabiting the portion south of the *Rio de la Plata*, and to the east of the *Cordilleras*; they are scattered over the vast plains of the interior. Those to the north of the *Rio Colorado* are generally known under the name of the *Pampas Indians*; they call themselves *Chechehets*. Those to the south of that river are termed *Tehuiliches*; they inhabit the table-land between the *Cordilleras* and the desert plains of the coast.

The *Guachos* and *Indians* are good horsemen, being trained to ride from their infancy. Indeed, they may be said to live on horseback, and it is very seldom that they are seen to walk any distance, however short.

The ease and *nonchalance* with which a *Guacho* mounts his steed, arranges himself in the saddle, quietly trotting off, lasso in hand, to select his victim, and detach it from the herd; then the eager chase, the furious speed of the horse, the flying dress of the *Guacho*, with upraised arm whirling his lasso, the terror of the animal, the throw of the lasso, and instantaneous overthrow of the bullock, all the work of an instant, excited both admiration and astonishment.

The coast and the banks of the *Rio Negro* are composed of sand-hills, of from thirty to fifty feet in height, covered with a scattered growth of grass, which prevents the sand from blowing away. These gradually rise to the height of 100 feet, except to the

southward of the river, where the bank is perpendicular; at this height the ground stretches away in a level prairie, without a single tree to break the monotony of the scene, and affords a view as uninterrupted as the ocean.

The only verdure on the prairie is a small shrub, which, when the lower branches are trimmed off, serves a useful purpose. From an optical illusion (the effect of refraction) they appear, when thus trimmed, as large as an ordinary-sized apple-tree; and one is not a little surprised to find them, on a near approach, no higher than the surrounding shrubs, four or five feet. Shrubs are trimmed in this manner at distances of about half a mile from each other, and are used as guide-posts on the prairie.

Game is plentiful, consisting of deer, guanacoës, and caviás, cassowaries, partridges, bustards, ducks, &c. Armadillos are common, and the ostrich was frequently seen; porcupines are said also to be found. The caviás were seen running about in single file, with a sort of halting gait.

The width of the Rio Negro is less than a third of a mile; it has a rapid current, and a large body of water is carried by it to the ocean. The ordinary tide is about eight feet rise, and the spring tides fourteen feet. The current is mostly downward, although the tide is felt about ten miles above its mouth. The ebb sets off shore some three or four miles, and may be known by the discolouration of the water, which, just without the bar, is comparatively fresh. The depth at high water on the bar is two and a half fathoms, and the bar is a changing one.

No springs were observed in the vicinity, or any trace of running water, except in the river. The water from the rains collects in the depressions, and forms large ponds, covering acres of grounds, but only a few inches in depth.

The time of this visit corresponded in season to the midsummer months of the northern hemisphere, and the mean temperature was found to be 73 deg. The winters are represented as very mild; snow does fall, but it disappears in a few hours. Ice is seldom seen, though frosts appear to be frequent in the winter. January, February, March, and April, are the least tempestuous months.

The vegetation of the uplands bears the marks of long-continued droughts, in an absence of trees, and the roots of plants penetrating vertically. The stunted appearance of the shrubs, spreading from their base, their branches dense, rigid, and impenetrable, usually growing into spines; the smallness of the leaves and their texture, which is dry, coriaceous, and hardly deciduous; together with the general brown aspect of the landscape, all denote a vegetation adapted to endure or escape drought.

There was formerly some trade carried on in the Rio Negro with Boston and New York, in hides, horns, bones, and tallow, in exchange for cotton and woollen goods, hardware, crockery, boots and shoes, a few articles of furniture, spirits, and tobacco, all of which are bartered at an enormous profit. Considerable quantities of salt are shipped to Buenos Ayres. Vessels discharging or taking in a cargo, pay twelve and a half cents per ton. Vessels stopping without discharging, pay half duty; vessels for refreshments are permitted to remain twenty-five days free of duty, after that time they pay half duty. This duty includes pilotage and all other charges; but the governor seems to have the power to exact the full duty whenever he thinks proper.

El Carmen may be termed a convict settlement; for culprits and exiles are sent here from Buenos Ayres. The garrison is composed of about two hundred soldiers, principally African and Brazilian slaves brought here during the Banda Oriental war."

Industry and trade, have, during the domination of Rosas, greatly diminished.

BUENOS AYRES, the capital, is situated on the south shores of the La Plata, nearly opposite the mouth of the River Uruguay, on level ground, and several feet above the water. Vessels of moderate size may sail up the river as far as the town, but they cannot approach it on account of shoals which intervene between the shores and the deep water. The city is regularly laid out: the

streets intersect each other at right angles. Nearly all the streets are now paved with granite. The houses are low, few of them having more than one story, and the town covers at least twice the area of an European city with the same population. The public buildings which have any architectural pretensions are the churches; but most of them are unfinished. The town is badly provided with water; that which is in the wells is brackish, and those inhabitants who can afford the expense have tanks, in which the rain-water is collected from the roofs of the houses. Many of the houses have small gardens attached, and have European or United States articles of furniture. The water of the river is good, but there are no means of bringing it to the town. Water-carriers retail it to the lower classes. The population, about 80,000 souls, is composed almost entirely of the Spanish race; the number of mulattoes is small, that of the negroes still less. No manufactures are carried on. Buenos Ayres is the seat of government, has a university, an observatory, a public library, and some scientific institutions. The English and Scotch have places of worship, and a burial-place. The trade of Buenos Ayres is considerable, as it is the principal place whence the productions of the provinces of La Plata are exported to foreign markets, and through which they are provided with foreign merchandise.—(See Statistics of Buenos Ayres hereafter.)

The population of the whole province probably does not much exceed 200,000. The great disproportion between the population of the capital would be remarkable, were it not that there is not probably one acre in one thousand under arable culture: all the remainder fit for agriculture being used as pasture. The executive power is vested in the governor, or captain-general, as he is styled, who is elected for five years. He is aided by a council of ministers, appointed by himself, but responsible to the Junta, or Legislative Assembly, of the republic by whom he is elected. The junta itself consists of forty-four deputies, one-half of whom are annually renewed by popular election. But under Rosas all constitutional government has been reversed; the public press, except two vile journals under his direction, has been suppressed.

A chain of forts has been established along the western boundary-line of the province of Buenos Ayres from the Bahia Blanca to Fort Melinqué, to check the inroads of the Indians who inhabit the country west of the republic to the foot of the Andes, and frequently extend their predatory incursions to the settlements of the whites north of 35 deg. south latitude. The south-western Indian country is very little known, but it is said to be more undulated than the *pampas*. Between the Andes and the plains, there extends a hilly country from 100 to 110 miles in breadth; and an undulated country with woods, and stretches thence to the centre of the plains to the purely pasturage or *pampas* region, which extends to the country of clover, weeds, and thistles. West of Buenos Ayres, the

Guacho and his herds of wild cattle, inhabit these rich pastures. Sulphur is abundant there, and coal is said to exist ; rock salt is found.

The REPUBLIC of ENTRE RIOS, is situated between the rivers Uruguay and Paranà, west of Uruguay. On the north it is divided from the republic of Corrientes by the Mocoreta and by the Sarandi. Estimated area 32,000 square miles. The southern portion is an alluvial plain, annually inundated. To the north, the country is undulated and swampy. A considerable part is prairies, which affords good pasturage on which herds of cattle and horses abound ; hides, horns, tallow, and jerked beef, are exported. Cultivation is limited to a few places. The climate is temperate and salubrious. This republic only requires to be relieved from anarchy to become a most productive region.

BAJADA DE SANTA FÉ, the capital, on the banks of the Paranà, contains about 6000 inhabitants. Concepcion de la China, on the Uruguay, has 2000 inhabitants.

The REPUBLIC of CORRIENTES extends from the boundary-line of Entre Rios to the Rio Paranà, which separates Corrientes from the republic of Paraguay. Estimated area about 20,000 square miles. The southern portion is undulated, partly wooded, and fertile. The northern parts are swampy, and comprise the Lake Ybera. The climate is warm. Cotton, sugar, and indigo are grown. Maize is the common grain. *Seta silvestre*, a kind of silk made by a species of caterpillar, is used for making coarse stuffs. Agriculture is little attended to ; some cotton and tobacco are exported.

CORRIENTES, the capital, near the confluence of the rivers Paranà and Paraguay, it has 4500 inhabitants, and some trade.

The REPUBLIC of MISSIONES, situated between the rivers Paranà and Uruguay extends to the boundary of Brazil. Surface is undulated ; the soil is fertile. It was the principal seat of the *Misiones*, established by the Jesuits among the Guarani Indians formerly. The population once estimated at near 100,000 inhabitants, is at present about 10,000. The climate is warm ; the country produces rice, maize, tobacco, sugar, and cotton, but it is now nearly a wilderness. Estimated area about 7500 square miles. Entre Rios, Corrientes, and the Misiones constitute, geographically, one country ; and it was a descent to the ridiculous to have formed these into separate governments.

The REPUBLIC of SANTA FÉ lies on the western banks of the Paranà, and comprehends the region between that river and the Rio Salado. On the south it is bounded by the Arroyo del Medio. On the west, a desert separates it from Cordova ; and on the north it extends towards the Laguna Salados de los Porongos, and the deserts of the Gran Chaco. The surface of the country is a plateau, from forty to sixty feet above the level of the Paranà, partly covered with the coarse grass and thistles of the pampas, and partly with low mimosa trees. It is said scarcely ever to rain in this country. Cattle and horses consti-

tute the wealth of the people. The River Tercero, or Carcaranal, which joins the Paranà at Fort St. Espiritu, is navigable. In the northern districts there is a small tribe of Guaycurus, in a state of independence.

SANTA FÉ, the capital, has about 4000 inhabitants. Rosario is a considerable place, built on the high banks of the River Paranà.

The REPUBLIC of CORDOVA lies west of Santa Fé. An uninhabited country separates it on the east from Santa Fé. On the north it is separated from the republics of Santiago del Estero and Catamarca by the Travesia de Ambargasta and the Great Salinas; on the west by the republic of St. Luis de la Punta. The soil is generally a sandy loam, and not fit for cultivation without irrigation; the rains and the streams supply water for the pastures. Herds of cattle, sheep, and goats, are reared in abundance. Maize is cultivated in the valleys, and a little wheat in several places. The fruit-trees of southern Europe succeed. The eastern portion of the republic is nearly uninhabited and chiefly covered with low mimosa trees.

CORDOVA, the capital, stands on the small River Primero, in a valley about 200 feet below the surrounding plains. It is regularly laid out, well built, and has a cathedral; and a university erected by the Jesuits; the population is about 14,000 souls. Alta Gracia, a neat town near the base of the Sierra de Cordova, contains 4000 inhabitants.

The REPUBLIC of SAN LUIS DE LA PUNTA lies west of Cordova and extends to the Rio Desaguadero. On the south it is contiguous to the country of the Ranqueles. On the north it extends over the greater part of the *travesia desert*, which borders on the Great Salinas. It is said to be a very poor country. The northern districts are almost uninhabited, and in many places covered with low mimosas; in others, without trees and vegetation, and covered with saline efflorescences or with sand. The southern districts are crossed by rocky ridges. It has a few pasture grounds for cattle and goats. There are some silver mines in the Cerro Solosta, called Las Carolinas, which are worked on a small scale. The climate is dry and hot; rain seldom occurs.

SAN LUIS DE LA PUNTA, the capital, has about 1500 inhabitants.

The REPUBLIC of MENDOZA comprehends the country west of the Desaguadero de Guanacache as far as the Andes, including the Vale of Uspallata. It extends north to south for about 32 deg. south latitude. This republic is flat, with the exception of the Paramilla eastern range of the Andes. The soil is sandy, with little grass, and occasionally covered with mimosa trees. When irrigated, the soil will yield abundant crops of wheat, Indian corn, and lucerne. Rain and dew are rare, except in the southern districts on the banks of the River Diamante, where more corn may be raised without irrigation. The climate is dry and healthy, though great heat is experienced in summer. It is very favourable to the growth of figs, peaches, apples, nuts, olives, and grapes. There are some

silver-mines notwithstanding the Paramilla Range on the side of the Vale of Uspallata. Cattle and horses are not numerous; mules are exported.

MENDOZA, the capital, is near the eastern declivity of the Paramilla Range, 4891 feet above the sea-level, and is a well-built town, with about 12,000 inhabitants. Two well-frequented roads lead from this place to Chile, over the Andes, by the mountain-passes of Uspallata and of Portillo. San Martin, or Villanueva, west of Mendoza, is a thriving place, with about 2000 inhabitants.

THE REPUBLIC OF SAN JUAN DE LA FRONTERA extends along the base of the Andes from 32 deg. to 30 deg. south latitude, and includes the northern part of the Vale of Uspallata. The soil resembles that of Mendoza. The climate is healthy, though dry. Both rain and dew are rare; the heat is not excessive. It is very favourable to fruit, and wine constitutes an article of export.

SAN JUAN, the capital, is situated on the banks of the Rio de San Juan, and is said to have a population of 8000. It has some export trade in the wines and brandies of the country, and in foreign goods for home consumption. A road from it leads to the mountain-pass of Patos, in the Andes, whence it descends into Chile by the Vale of Putaendo.

THE REPUBLIC OF RIOJA lies principally within the Andes, between 30 deg. and 28 deg. south latitude: it extends over two valleys. The Vale of Guadacol, between the Andes and the Sierra de Famatina, is fertile, and not too warm for the growth of wheat; it has also copper mines; but neither the wheat nor the copper can be brought to market on account of the expense. The inhabitants, who are mostly of Indian origin, hunt the vicuña for its skin. Some silver mines are worked on a small scale.

RIOJA, the capital, not far from the eastern base of the Sierra Velasco, has some trade in the products of the country, and between 3000 and 4000 inhabitants.

THE REPUBLIC OF CATAMARCA lies further north, extending over some valleys which run south and north, and intersect the mountain-region of the Despoblado, where it is contiguous to the principal chain of the Andes. It appears to contain several fertile valleys between the mountains, in which cattle are reared and corn raised. Cotton and red pepper are cultivated for exportation.

CATAMARCA, the capital, contains about 4000 inhabitants.

THE REPUBLIC OF SANTIAGO DEL ESTERO lies to the east of the Great Salinas, between 27 deg. and 30 deg. south latitude, and 62 deg. and 65 deg. west longitude. It comprehends two narrow and long cultivable tracts, along both banks of the rivers Dulce and Salado, and vary from one to five miles in width. On the cultivable tracts wheat and Indian corn yield good crops. Cochineal to some extent is collected, as well as honey and wax. The climate is

considered to be the hottest in South America. Ponchos, blankets, and coarse saddle-cloths are made and sent to the neighbouring countries.

SANTIAGO DEL ESTERO, the capital, on the banks of the Rio Dulce, contains about 4000 inhabitants. Matara is on the Rio Salado, and from that place downwards the river is navigable for large river-boats.

The REPUBLIC of TUCUMAN, north of Santiago del Estero, lies between 26 deg. and 27 deg. 30 min. south latitude, and 62 deg. and 66 deg. west longitude. The western districts, which are contiguous to the Sierra Aconquija, are chiefly covered with high mountains, among which there are a few narrow valleys. The mountains are covered with high forest trees, and contain good pasture. There are also some mines of gold, silver, copper, and lead. The central part of the republic extends over the most fertile and best cultivated part of the plain of Tucuman. It is considered the Garden of the Provinces of La Plata. It yields wheat, maize, rice, tobacco, and sugar. The cattle are of large size. Horses and mules are exported. The climate is dry and hot, but healthy. The eastern districts on both sides of the Rio Salado are rather sterile, and there are only a few settlements on the banks of the river. A great number of Indians within this republic speak the Quichua language.

TUCUMAN, the capital, situated on a plateau, contains about 8000 inhabitants. It has some trade, and exports horses and mules to Bolivia.

The REPUBLIC of SALTA is the most northern of the Argentine republics, and extends over the Despoblado range of the Andes, and the plains which lie between the rivers Salado and Vermejo, south of the mountains. Its boundaries are not well defined, and its area is supposed to equal that of Paraguay. The few Indians collect some gold, and hunt the vicuñas, alpacas, and chinchilla, for their skins and wool, and bring down ice and salt to the valleys. Near the southern slope of the mountains are the silver mines of San Antonio de los Cobres and of Acay. The elevated valleys produce wheat and maize; the declivities are generally wooded or pasture lands. The valleys along the rivers Salado and Lavayen, produce rice, maize, and tropical fruits, sugar, indigo, cotton, and tobacco. On the banks of the Vermejo cochineal is collected, and the còcoplant is raised; the tree from which the yerba-maté, or Paraguay tea, is obtained, is indigenous. The climate is as various as the productions. On the Despoblado the weather all the year round resembles winter in England; the low country on the Rio Vermejo suffers from excessive heat. The valleys have a more or less temperate climate, according to their elevation.

SALTA, the capital, is situated in a valley, exposed to inundations; it contains from 8000 to 9000 inhabitants; its commerce is inconsiderable. Jujuy, with about 4000 inhabitants, on the banks of the river of the same name, is a trading place, though the mountain-pass begins here which runs northward to Tupiza, Potosi,

and Chuquisaca, and over the Abra de Cortaderas, about 12,000 feet above the level of the sea.

The population of all the Argentine states, or provinces, is vaguely estimated as follows, viz.:—Buenos Ayres, about 210,000; Uruguay, 115,000; Entre Rios, 34,000; Corrientes, 38,000; Misiones, 9000; Paraguay, 400,000; Santa Fé, 17,000; Cordova, 86,000; San Luis, 24,000; Mendoza, 40,000; San Juan, 24,000; Rioja, 19,000; Catamarca, 34,000; Santiago, 48,000; Tucuman, 44,000; Salta, 55,000.

In the southern provinces the inhabitants consist chiefly of the Spanish race. In Paraguay the Misiones and Corrientes, the Guaraní Indians, who were civilised by the Jesuits, constitute the great majority of the people. Indian families are settled in Entre Rios, Santa Fé, and Cordova. In the republics north of 28 deg. south latitude, there are Indians who speak the Quichua, or Peruvian, language. A great portion of the region is still the undisputed property of native tribes. Numerous tribes inhabit the Gran Chacó, between the Paraguay and Paraná, and the Rio Solado. The Guaycuru tribe is said to be the most numerous. The Ranqueles, and unknown tribes, inhabit the country south of 35 deg. south, west from Buenos Ayres to the Cordilleras. The pampas Indians are a nomade people, who move over the pastures with their cattle.

The GUACHOS, of Spanish race, are also scattered over the pampas. They are said not to be numerous, and live in huts. They are early trained to ride, and hunt with the lasso. They live on animal food, the produce of their herds and hunting. Their drink is water, are strong, and can endure great fatigue. They are described as hospitable to strangers.

Manufactures.—A few woollen stuffs are made at Santiago del Estero, and sent to the neighbouring countries. British manufactures have hitherto been chiefly used.

Trade.—The internal commerce is considerable, as almost every republic produces something peculiar, which is in demand in the neighbouring countries. It is also facilitated by the level character of the country, and its climate, which is generally dry; the roads, also, are tolerably good. The navigation on the Paraguay River extends north to Brazil, on the Paraná up to the Apipé, on the Uruguay up to the Salto Chico, to which places vessels of 300 tons burden may ascend. By this inland navigation the products of the northern republics are brought to Buenos Ayres or Monte Video, whence they are exported. But the commerce with the neighbouring republics and to Brazil is unimportant; horses and mules were formerly exported in large numbers to Bolivia and Peru; this trade is said to have nearly ceased. The ports of Monte Video and Buenos Ayres engross nearly all the maritime trade.

Government.—The existing government of Buenos Ayres, under Rosas, is a military despotism. Most of the inland provinces, and especially the Guacho inhabitants of the pastoral regions, are, in a great degree, independent.

CHAPTER XXIX.

THE REPUBLIC OF PARAGUAY.

THE whole of Paraguay and the republic of Monte Video have scarcely at any time, since the revolt and independence of the Argentine Provinces, joined in the federal association of republican states, nominally included in the Argentine Confederation.

Paraguay comprehends the extensive region between the rivers Paraná and Paraguay, and extends from between 21 deg. and 27 deg. 30 min. south latitude, and 54 deg. to nearly 58 deg. west longitude. Estimated area vaguely stated at from 70,000 to 90,000 square miles.

It was discovered by Sebastian Cabot, or Gaboto, in 1526 ; Alcedo describes it thus ;—

“ It is of a warm and moist temperature, from the number of woods, lakes, and rivers with which it is covered, and from the various overflowings which are formed between the months of November and April, when the rains are most abundant. It is watered by an infinite number of rivers, the principal of which are, first that of its own name, and then those in the northern parts of Porrudos, Mboteley, Tobati, Ipane Piray, and others of less note ; and in the south part, those of Cañabé and Tibiquari, this dividing this province from that of the Río de la Plata of Buenos Ayres.

“ The woods are many, and in them grow in abundance sour oranges, citrons, limes, and other wild fruits, of which conserves are made. There are also trees of very good timber, and fine wood, such as cedars, *petoroques*, *urundais*, *tajibos*, and others ; of the first they make canoes and slabs, which they carry to Buenos Ayres for vessels and for other uses. In these woods are found a variety of birds and animals, such as rabbits, hares, partridges, wild-boar, deer, and other species of creatures less known, such as *quiriquinchos*, *mulitas*, and *aperiades* ; but from the great quantity of neat cattle, the flesh of which is preferred to any other here, none of the above animals are ever hunted ; sometimes, however, the inhabitants will hunt geese, which abound in the lakes and the shores of the river, and kill great numbers. Here also breed goldfinches, nightingales, larks, green parrots, long-tailed parrots, others of most beautiful plumage, and peacocks ; nor are there wanting ostriches, and birds of prey.”

The Jesuits laboured so assiduously and successfully to convert the Indians, that the greater part of the country came under the power of the former ; they extended their dominion over Paraguay, and organised the Indians into a disciplined body of militia, and prevented all persons, both Spaniards and Portuguese, from entering their territories.

From Paraguay and Paraná they drew great revenues ; their converts worked for them cheerfully, at stated periods, on their plantations ; and the Jesuits not only imported every thing necessary for their people from Europe, but they also sent

immense sums to the superiors of their order at Rome. The Indians were carefully kept in ignorance of the Spanish language; they were instructed in all sorts of useful arts, and trained to the fatigues of military life. They were formed into large bodies of cavalry and infantry, and well supplied with arms and ammunition: as cavalry, the aboriginals were distinguished equestrians.

Many hundred thousands of the native races came under the authority of, and became infatuated subjects to, the Jesuit fathers. But in 1750 the courts of Madrid and Lisbon entered into a treaty for the purpose of definitively fixing the boundaries of their respective possessions in the western world.

Commissions were appointed in 1752, to carry this treaty into execution. The representations of the Jesuits, who secretly thwarted the extension of the Portuguese limits, caused a war between Spain and Portugal, in which the Indians took an active part against the Portuguese. The court of Lisbon, in consequence, or rather the Marquis of Pombal, began to entertain suspicions of the real motive of the Jesuits in forming such extensive establishments in America.

Soon after, a trial was instituted against one of the order in France by some of the merchants concerned in speculations at Martinique, which had involved the society in debt. On this trial the *institute* of their order, and their registers were examined, and found to contain principles and doctrines subversive of monarchy, and of the interests of the kingdom. It was consequently decreed to suppress the order of Jesuits in France. On the year following, the King of Portugal was assassinated, and it was resolved to expel the Jesuits from that kingdom.

This was followed by their expulsion from Spain and Naples, in 1767, and in 1773 Pope Clement (Gangarelli) XIV. totally abolished the society.

They were banished from America soon after, and the *cure* of the native tribes they had converted, was transferred to priests of other orders, but chiefly to the Franciscans, and the government was placed in the hands of civil officers.

On their expulsion from the territories on the banks of the Paraná, there were discovered, in thirty settlements alone, no less than 769,590 horses, 13,900 mules, and 271,540 sheep.

The *presidios*, or garrisons of this province, when under Spanish rule, were nineteen in number, without counting the capital, in which was a body of 350 guardsmen, as well of infantry as of horse.

Besides these, there were boats which plied on the rivers to impede the passes to the infidels, or to surprise and cut off their retreats.

"The aforesaid garrisons were not only a check to the Indians, but they excluded from the navigation of the river any foreign vessel, independently that it required great skill in any navigator inexperienced with these parts not to take a wrong course, from the number of mouths and creeks which present themselves, and which have often misled."—*Alcedo*.

The greater part of the natives are described by Alcedo and other Spanish authorities as of the Guarani nation, descendants of those who were

“Converted by San Francisco Solano and his companions, with the exception of some families of the Monteses, Canguias, and other nations since reduced. Here were also four new *reduccions* made, which were under the charge of the Jesuits, called San Estónislao, San Joaquín, Nuestra Señora de Belén, and El Santo Corazón. In each of these settlements was an Indian corregidor without jurisdiction, and appointed only to regard the proceedings of the other corregidores, and to cause to be fulfilled the orders of the curate and of the administrator of the goods of the settlement. Each of them had two alcaldes, and the other officers of the *cabildo*, and these, as well as the corregidor, were elected by the influence of the curate, who knew the abilities of his Indians; but these elections were confirmed by the governor of the province; and to the curate was assigned ten per cent of the profits of his settlement. Ever since the first establishment of these settlements, there was allotted to each the territory thought necessary for sowing of seeds and the breeding of cattle, and when the harvest was gathered in, it was put into one common granary, to the end that it might be divided equally amongst all as their necessities might require, by the administrator; the same practice was observed with regard to the rations of meat. With the excess of the corn and cattle a means was procured of adorning the churches, of assisting the sick, and of promoting public works. Neither Spaniards, mulattoes, nor negroes were admitted into these settlements except as traders.

“The ecclesiastical government was well organised under the religious order of San Francisco, and amongst the first converters were enumerated Father Alonzo de Buena-ventura, and Father Juan de San Bernardo, a lay-brother who suffered martyrdom under the Caazapas Indians. At daybreak mass was said every morning, *with fine music*, and on festival days somewhat later, with a discourse regularly by the curate. This finished, the *cabildo* went to receive its orders for the day, and the same were imparted to the whole settlement, that every one might know his occupation. The matrons had their tasks assigned to them proportionate to their strength and capacity, and the unmarried and girls remained singing and reciting prayers for the morning, after the mass was finished, in the court-yard of the church, and repeated the same at nightfall. The rest of the day they were employed in assisting their mothers, whilst the men were employed in different handicraft works, as carpentering, sculpture, musical instrument making, weaving, and other mechanical arts and employments, for which they had excellent masters. Every night the *cabildo* came to the curate to inform him of what had happened in the course of the day, and the people, after saying the rosary, betook themselves to rest.

“These Indians paid no other tribute than personal service to those under whom they lived notwithstanding it had been attempted by the king to introduce a different system. In the settlement of Itape, for instance, there was no vassalage, but the Indians there assisted with their persons and rafts all those who passed in the time of the floods a large arm of the River Tibiquari, by which led the road to Villarica.

“This province has suffered, from its first formation, various convulsions and alterations, from being divided into parties, formed from vain ideas of honour or interest, and has been the scene of much bloodshed. To its bishopric, which was erected in 1547, belonged also the settlements of Paraná, situate to the south-east.”—*Alcedo*.

Along the Paraná, and along the Paraguay, north to Angostura, the country is low, marshy, and without fuel. Wooded marshes occur further north. The greater part of the interior country is hilly, and in some parts mountainous. The hills are covered with forests; the valleys and plains are nearly destitute of wood, and afford excellent pasture-ground. The climate is salubrious and temperate. Its rainy season lasts from March to June. The productions are

numerous. The Yerba-maté, or Paraguay tea, was, it is stated, exported formerly to the amount of 8,000,000 lbs. Great quantities of timber are, however, floated down to Buenos Ayres. Tobacco, sugar, and cotton have been also exported. The indigo-plant and caoutchouc-tree grow wild. Exclusive of the navigable Paraguay and Paraná rivers, the River Tibiquari, which traverses the southern districts, is navigable in the greater part of its course.

THE Population of Paraguay, according to Azara's Work, published in 1809.

The state of Paraguay is situated on the eastern bank of the River Paraguay, which, with the Bermejo, flows into the Paraná. Aided by Buenos Ayres, Paraguay was freed from Spanish domination. In a Spanish work on the Argentine republics published in 1825, the author says of Paraguay.

"It occupies an obscure place in politics, and maintains no social or mercantile relation with any part of the world, for which state of seclusion it is favoured by its detached local situation. Without knowing whether this circumstance ought to be attributed to the rustic character of the only person (Dr. Francia) who has governed Paraguay during the greater part of that time, or to the constitutional apathy and ignorance of the persons governed, the fact is, that, notwithstanding it followed the sentiment of the whole territory as regards its separation from Spain, that province has not only taken no part in the war of independence, by which it has incurred a general odium; but also, since that

moment, has cut off all communication with the contiguous and united provinces, and thus continued, till the present time, to prevent the exportation of its interesting productions, and to prohibit the return of all foreigners or natives, with very few exceptions, who came for the purpose of introducing ultra-marine merchandise into Paraguay.

“Paraguay should fill a much more important station than it did under the Spanish government; principally on account of its abundant mountain forests, growing timber of all kinds, well adapted for ship-building; which, in fact, has always been one of its principal branches of commerce. Most of the small vessels, employed in the trade of all the internal rivers, have been constructed there; and in Paraguay also some ships have been built, which have navigated the River Paraná, in ballast, as far as Buenos Ayres; that is to say, a distance of 400 leagues. In the year 1824, one of these ships sailed to Lima, after having made several voyages to Europe. The other productions, such as the Paraguay tea (*yerba-maté*, or *chenopodium ambrosioides*), which is greatly superior to that of Brazil, and of which, in that part of America, there is a greater consumption than of tea from China, in the United States—*coloured tobacco*, which, in some respects, is superior to that of the Havannah, and which will equal it in all, when a better system of gathering and growing is adopted—cotton, of which considerable exports might be made even to Europe—and, in short, many other productions, such as the earth pistachio (*mani*, or the *Arachis hypogea*), sugar, reed-cane, honey, &c. &c. &c., will all give to Paraguay, whenever it ceases to be the *Great China* of South America, the place of one of the most distinguished provinces. M. Bompland, who was the companion of Baron Humboldt in his travels, is still (in 1824) living in Paraguay. He was in the towns of Misiones, situated between Corrientes and Paraguay, pursuing the researches which he was, as a naturalist, employed to make by the government of the United Provinces of Rio de la Plata; which circumstance exciting jealousy in the ruling authority of Paraguay, it would not suffer him or his attendants to leave its territory, or even to send copies of the insects he had collected, but caused him to be forcibly conducted to the capital, where he lives at liberty, following the medical profession, but without hope of escaping from that imprisonment, except through some sudden caprice of that *stoical governor*, or the natural course of events.”

ASUNSION, the capital, situated near the banks of the Paraguay, has about 10,000 inhabitants, and a considerable trade in the produce of the country. Villa Real de Concepcion, with 4000 inhabitants, lies further north on the Paraguay, and is the place to which the produce of the forests of Yerba-Maté is brought: these forests cover the hills from sixty to eighty miles east of the capital.

The more recent accounts of Paraguay, by Robertson and others, describe the state of cultivation superior to that of the neighbouring Argentine states. White-washed cottages were, says Mr. Robertson, frequently seen among the trees; and around them were considerable fields of cotton, yucca, and tobacco. Indian corn, and sugar-cane, were frequently seen in the vicinity of the farm-houses; and there was abundance of wood and prickly pears, with the latter the cultivated country and paddocks are well provided. The dictator possessed nearly half the country; the savannah, pasture-lands and forests, the estates of the Jesuit missions, and other corporate religious bodies, and many country-houses and farming-establishments, were confiscated and seized by him in the name of the state. It is but justice to say that he sedulously improved all these properties, and rendered them productive. On some parts large cattle and horse farms

were established. He let others at moderate or nominal rents, subjected to be well cultivated. His cavalry was supplied by the pasture farms. Monthly reports of the farms were invariably demanded and received by him. He extended the agricultural operations far beyond annual gatherings of *maté*, or tea, the culture of some tobacco, sugar-cane, and yucca. In 1820 the plague of locusts overran and destroyed eighty leagues of circuit. To avert famine, he compelled the farmers to sow a second crop; the harvest of which was most abundant. By despotic regulations, he extended his agricultural improvements over the whole country. Rice, maize, cotton, culinary vegetables were grown; and the breeding of cattle and horses was extensively promoted. Paraguay tea is as much used in Chile, La Plata, Peru, and Brazil, as China tea in England. He also compelled them to establish manufactories. His government was absolute, though the whole was nominally republican. He allowed of no public debt. If the war between Buenos Ayres and Monte Video were ended;—if those countries were tranquillised, the period will have arrived when a very lucrative trade may be carried on with the fertile region of Paraguay and the countries drained by the Paraná and its affluents. In his day Francia may have, as a dictator, prepared this state for future prosperity.

CHAPTER XXX.

MONTE VIDEO, OR URUGUAY.

THE republic of *Uruguay*, or *Banda Oriental*, extends from the northern coast and banks of the La Plata, to the southern boundary of Brazil. It is but imperfectly explored from the Atlantic to the River Uruguay. This state extends on the west, along the Uruguay River about 300 miles, and on the Atlantic for about 200 miles. The average width, from east to west, exceeds 230 miles. Estimated area 69,000 square miles.

Uruguay has generally an undulating fertile soil, with occasional broken interruptions, and is almost destitute of forest trees. The climate is temperate; it never freezes. Rain falls abundantly during winter, but seldom in summer. Cultivation is neglected for pasturage. Cattle and horses form the wealth of the inhabitants. The articles of export are hides, skins, hair, horns, and jerked beef. Sheep breeding and rearing is almost entirely neglected.

In a Spanish work, which we have quoted, Monte Video is asserted to be favoured by nature, as if it had been selected for the display of fertility and

beauty, and not less important on account of its geographical situation, at the mouth of the River La Plata, forty leagues distant from the capital city of Buenos Ayres. Its climate, which has sensibly improved during the last forty years, is temperate and humid; but as that quality is moderated by the invariably dry land winds from the north-west—commonly called *passageros*, because they pass through the open plains of Buenos Ayres—and by its proximity to the ocean, the temperature of its atmosphere is the most healthy possible. In the year 1810, that province numbered a population of from 60,000 to 70,000 souls, including that of the city, which was not less than 20,000. In 1825, however, it scarcely contained from 40,000 to 50,000, that is, 10,000 in the city, and the remainder in the country. There are many inhabited places in it: as, Maldonado, Colonia, Santa Lucia, Camelones, San Jose, San Carlos, Soriano, and Cerro Largo, which are all towns; and the villages are Toledo, Pando, Rocha, Penarol, Piedras, San Salvador, Minas, Florida, Porongos, Colla, Bacas, Nivoras, Espinilla, Mercedes, Paisandù, and Hervidera. The decrease of population was occasioned first by the war with Spain, which in that territory was carried on as in no other part of the united provinces; by the civil war which raged there, during the revolution against Spain; and also by the domination of the Portuguese, or Brazilians, from which, being universally detested, the natives have fled in great numbers, emigrating to the other provinces. Monte Video was peopled, little more than about a century ago, by a colony sent from Buenos Ayres. At that time the country was occupied by a multitude of Indians, of whom now only remain the very few who live in the remote parts, known by the name of *Charrecas*. The new colonists found the country abounding with vicuna. Since that time the soil, fertile in all parts, even in the mountains with which it abounds, appears to have been used particularly for grazing, its cattle having continued all along to be the staple branch of the commerce of Monte Video; not only by reason of the exportation of vicuna and horse-hides, but also of salted meat and tallow. Monte Video at one time possessed thirty-three establishments for curing meat; each of them killing at least one hundred head of cattle daily, without that consumption being felt in regard to the vicuna, the multiplication of which race is assisted there by an infinite variety of natural circumstances. Nearly the whole country abounds in excellent pastures, of excellent quality, and fertilised by the irrigation of rivers, rivulets, and springs. At each step the traveller finds himself meeting with streams of pure water, the scenery presents a constant succession of hills, eminences, meadows, wilds, rugged defiles, and mountains. The principal rivers are, the *Uruguay*, *Negro*, *Ybiquì*, *Cebollati*, *Yì*, *Santa Lucia*, *Guegisay*, *Diaman*, *Arapei*, *Guarey*, *Olimar*, *Pardo*, *Tacuari*, *Yguaron*, and *Tacuarembò*. The currents of these rivers are formed by countless streams, “many of them very

considerable, which run in all directions, excepting an elevated ridge of land which crosses the whole province, and is called *Cuchilla grande*. Almost all these rivers might be made navigable through the greatest part of their course. Those that are now navigated are the Uruguay, Negro, Cebollati, and Santa Lucia."

MONTE VIDEO, situated on the north shore of the Rio de la Plata, was founded near its mouth by order of Field-marshal Don Bruno de Zavala, in 1726. "Until 1807 it was a small place, having only one parish and a convent of the order of San Francisco. It had once a house of Jesuits. It is situate on a lofty spot, upon a bay. It has a citadel or castle, which is badly constructed, with four bulwarks and some batteries for its defence—the same is the residence of the governor. The town, which is well fortified with a strong wall and sufficient artillery, is inhabited by more than 10,000 souls, amongst whom are some rich and noble families. The climate is excellent, cheerful, and healthy, the soil fertile and abounding in vegetable productions, and flesh and fish are so plentiful as to cost almost nothing. Its principal commerce consists in the hides of cattle, and these are killed merely for the above perquisites. It is 111 miles east-south-east from Buenos Ayres, in latitude 34 deg. 50 min. 30 sec. south, and longitude 56 deg. 16 min. west." Such is the description of Alcedo.

Few places in Spanish America have experienced a greater change in political consequence and physical energies, since the time Alcedo wrote, than Uruguay. Independently of its wars with Buenos Ayres, it has been rendered famous by the English expedition which visited the Rio la Plata in 1806. It was for some little time in possession of the British troops, and finally evacuated at the beginning of September, 1807.

The town of Monte Video, according to Mr. Mawe, is tolerably well built, standing on a gentle elevation at the extremity of a small peninsula, and is walled entirely round—

"Its population amounted in 1820 to between 15,000 and 18,000 souls. The harbour, although shoal, and quite open to the *pamperos*, is the best in the Rio de la Plata; it has a very soft bottom of deep mud. When the wind continues for some time at north-east, ships drawing twelve feet water are frequently aground for several days, so that the harbour cannot be called a good one for vessels above 300 or 400 tons."

There are but few capital buildings; the town in general consists of houses of one story, floored with brick, and provided with very poor conveniences. In the square is a handsome cathedral, awkwardly situated; opposite to it is an edifice divided into a town-house or *cabildo*, and a prison. The streets having no pavement, are clouded with dust or loaded with mud as the weather happens to be dry or wet. In seasons of drought the want of water is a serious inconvenience, the spring which principally supplies the town being two miles distant.

Provisions are cheap and abundant. Beef is plentiful, and, though rarely fat or fine, makes excellent soup. *The pork is not eatable.*

The inhabitants of Monte Video, particularly the Creolians, are described as humane and well-disposed, *when not actuated by political or religious prejudices*. Their habits of life are indolent and temperate. The ladies are generally affable and polite, fond of dress, and neat and cleanly in their persons; they adopt the English or French fashions at home, but go abroad usually in black, and always covered with a large veil or mantle. At mass they invariably appear in black silk, bordered with deep fringes. They delight in conversation, are vivacious, and very courteous to strangers.

The chief trade of Monte Video consists in hides, tallow, and dried or jerked beef: the two first are exported to Europe, and the latter is sent to the West Indies, especially to the Havannah. The coarse copper from Chile in square cakes, is sometimes shipped here, as well as *maté*, or tea of Paraguay, the infusion of which is as common a beverage in these parts as tea is in England.*

The climate of Monte Video is humid. The weather in the winter months (June, July, and August), is at times boisterous, and the air in that season is generally keen and piercing. In summer the serenity of the atmosphere is frequently interrupted by thunder-storms, preceded by terrific lightning, which frequently damages the shipping,—and followed by heavy rain, which sometimes destroys the harvest. The heat is oppressive, and is rendered more so to strangers by the swarms of mosquitoes, which infest every apartment.

The town stands on a basis of granite. The high mount on the opposite side of the bay is crowned with a lighthouse, and gives name to the town.

The vicinity of Monte Video, is agreeably diversified with gently sloping hills, and long valleys watered by beautiful streams; but the prospects they afford are rarely enlivened by traces of cultivation; few enclosures are seen except the gardens of the principal merchants. The same neglect appears in a north-east direction from the town, where varieties of hill, valley, and water prevail, and seem to want only the embellishment of cultivated and wooded scenery to complete

* The inhabitants were by no means opulent before the English took the garrison, but through the misfortunes of the latter at Buenos Ayres, and the losses of our commercial adventurers by ill-judged and imprudent speculations, they were considerably enriched. The great prospects indulged in England, before the expedition to the Plata, of immense profits by trade to that river, have generally ended in ruin; very few, indeed, of the speculators have escaped without considerable loss. Property, once litigated, at Buenos Ayres, might be considered in a fair way for confiscation: and in case of its having been deposited until certain questions were decided, restitution was generally obtained at the loss of one-half. Not contented with the profits accruing from his commission, the consignee seldom scrupled to take every advantage which possession of the property afforded him, of furthering his own interests at the expense of his correspondent. The dread of a legal process could be but a slight check upon him; for in the Spanish courts of justice, as well as in others, a native and a stranger are seldom upon equal terms. Other circumstances have concurred to enrich the inhabitants of Monte Video. It is a fact that the English exported thither goods to the amount of 1,500,000*l* sterling, a small portion of which, on the restoration of the place to the Spaniards, was reshipped for the Cape of Good Hope and the West Indies; the remainder was for the most part sacrificed at whatever price the Spaniards chose to give. As their own produce advanced in proportion as ours lowered in price, those among them who speculated gained considerably. The holders of English goods sold their stock at upwards of fifty per cent profit immediately after the evacuation of the place.—*Mawe*.

the landscape. Some wood, indeed, grows on the margin of the Riochuelo, which is used for building hovels and for fuel. The want of wood occasions great inconvenience and expense; wood for mechanical purposes is extremely scarce, and planks are so dear that few houses with a boarded floor are to be found.

About twenty-five leagues north-east from Monte Video, is an irregular ridge of granite mountains extending nearly north and south, and the country from this distance gradually assumes a rugged appearance. The ravines of these stony wilds, and the wooded margins of the rivers, afford shelter to ferocious animals, such as jaguars, here called tigers, small lions, and ounces; wild dogs breed in the rocks, and at times make great havoc among the young cattle. The farms in this district, for the most part, include tracts of land from twenty to thirty miles in length by half that extent in breadth, watered by clear streams. Herds of cattle are bred upon them; at one time it was calculated that each square league maintained 1500 or 2000 head, but the war and anarchy must have diminished these numbers.

At the distance of about forty leagues north-east from Monte Video, the hills gradually lessen and disappear; the country opens on the left, and is intersected by numerous rivulets.

The country in this part may in general be termed rocky and mountainous. Solid rock frequently appears on the surface, and in many places projects in masses; the mountains and rocks are of granite; fine red and yellow jasper, chalcedony, and quartz, are not unfrequently found loose on the surface. Some fossils of the asbestos kind, and some very poor oxides of iron, are likewise to be met with. The limestone on one ridge is of a close compact kind, united to transparent quartz in a tabular form, standing, as it were, in laminæ perpendicular to the horizon. The cavities formed by the laminæ afford refuge for reptiles.

The limestone is loosened by wedges and levers, and brought away in large slabs to the kilns, where it is broken into fragments of a convenient size, and burnt with wood. The lime, when slaked, is measured, put into sacks made of green hides, and sent in large carts drawn by oxen, principally to Colonia, Monte Video, and Buenos Ayres.

Barriga Negra is distant about 160 miles north-east from Monte Video, about 120 from Maldonado, and ninety from the town of Minas. The surrounding country is mountainous, well-watered, and partly wooded; the banks of the streams are covered with trees, rarely, however, of large size; for the creeping plants, interweaving with the shoots, check their growth and form an impenetrable thicket. In this district are the great breeding estates, many of which were stocked with from 60,000 to 200,000 head of cattle. These are herded principally by Peons from Paraguay, who live in hovels at convenient distances. Ten thousand head are allotted to four or five Peons, who collect them every morning and

evening; and once or twice a month drive them into pens where they are kept for a night. The cattle by this mode of management are tamed; a vicious beast is never seen among them. Breeding, alone, is attended to; neither butter nor cheese is made, and milk is scarcely known as an article of food. The constant food is beef, eaten generally without bread, and frequently without salt. This habitual subsistence on animal food would probably engender diseases, were it not corrected by regularly drinking their favourite *maté*.

The dwellings are wretched, the walls being formed by a few upright posts interwoven with branches of trees, plastered with mud inside and out, and the roof thatched with grass and rushes. The furniture of these hovels consists of a few skulls of horses, which serve for seats, and of a hide to lie upon. The principal cooking utensil is a rod or spit of iron stuck in the ground in an oblique position, so as to incline over the fire. The beef transfixed on this spit is left to roast until the part next the fire is done enough, then turned round until the whole is cooked. Fuel in some parts is so extremely scarce that a strange expedient is resorted to. The mares are kept solely for breeding, and are never trained to labour; they generally exceed the due proportion; many of them are frequently killed for their hides and tails, and their carcasses are used as fuel.

The Peons are chiefly emigrants from Paraguay, and among them very few women are to be found. A person may travel in these parts for days together without seeing or hearing of a single female in the course of his journey. To this circumstance may be attributed the total absence of domestic comfort in the dwellings of these wretched men, and the gloomy apathy observable in their dispositions and habits.

The dexterity of the Peons in catching cattle, by throwing a noose over them, has been frequently detailed. They throw with equal precision and effect, whether at full gallop or at rest. Their method of catching horses, by means of balls attached to leather thongs, is unerring.

In training mules and horses to draw light carts and other carriages, no harness is made use of; a saddle or pad is girded on, and a leather thong is fastened to the girth on one side, so that the animal moving forward with his body in a rather oblique direction, keeps his legs clear of the apparatus which is attached to him, and draws with considerable freedom. In the catching of cattle the Peon fastens one end of his *lasso* (or noosed thong) to the girth of his horse, who soon learns to place himself in such an attitude as to draw the ox which his rider has noosed.

The horses are spirited, and perform almost incredible labour. They seldom work longer than a week at a time, being then turned out to pasture for months together. Their sole food is grass, and the treatment they meet with is harsh and unmerciful. They are never shod.

Sheep are very scarce, and seldom or never eaten ; they are kept by some persons merely for the sake of their wool, to make flocks for bedding. The cattle herds bred in many parts of this district have often tempted the Portuguese to make predatory incursions, and the country being accessible by fine open passes to the frontier, as well as to the north side of the Plata, these violations of territory have been carried on to a very serious extent. So frequent were they at one period, that it became necessary to appoint a military force to patrol the boundaries against these inroads.

Agriculture.—There is abundance of excellent clay, and plenty of wood near the margin of the rivers, yet it is rare to meet with an enclosure, even for a kitchen garden, much more so for a corn-field. They generally choose the grounds for tillage by the bank of a rivulet, so as to have one side or sometimes two sides bounded by it ; the remainder is fenced in the most clumsy manner. Ploughing is performed by two oxen yoked to a crooked piece of wood about four inches in diameter, and pointed at the end. After the ground has been roughly broken up, wheat is sown, without any attempt to cleanse it from noxious seeds. While it grows up, wild oats, poppies, and other pernicious weeds grow among it in luxuriance. Indian corn, beans, melons, &c., are all treated in a similar way. The wheat is cut down with sickles and gathered into sheaves. A circular pen of from forty to sixty yards in diameter is then formed with rails and hides ; in the centre of this enclosure is placed a large quantity of wheat in the straw. The pile is so formed as to have the ears on the outside. A small quantity is pulled down towards the circumference of the circle, and a herd of about twenty mares is driven in, which, being untamed, are easily frightened and made to gallop round. At this pace they are kept by means of whips for four or five hours, until the corn is trodden out of the ears, and the straw completely broken up. Another parcel of sheaves is then pulled down, and a fresh herd of mares is let in, and this operation is repeated until the whole heap is threshed, and the straw is broken into chaff. In this state it is left until the wind happens to rise, and then it is winnowed. It is sewed up in hides, and sent to the sea-ports, where biscuit is baked.

The climate and soil are favourable for the growth of grapes, apples, peaches, and every species of fruit belonging to the temperate zone, but these are not generally cultivated. The potato would thrive abundantly, but the people remain averse to improving their means of subsistence, and seem to wish for nothing beyond the bare necessities of life. The Peons, brought from Paraguay in their infancy, grow up to the age of manhood in a state of servitude, uncheered by domestic comfort ; at that period they generally wander in search of employment toward the coast, where money is in greater plenty. They are for the most part an honest and harmless race, though as liable from their condi-

tion to acquire habits of gambling and intoxication, as the higher classes : many of whom fall victims to those vices.

The common people generally go without shoes and stockings: as they rarely go on foot they have seldom occasion for shoes. Some of them, particularly the Peons, make a kind of boot from the raw skins of young horses, which they frequently kill for this sole purpose. When the animal is dead, they cut the skin round the thigh, about eighteen inches above the gambrel; having stripped it, they stretch and dress it until it loses the hair and becomes white. The lower part, which covered the joint, forms the heel, and the extremity is tied up in a bunch to cover the toes. The rest of their apparel consists of a jacket, which is worn by all ranks, and a shirt and drawers made of a coarse cotton cloth brought from the Brazils. Children run about with no dress but their shirts until their fifth or sixth year. Their education is little attended to.

Among the many natural advantages which many parts of Uruguay possesses, are the frequent falls in the brooks and larger streams, which might be converted to various mechanical purposes, if the population were numerous and better instructed.

CHAPTER XXXI.

THE RIVERS PLATA, PARANA, PARAGUAY, URUGUAY, AND THEIR TRIBUTARIES.

WERE the regions drained by the River Plata, and its great and numerous tributaries, populously settled by an enterprising people, the inland navigation which communicates with the rich soils and products of those vast and extensive regions of the Argentine republics, would render these countries among the most prosperous and powerful in the world.

The PLATA is one of the largest known rivers in South America, after the Amazon. It was discovered by Juan Diaz de Solis in 1515; who navigated it as far as a small island in latitude 34 deg. 23 min. 30 sec. south, and who, having seen on the shores some cabins, had the boldness to disembark with ten men; when they were all put to death by the aborigines. Five years afterwards, Sebastian Cabot, who, from neglect, passed from the service of the English to that of the Spaniards, was sent to discover the Strait of Magellan. But, finding himself impeded in his views by the disobedience of his crews, was under the ne-

cessity of entering the River Plata, which he navigated as far as the island discovered by Solis, and to which he gave the name of San Gabriel. Seven leagues above this island he discovered a river which he called San Salvador, and another at thirty leagues' distance, which the natives called Sarcana; where he built a fort. He then pursued his voyage as far as the conflux of the rivers Paranà and Paraguay, and leaving the former to the west, entered by the second, and had a battle with the Indians, in which he lost twenty-five men; but succeeded in routing them, taking from them treasures of silver, which they had brought from Peru; and, supposing that there was an abundance of this metal in the territories washed by the river, called it Rio de la Plata (River of Silver); whereby it lost the name of Solis, first given it by the discoverer.*

This river receives in its extensive course the water of various other large rivers. It is subject to inundations for many leagues from its banks, fertilising the land in the same manner as the Nile. The distance from the conflux of the Paraguay and Paranà to its mouth, is about 200 leagues by the course of the river. It is interspersed with beautiful islands, and is navigable for large vessels.

The Rio Plata is at its mouth about 150 miles wide; from Cape San Antonio on the south, to Point Negro on the north. From thence to the junction of the Uruguay, it preserves its name, being afterwards called the Parana. Although the whole of it is navigable, it has many shoals and rocks. Between Point Piedras on the south, and Point Yeguas on the north, it is fifty-three miles wide. The coloured water which it brings down is often visible in the Atlantic about 100 miles from its embouchure. The estuary of the Plata is generally shallow, and the navigation extends along the southern shores, but the channel along its northern shores is sufficiently deep for ships drawing about twenty feet, as far as opposite Buenos Ayres, on its southern shore. Vessels drawing more than sixteen feet of water can seldom approach nearer the town than seven or eight miles; smaller vessels enter the inner roads to within about two miles of Buenos Ayres. The navigation of its gulf, though intricate among the extensive shoals, may hereafter be rendered easy by the aid of steam tug-boats. The tides are perceptible as far as Buenos Ayres, but between Point Las Piedras and Point Yeguas the water is generally fresh.

The PARANÀ rises in the province of Minas Geraes to the south of the city

* Another version of the origin of the name is given by the Spaniards, who say that Martim de Zousa, holding the *captainship* of St. Vicent, furnished Alexo Garcia, a Portuguese, with an escort to explore the wilds to the west of Brazil. By the route of the Tieté, he reached the Paraguay, which he crossed, and penetrated into the interior. He returned, it is said, loaded with silver, and some gold; he halted on the Paraguay, waiting for his son, with some of his people, and sent at the same time to Brazil an account of the discovery. He was surprised by a body of Indians, who killed him and took his son prisoner. The following year, sixty Portuguese, who were sent in search of Garcia, were also massacred. The Spaniards who first settled on this river, seeing so much silver amongst these Indians, and supposing it to be the produce of the country, called the river La Plata.

of San Joas del Rey, in some lofty sierras, in Brazil, and flows a course for the estimated distance of more than 1000 miles, receiving innumerable tributaries, many of them navigable from the north, west, east, and south.

At about 300 miles from its mouth two falls impede its navigation. The country through which it flows is temperate and very fertile.

Alcedo informs us that the native inhabitants of its banks,

“Were laborious, lived in settlements, sowed maize twice a year, cultivated *yucas* or *mandioca*, bred fowl, and eat human flesh, not only of their own prisoners, for they were very warlike, but even that of their own dead.”

Two monks of the order of San Francisco, who accompanied the first governor on his first voyage to this region, were the first who baptised these Indians. Friar Luis de Bolanos, companion of San Francisco Solano, erected many chapels or churches in the upper districts, establishing six *reducciones*, and uniting the Indians in settlements on the banks of the rivers Ibajiba, Paranape, and Pirapo, and, for their instruction in the catechism, he made himself master of the Guaraní tongue: many of his orations in this language having been printed by the Jesuits.

The Jesuits followed up the advantages attained by their predecessors, and founded some fresh settlements, which they called *doctrinal* establishments, in 1614. The Mamelucos Paulistas of Brazil, made various irruptions against those settlements, in order to entrap prisoners, which they might carry to sell to work in the mines and at the sugar plantations of that kingdom. They carried away nearly, it is asserted, 100,000 souls; and the missionaries were compelled to withdraw the upper settlements.

Those settlements contained in the beginning of the present century about 41,000 souls, who cultivated wheat, maize, sugar, Paraguay tea, tobacco, cotton, seeds, fruit, and vegetables.

When the Jesuits were expelled, there were in the thirty settlements of the Paraná and Paraguay, 769,589 horses, 13,905 mules, and 271,537 sheep. The *government, arts, and manufactures*, which were instituted in this territory by the Jesuits were considered by the Spaniards as a problem not to be solved: whether it should prove the perfection of a republic, or that it should be looked upon as a tyrannical despotism eager only for its own interests, and the establishment of absolute power. (*See the “Christianismo felice” of Muratori, and the collection of documents for the extermination of the Jesuits, printed by order of the Spanish government.*)

The Paraná, which the first discoverers considered as the chief, on account of its abundant waters, joins the Paraguay in latitude 27 deg. 16 min.; and their united streams take the name of the Paraná.

The Rio Paraná becomes navigable for vessels of 300 tons' burden at the island

of Apipé, about 120 miles above its junction with the Paraguay. Below this junction it is studded with low islands, covered with wild orange-trees and various trees and shrubs: the deepest channel has always from two to three fathoms of water. Before its junction with the Rio Uruguay, it separates into numerous branches, which form a delta. Most of these channels are navigable for boats; that called Parana Guazu has seldom less than two fathoms and a half of water, and that of Las Palmas is the next deepest to Guazu. This river and most of its confluent bring down from the countries within the tropics to the higher latitudes a great volume of water, which inundates the low districts along its banks from February to May. The waters rise in the end of December, and increase gradually to the end of April; they descend to their lowest point in July; along the lower part of the river the inundation rises about twelve feet above the lowest water level, and leaves a slimy deposit which enriches the soil.

The Paraguay River gives its name to the state. It was first navigated by Sebastian Cabot in 1526. It rises in about 13° south latitude.

This great river from authorities relied on by Mr. Mawe, flows

"In a southern course of 600 leagues before it enters the ocean under the appellation of the Rio de la Plata. The heads of the Paraguay are 270 miles north-east from Villa Bella, and 164 miles north from Cuiaba, and divided into many branches, forming complete rivers; which, as they run south, successively unite and form the channel of this immense river, which is immediately navigable. To the west, a short distance from the main source of the Paraguay, is that of the Sygotuba, which disembogues on its west bank, in latitude 15 deg. 50 min., after a course of sixty leagues. In the upper part of this river, and near its west branch, called the Jurubanba, was formerly a gold mine, which was worked with considerable profit; but the superior advantages derived from others subsequently explored in Matto Grosso and Cuiba, caused it to be abandoned, and its site is not now known with certainty. The little River Cabaral, also auriferous, enters the Paraguay on the west side, three leagues below the mouth of the Sygotuba. On the banks of the latter lives a nation of Indians, called Barbados, from the distinction peculiar to themselves, among all the Indian nations, of having large beards."

The confluence of the Jauru with the Paraguay was considered a point of importance, as guarding the great road between Villa Bella Cuiaba and the intermediate establishments, and in the same manner commanded the navigation of both the rivers, and defended the entrance into the interior of the latter *captainship*. The Paraguay from this place has a free navigation upwards, almost to its sources, about seventy leagues distant, with no other impediment than one large fall.

The boundary mark, which was placed at the mouth of the Jauru by the Portuguese, was, and may, if not destroyed, be still, a pyramid of beautiful marble, brought to this distant point from Lisbon. It bore inscriptions commemorative of the treaty between the courts of Spain and Portugal, by which the respective territories were defined.

The chain of mountains which extends from the sources of the Paraguay near its east bank, border the river opposite the mouth of the Jauru, and are terminated seven leagues below it by the Morro Excalvado. East of this point all is marsh; and nine leagues below it there flows into the east side of the Paraguay a deep river, called Rio Novo, discovered in 1786. The most distant sources of this river are the rivulets of Santa Anna and Bento Gomez. About latitude 17 deg. 33 min., the western banks of the Paraguay become mountainous at the north point of the Serra da Insua, which, three leagues to the south, makes a deep break to form the mouth of the Lake Gaiba. Six leagues and a half below the mouth of the Gaiba, and opposite the mountainous bank of the Paraguay, is the mouth of the St. Lourenço; twenty-six leagues above this the River Cuiaba enters its western bank: these two rivers are of great length. A tributary, the Itiquira, has been navigated to its heads, from whence the canoes were dragged over land to the Sucuriu, which falls into the Paraná. The tributaries Itiquira and Sucuriu were found to have fewer and smaller falls than the Jaquari.

The navigation to the town of Cuiaba by the river of that name, from its above-mentioned confluence, is short and easy. Three leagues above this place the Guacho-uassu enters the Cuiaba by its eastern bank, and on the same side, seven leagues further, the Guacho-mirim. From this point the river winds in a north-north-east direction, eleven leagues to the Island of Pirahim, and from thence makes a large bend to the east, receiving numerous streams, and passes the town of Cuiaba, which is situated a mile to the east of it. This town is ninety-six leagues to the east of Villa Bella, and the same distance by water from the confluence of its river with the Paraguay. It is large, and, together with its dependencies, contained, in 1807, 30,000 souls. It was then well provided with meat, fish, fruits, and all sorts of vegetables, at a cheap rate. The country is well adapted for cultivation, and has mines. They were discovered in 1718, and were estimated to produce annually, up to 1805, above twenty *arrobas* of gold of extremely fine quality.

Twenty leagues south-west of the town of Cuiaba is the settlement of St. Pedro del Rey, the largest of all the adjacent settlements, and contained, before the reign of Francia, about 2000 inhabitants. The River Cuiaba has its sources 190 miles above the town, and its banks have been cultivated along the greater part of its extent, including fourteen leagues below the town. Four leagues below the principal mouth of the River Porrudos, the Paraguay is bordered by the mountains that separate it from Gaiba on its west bank, and in this place they obtain the appellation of *Serra das Pedras de Amolar*. This is the only part said not annually to be inundated by the floods of the river.

From the Dourados, the Paraguay runs south to the Serras of Albuquerque, where it touches directly on the north point, on which is situated a village of that name. From Albuquerque the Paraguay turns to the south-west. It skirts its Serras, which terminate at the end of six leagues higher up in the Serra do Rabicho, opposite which, on the north bank of the river, is situated the lower south mouth of the Paraguay-mirim. This is an arm of the Paraguay, which, terminating here, forms an island fourteen leagues in length from north to south: it is the usual channel for canoes during inundations. From the mouth of the Paraguay-mirim the river takes a southerly direction to the mouth of the Taquuari, which was navigated annually by flotillas of canoes and other craft, from St. Paul's to Cuiaba, and even as far as the Register of Jaura.

The Embotetieu enters the River Paraguay five leagues below the mouth of the Taquari, and on the same side. It is now called Mondego, and was formerly navigated by the traders from St. Paul's, who entered by the Anhandery-uassu, the south branch of the Pardo. On the north bank of the Mondego, twenty leagues above its mouth, the Spaniards founded the city of Xerez, which the *Paulistas* destroyed. One league below the mouth of the Mondego there are two high insulated mounts, fronting each other on the Paraguay; at the extremity of the southern declivity of the mount on the western side, near the bank of the river, was stationed the garrison of New Coimbra, founded in 1775; it was the last and southernmost Portuguese establishment on the great Paraguay. Eleven leagues to the south of Coimbra, on the west side of the Paraguay, is the mouth of Bahia Negra, a large sheet of water of six leagues in extent, being five leagues long from north to south: it receives the waters of the wide-flooded plains and lands to the south and west of the mountains of Albuquerque. At this bay the Portuguese possessions on both banks of the Paraguay terminated. From thence the river continues to latitude 21 deg., where, on its western bank, is situated a hill known to the Portuguese by the name of Miguel José, which was crowned with a Spanish fort with four pieces of artillery, called *Bourbon*. Three leagues above this the little River Guirino falls into the Paraguay on the eastern side. Nine leagues to the south of the above fort, and in latitude 21 deg. 22 min., are other mountains on both sides the Paraguay, which command this river. Here terminate those extensive inundations to which both banks of the Paraguay are subject; they commence at the mouth of the Jauru, and to this point cover an area of 100 leagues from north to south, and forty in breadth at their highest floods, forming an apparent lake, which geographers of former days, as well as some moderns, have termed the Xarayes. During this inundation, the high mountains and elevated land which it encloses appear like superb islands, and the lower grounds form a labyrinth of lakes, bays, and ponds, many of which remain after the floods have subsided. From this place the banks

downward are in general high and firm, particularly the eastern or Portuguese side. In latitude 22 deg. 5 min., the Galban, a considerable river from the west, empties itself into it.

Between the Paraguay and the Paraná there runs from north to south the Amanbay chain of mountains; they terminate to the south of the River Iguatimy. From these mountains rise all the rivers which, from the Taquari south, flow into the Paraguay, and from the same chain also proceed many other rivers, which, taking a contrary direction, flow into the Paraná; one of them, and the most south, being the Iguatimy, which has its mouth in latitude 23 deg. 47 min., a little above the Seven Falls, or great cataract of the Paraná. This cataract is sublime. It appears from below as six rainbows. The Iguatimy has its sources ten leagues above this place, among high and rugged mountains. The River Xexuy enters the Paraguay on the east side in latitude 24 deg. 11 min., twenty leagues below the Ipane, another small river, called the Ipane-mirim, intervening.

A river of such vast magnitude as the Paraguay, in a temperate and salubrious climate, abounding with fish, bordered by extensive plains and high mountains, intersected by so many rivers, bays, lakes, and forests, must naturally have drawn many of the Indian nations to inhabit its banks; but soon after the settlement of the new continent, the incursions of the Paulistas and Spaniards dispersed and destroyed numerous tribes; the Jesuits removed many thousands to their settlements. Other tribes fled to countries less favoured, but more secure by being farther distant, and more difficult of approach. The emigration of one nation to districts occupied by others, created inveterate and sanguinary wars among them, which soon reduced their numbers. The tribes, or rather remnants of tribes, still settle or wander on the borders of the Upper Paraguay.

From the River Xexuy, downwards, the Paraguay takes its general course south for thirty-two leagues to the city of Asuncion, the capital of Paraguay.

Six leagues below Asuncion, on the west side of the Paraguay, the River Pilcomayo enters that river by its first mouth; its second is fourteen or sixteen leagues lower. In this space some other smaller rivers enter on the east side, and amongst them the Tibiquari, on an arm of which, twenty leagues south-east from Asuncion, is Villa Rica, a town owning much property in cattle on its extensive plains. The River Vermejo, or Bermejo, enters on the west side of the Paraguay, in latitude 26 deg. 45 min. Another great river, the Salado, flows in from the north-west, and joins the Paraguay or Paraná at Espiritu Santo, in latitude 32 deg. 30 min.

The Rio Uruguay rises in the Serra Cubatao, hardly more than twenty miles from the sea, and runs for a considerable distance, first west and then south-west. After its junction with the Ibicuy and Rio Mirinai, which brings down the waters

of the Laguna de Ybera, it turns southwards, and in that direction reaches the Rio de la Plata after a course of about 800 miles. The navigation is interrupted by numerous falls, which are only passable when the waters are at their greatest height during the periodical floods, or by portages in the dry season. Two considerable cataracts occur below 31 deg. south latitude, only a few miles from each other; they are called Salto Grande and Salto Chico. The Salto Grande consists of a rocky reef, running like a wall across the bed of the river; during the floods it is passable in boats, but at low water it may be crossed on horseback. The largest of the affluents of the Rio Uruguay is the Rio Negro, which joins it from the east, and runs upwards of 250 miles. It is navigable for a considerable distance, and traffic is carried on by it with the country near Lake Mirim.

From Cape Santa Maria, on the Atlantic, to the Island of Apipe, on the Paranà, the distance, about 1250 miles, is navigable, without any other reef than the English Bank (*Banco Ingles*), which would cease to be dangerous if the navigation were attended to. In the whole course of the Paranà it is asserted that there is not a rock: its bottom is clay and fine sand; some banks and shallows are here and there met with, but a channel is left at all times for the passage of vessels; and near the banks there is a greater depth than in the middle of the channel. The Paraguay is also asserted to be equally adapted for navigation.

The Pilcomayo and Bermejo, or Vermejo, which flow into the Paranà, both rise in Peru; the first near the city of Potosi, and the second in the vicinity of Tarija. They run at first with considerable impetuosity from the heights whence they descend; but through the flat country, they flow in a tranquil and majestic course. They have numerous windings, on account of the want of fall in the ground of the Gran Chaco through which they run, and which is the most level tract of all South America. The rivers which intersect this vast region are large; they tend to fertilise it, inasmuch as the flatness of the lands facilitates the inundations during the risings of the rivers down to the Paraguay, into which they disembogue themselves, after watering the lower territory.

The Spaniards of the sixteenth century founded a city on the right bank of the Pilcomayo, and called it La Asuncion, to facilitate, by means of the navigation of the river, the transport of the productions and manufactures of that country. That city, as well as another, which they founded on the Paraguay, was destroyed by the Indians, and entirely abandoned by the Spaniards.

It is evident that all productions might be transported down to the Plata from Peru by means of the navigation of Pilcomayo and Bermejo.

The River Salado, which rises in the province of Salta, and unites itself to the Paranà, is another mighty navigable stream. The Gualeguay and the Negro are two more rivers, of the third class, navigable for many leagues.

The La Plata, Paranà, Paraguay, and their affluents, therefore, enjoy all the advantages possessed by the principal rivers of America for inland navigation and trade, and especially for steamboat navigation.

BOOK VII.

STATISTICS OF THE SPANISH REPUBLICS OF SOUTH AMERICA.

CHAPTER I.

THE SPANISH COLONIAL SYSTEM.

WE have given, as far as can be ascertained, the statistics of Mexico and Central America. We have now to present, in as clear a form as our materials will allow, statistical tables and accounts relative to the trade, navigation, products, and finances of the South American Spanish Republics.

It has been already remarked that the spirit of the Spanish commercial system has descended to the republics. The same jealousy of foreigners and of foreign products is, also, still remarkable. In order to elucidate the commercial and fiscal system of the Spanish American Republics and their progress, we must sketch briefly that by which they were oppressed under Spain, and compare with it the systems, by which they, as separate governments, oppress themselves.

Spain, with absurd regulations, which embarrassed and ruined her colonial commerce, was unable to export, or manufacture the raw produce of her vast colonies,—and would neither permit them to be exported, or manufactured, by the colonists,—nor suffer foreigners to export them, and give in exchange to the colonists those articles that they most wanted. A contraband trade necessarily arose; and this illicit trade reduced the price of the products of those colonies to a wretched rate,—as their sale depended on the uncertain arrival of a greater or lesser number of smuggling vessels: which again, were exposed to the caprices, and interests, of those officers of the government, whose connivance they were obliged to purchase. Spanish colonial agriculture and commerce consequently languished; yet some colossal fortunes were acquired in two or three years by generals, intendants, and commissioners of customs.

Spain, it is true, did not impose any land-tax on her colonies; but, instead, the tithes were shared by the king with the clergy. The Indians alone paid a capitation tax. The revenues of the crown were composed of the local duties, collected on sales in the custom-houses, and on the transfer of lands, &c. There

were also municipal customs, to defray the expenses of the towns, and courts of justice, or *consolados*. The *puertos mayores*, or chief seaport towns, paid both kinds of duties; in the *puertos menores* the municipal duties only were paid. The duties which had been collected in a principal port were returned when the merchandise, on which it was levied, was despatched to a minor port; and *vice versâ*, when an exportation was made from a minor port to a superior one, it was necessary, previously, to pay the duty which should be levied at such principal port, had the merchandise been sent there direct.

After the abolition of exclusive commercial companies, and the odious privileges of Seville and Cadiz, even distinguishing the Spanish American ports into *major* and *minor* ports, was considered a relief, accorded by the cedula of 1778, commonly called the "Free Trade (?) Cedula." The spirit of this regulation was "to establish a balance between the most frequented ports, and those which were least so, in order to induce the exporters of the mother country to send consignments to the latter."

The major ports in the captain-generalship of Caraccas, were La Guayra, Porto Cabello, and Maracaybo: Cumana, Barcelona, the Island of Margarita, and the Orinoco were the minor points. Port of Spain, in Trinidad, was a free port for a limited time; that is, all nations were permitted to trade there: this privilege, granted to that colony in 1733, had, in 1797, created a great increase of population and prosperity, which it could not otherwise have attained in a whole century.

The edict of the 28th of February, 1784, established distinctions between the duties which the various commodities should pay on importation from Spain into the colonies; first, free goods, or productions of the soil and manufactures of Spain; the quota of duties on importation we have enumerated, amounted to ten per cent, and only affected the merchandise proceeding from the soil and manufactures of Spain; such goods were termed free articles. There was, secondly, another tariff for the produce of foreign countries manufactured in Spain, these were called contributable articles, and which paid twelve and a half per cent. Thirdly, goods purely foreign paid only seven per cent on importation at American ports; but as they had paid fifteen per cent on entering Spain, and seven on departure for America, without reckoning the duties we have enumerated, and those of *internacion*, *indulto*, &c., these duties amounted to more than forty-three per cent on foreign merchandise.

Taxation.—The *bulls*, whose annual sale was one of the branches of the revenue of the crown and of the clergy, stand first.

Then come the *taxes* of *alcavala*, *almozarifazgo*, *armada* and *armadilla*, of *internacion*, *indulto*, *corso*, *aprovechamientos*; the licences of *pulperias* or taverns, on the *taxa* and the *guarapo*, duties of *aduanas*, *laguna*, composition for lands, on letting lands, of lances, of the half annatas; in some provinces, a part of the

tithes, in others, *the whole tithe*; the *ecclesiastical mesadas*, and *royal ninths*, the tax levied on the *sale or change of public employments*, and that *on the profits on annual income of those places or employments*; the *tribute or capitation tax* on the *Indians*; *stamped paper*, the *right of passage*, the *fifths of mines*, the *hospitalities*, the *salt-works*, *confiscations*, *restitutions*, *vacant successions*, *vacant majorities and minorities*, the *exclusive sale of tobacco*, *cock-fightings*, *passage-boats on the river Apure*; this last tax was peculiar to the government of Caraccas.

Then follow the municipal duties of *consulado* and *avaría*, of *cabildo*, and official executor.

Dollars.

1st. Alcala de la Mar. This duty was in the captain-generalship of Venezuela, four per cent* on all kinds of merchandise, indiscriminately, which entered the ports. It was paid on entry, and not on the departure of merchandise. At Carthagena de las Indias, it was two per cent; at Guayaquil, three; at Lima, six; and at Vera Cruz, four. M. Depons says that it produced in the provinces of Venezuela, in 1793, 150,862 dollars; in 1794, 151,408 dollars; in 1795, 105,251 dollars; in 1796, 130,644 dollars; and in 1797, only 10,248 dollars; because, according to that writer, maritime commerce was in the last-named year almost entirely suspended. The true cause of the diminution of this duty was from the English having taken possession of Trinidad in the commencement of 1797, that island became the staple of almost all the trade of Venezuela; a commerce which was carried on with as little concealment as if Spain and Great Britain had been in the most strict alliance. Before the English had possessed themselves of all the commerce of the country it produced annually.	150,000
2nd. Duty of Almojarifazgo. It was levied also on all that was imported and exported; it had been fixed at fifteen per cent on all that was imported from Spain at the time of the discovery of America. But it was reduced about a century ago to three per cent on Spanish merchandise, and fixed at seven per cent on foreign merchandise, imported in Spanish ships. The Almojarifazgo, on exportation, is two per cent on home produce, and three on foreign. Its usual annual produce in the captain-generalship of Caraccas was	200,000
3rd. The duty of Armada and Armadilla, or tax for the royal navy and the flotilla. This tax was established for aiding the expenses of the navy, when it was occupied in protecting the colonies against pirates; and though those coasts have not been infested for more than a century, the duty continues to be levied; it is two per cent, and rendered annually on an average from	80,000 to 90,000
4th. The duty of Corso was instituted for paying the maintenance of <i>guardacostas</i> (revenue cruisers), for preventing contraband trade: it was three per cent, and rendered	150,000
Total of the royal duties on the imports and exports of merchandise	590,000

* The Alcala de la Mar is the offspring of the Alcala de Tierra. The Cortes had granted to the kings of Spain a tax on transfers and sales, to assist them to maintain the war against the Moors; this tax was called Alcala: those monarchs afterwards established this impost in their possessions in America towards the end of the sixteenth century. It was only two per cent at first, but it was raised to five per cent towards the middle of last century. It was levied on every thing that was sold, moveable or immovable. All the productions of the soil, as well as those of industry, eggs, pulse, forage, &c., &c., paid the Alcala on entering the towns. Shopkeepers paid this tax by subscription. This would have produced enormous sums, if in the Spanish possessions there had been more activity in commercial affairs and less contraband trade. The Alcala de Tierra produced to the revenue, on an average, in the provinces of Venezuela, 400,000 hard dollars.

	Dollars.
Brought forward	590,000
I shall not particularise the proceeds of the other royal duties and imposts paid in the interior of the country, and enumerated in another chapter, and which amounted to, including the bulls*	1,210,000
Total amount of the royal duties and imposts in the general government of Venezuela, not including the expenses of government and of collection	1,800,000

Civic Duties.

The united duties of Consulado and Average, were levied in the maritime custom-houses, and paid to the cashier of the consulado or chamber of commerce, to bear the expenses of that court ; it was one per cent on all that was exported to Spain or to the other Spanish colonies, and three per cent on all that was exported to foreign colonies, or which came from them. Beasts of burden were subject to a particular tariff. Horses and mules exported paid one dollar each ; oxen one per cent according to the valuation made of them by the custom-house officers. New negroes brought by the British contractors, were exempted from all duties : they produced about		100,000
The duty of fiel executor		70,000
That of the cabildo		80,000
Total of the civic duties		250,000

All those royal and munificent duties, which amounted, as specified, to 2,050,000 dollars, were not sufficient for paying the expenses of government in the captain-generalship of Venezuela. The intendant received annually about 1,200,000 dollars from the treasuries of Mexico and the kingdom of *New Granada*. Thus the expenses of that government amounted annually to nearly 750,000*l.*; for of all the imposts levied in that country not a farthing passed into the royal treasury of Spain. Such was the fiscal and commercial policy, of which the Spanish republics have inherited much of the spirit in their attempts at legislation.

CHAPTER II.

STATISTICS OF NEW GRANADA.

EXCEPTING as far as stated in the accounts hereafter of the exports of the precious metals, we have no details on which we can place any reliance of the former trade of New Granada and Spain. As far as manufactures were concerned, a contraband trade of great extent was carried on from the British colonies.

* The sale of bulls and indulgences amounted annually on an average in the provinces of Venezuela, to 180,000 dollars ; of which one third belonged to the crown, and the other two-thirds to the clergy.

Treaties of reciprocity have been negotiated with Colombia ; which are still binding on New Granada, Great Britain, the United States, &c. The commercial tariffs and regulations have undergone various alterations.

REVENUE.

TARIFF DUTIES.

By the last decree or law which we possess, dated Bogata, the 24th of May, the duties on importation of merchandise by foreign vessels were based on the rate of *thirty per cent ad valorem*.

The duties on merchandise imported by national vessels, or vessels belonging to countries with which there are treaties of reciprocity, at the rate of twenty-five per cent *ad valorem*.

The produce of Venezuela and Lima, are treated much the same as New Granada products.

There is, however, a long tariff of specific rates, based upon, but which may add, or diminish, the general rates of twenty-five and thirty per cent.

ARTICLES FREE OF DUTY.

The following articles, unless specially rated in the present tariff, shall be admitted free of duty: viz., gold, silver, platina in powder, bullion, and coin; machines and instruments for agricultural purposes, as, machines for cleaning, cotton-mills, sugar-mills and sawing-mills, also all kinds of machinery and implements for the use of the mines; fire and all other engines; steam vessels; all machinery, &c., for the purpose of building and repairing houses, &c., and for clearing out harbours, docks, canals, and for spinning and weaving, and also all others that may be generally applicable to arts and manufactures; beaver and nutria skins; bee-hives; surgical instruments, and all kinds of preparations, and books, plates, &c., fit for medical science; lithographic types, &c.; books, bound and unbound, pamphlets, &c.; maps, paintings, statues, busts, medals, and collections of antiquities; domestic animals; seeds and plants for agriculture and garden purposes.

No duty shall be charged on merino wool, which may be imported previous to the 1st of January, 1858, nor upon tiles, &c., stone, bricks, and lime, planks and boardings, and sawn timber, fit for building, which may be entered at the Port of Rio Hacha, previous to the 31st of May, 1846, nor upon similar building materials, imported at the Port of Chagres, entered thereat previous to the 17th of March, 1850.

Carriages, and all other articles, entered for the use of foreign diplomatic agents, consuls, vice-consuls, &c., are exempt from the payment of import duties.

The importation of all descriptions of books, prints, &c. &c., which may be contrary to religion, or offensive to morals and decency, and injurious to the public good, is most strictly prohibited. But under this head are not included works and prints, &c., proper for anatomical study or for the fine arts.

The prohibition to import anise, and essences made from it, sugar, raw, &c., honey and molasses, coffee, cocoa, and indigo, does not apply to the ports in the provinces of Panama and Veraguas, specially legalised for importation. The forenamed articles may be there imported for consumption within those provinces—transit through the ports of Panama, Chàgres, and Portobello—or for deposit at Panama or Portobello, subject always to the customary regulations affecting such transactions.

The prohibition to import cacao does not extend to the port of Tumaco; it may be there entered for consumption, within either that district or that of Barbacoas, paying an import duty of two *pesos* upon each quintal.

Should prohibited merchandise or goods be brought into any port within the republic, either in a national or foreign vessel, it shall be subjected to inspection by two competent authorities; the one named by the customs and the other by the captain or consignee of the vessel, and if the quantity of such goods shall be found to be *double* that which the above-named parties may consider as necessary for the use of the crew during the ship's passage, any quantity exceeding such requisite allowance shall be forfeited, and the captain shall be mulcted in a penalty of from 200 to 1000 *pesos*.

If the administrator of the customs shall suspect that the goods have been put down in the invoice at less than the true value in the port whence they were exported, he shall cause them to be valued at the prices which they would bear at the place whence they came, at the time of exportation; and if the value thus assessed should exceed the value in the invoice by twenty per cent, then fifty per cent shall be put upon the estimated value; and the duties shall be calculated and collected thereon: provided, however, when the estimated value as above shall not exceed the invoice value by twenty per cent, then the estimated value shall be considered the true value.

Monies.—Accounts are kept in pesos or dollars, of eight reals or twelve and a half cents; medias, or six and a fourth cents; and cuartillas or three and one-eighth cents. The dollar is also divided into halves and quarters.

Weights and Measures.—These are the same as those used in Spain.

The libra contains sixteen onza or ounces.

The quintal of 4 arrobas, 100 libras, which are equal to 101 44-100th lbs. avoirdupois.

Dry Measure.—The cahiz is equal to 12 fanegas; 1 fanega is equal to 12 celemines. The celemine is subdivided into $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, &c. The fanega measures 3439 cubic inches English, and is equal to 1.599 bushels.

Liquid Measure.—1 moyo of wine contains 16 arrobas; 1 arroba contains 8 azumbras; 1 azumbra contains 32 cuartillas.

The arroba of oil contains 3.43 English gallons; the arroba of wine contains 4.245 English gallons.

Long Measure.—The foot is divided into 12 pulgadas = 11,128 English inches.

The palmo is equal to 9 " = $8\frac{1}{2}$ "

The vara 4 palmos = 33,384 "

DECREE of the 29th of April, 1844, respecting the exportation of the produce and manufactures of New Granada and loading of ships, &c.

ARTICLE I.—All the natural and manufactured products of New Granada may be ex-

ported free, and be conducted through all the ports maritime, inland, or fluvial, whether they be licensed for importation or only for exportation, without paying any national impost: Gold and silver in trinkets, bars or dust, or in whatever other natural form they may be extracted from the mines, even though they be mixed with some other extraneous matters, are alone excepted.

ARTICLE II.—The prohibition of the exportation of the precious metals, spoken of in the former article, does not extend to the port of Panama and Veraguas, as they may be freely exported from them, whether the product of mines which are worked there or importations for circulation, for transit or deposit.

ARTICLE III.—Foreign goods and merchandise which may be imported for consumption, and upon which the fiscal dues have been payed, or properly secured, may be re-exported without paying any export duty whatever.

ARTICLE IV.—Before a vessel can commence to load, the express permission of the custom house is required, which shall be granted for the term which the chief officers thereof may think convenient.

ARTICLE V.—The permission being given, a new search visit shall be made, to ascertain if the vessel be in ballast, or if she only contain the goods, which at the time of the entry-visit the captain declared destined to other ports, or whether there be a perceptible diminution of the stores or provisions for the crew, or in the tackle, sails, and other articles of the vessel's stock.

ARTICLE VI.—The loading of every vessel shall be attended and inspected by the custom-house officers.

ARTICLE VII.—Natural or manufactured articles of the country cannot be exported, nor can foreign goods, which have been imported, be re-exported, without the knowledge and permission of the custom-house. For this purpose there shall be presented two *polices* or invoices of equal value, expressing in a detailed manner the goods intended to be exported, and the foreign port to which they are bound. These invoices must be signed by the exporter. The custom-house shall retain one, and on the other shall be put the licence as soon as the effects have been examined.

ARTICLE VIII.—A permit is also requisite from the custom-houses in order to ship stones for ballast, and pearl oyster shells from the islands of Panama and Veraguas in the Pacific Ocean.

ARTICLE IX.—Natural or manufactured goods of the country, which are to be exported, must be examined before they are shipped by the heads of the custom-house, or by the officers of the coast-guard.

ARTICLE X.—In order to examine foreign merchandise about to be re-exported, it is strictly required that the goods be conveyed to the warehouses of the custom-house, unless they are inflammable articles, or such as can be so easily inspected as not to require a minute examination, but one which may be made without the said warehouses.

ARTICLE XI.—The personal effects, which have to be embarked, as well as the stores, provisions, and other articles carried on board for consumption during the voyage, shall also be examined and inspected by the guard, in order to prevent the shipment for a foreign country of precious metals, in contravention to the prohibition.

ARTICLE XII.—Every vessel, as well national as foreign, which desires to go to load national effects or produce, at a port licensed only for exportation, must previously obtain a licence from the collector of customs of any one of the ports licensed for importation, but which cannot be granted without the consent of the first political authority of the place.

ARTICLE XIII.—Licence shall not be granted to any foreign vessel, which may have on board or be destined to receive foreign goods, whether the import duties have been paid upon them or not, but it shall be conceded to such as be in ballast or have on board national effects for exportation, and desire to proceed to the above-mentioned ports to complete their cargoes.

ARTICLE XIV.—Licence shall be granted to national vessels whether they be in ballast, carry national effects for exportation or consumption, or foreign goods to be dis-

charged in the port of exportation, provided always that the import duties thereon have been paid or duly secured.

ARTICLE XV.—Upon the arrival of a national or foreign vessel in the ports, authorised only for exportation, that have a permit to export effects of the country, the chief of the coast-guard shall visit the said vessel in the act of entering, shall see if she is in ballast or laden. In the latter case he shall require the register as also the manifests of invoices, which ought to bear the pass of the controller of the custom-house who gave the licence. If the effects are destined for the same port, which can only happen when the vessel is a national one, they shall be disembarked and examined with the formalities prescribed in regard to ports of importation. If they are destined to be exported to foreign countries, they shall be examined abroad, and compared with the registers, manifests, or invoices.

ARTICLE XVI.—The exportation of national effects and produce through the ports licensed only for exportation, shall be carried into effect with the same formalities and according to the rules established in the present law for the exportation of the same effects through the ports licensed for importation and exportation.

ARTICLE XVII.—In the maritime ports of import and export, the entrance of vessels which come with the view to complete their cargo, and have on board foreign goods, the importation of which is prohibited, shall be permitted; they must present the manifests and invoices of the said goods.

ARTICLE XVIII.—The loading of a vessel being completed, and the vessel being duly despatched by the custom house, and by the captain of the port where there exists one, it must sail immediately, and not be allowed to anchor again and remain in the port or its neighbourhood unless on account of stress of weather, or other urgent and unforeseen necessity.

ARTICLE XIX.—A report shall be drawn up of the despatch of each vessel, which shall contain, first, information of the name of the vessel and of the nation to which it belongs, the name of the captain who commands it, the number of tons measurement, and the port to which it proceeds; second, the account of the search visit; third, of the permission to load; fourth, of the registers or invoices of the embarked effects, which remain in the custom-house; and fifth, and lastly, of that in which anything may have been declared contraband, if any such there be.

ARTICLE XX.—The precious metals, the exportation of which is prohibited, which may have been embarked, may be in the act of shipment, or on which an attempt to embark or convey may be made, and all the effects and merchandise which may have been embarked, in the act of being embarked, or to embark or convey which an attempt may be made, without permission from the custom-house, or in places not appointed for that purpose, or at hours different from those specified for shipments, shall incur the penalty of forfeiture, as well as the beasts of burden, carriages, or vessels employed in the commission of or attempt at fraud.

ARTICLE XXI.—The vessel shall incur forfeiture also when her master, or mate supplying his place, receives on board any quantity of precious metals, the exportation of which is prohibited.

ARTICLE XXII.—*When, by the visits mentioned in the fifteenth article, a foreign vessel shall be found to contain merchandise of foreign production, which exceeds in amount those provisions and other articles which are considered necessary for the vessel's stock and the consumption of the crew, the vessel and all that belongs to it shall incur the penalty of confiscation.*

ARTICLE XXIII.—If, on the visit at sailing, the said necessary effects should be found to have diminished, the captain shall be liable to the following penalties: if the decrease amount to a hundred dollars, value of the effects at the current price in the town, he shall pay a fine of fifty dollars; if the increase be from one hundred up to five hundred dollars, the fine shall be two hundred dollars; and from five hundred dollars and upwards, the vessel and every thing that belongs to it shall be confiscated.

DECREE.

Of Ports qualified for Import and Export Traffic.—The ports qualified for import and export trade in the Atlantic Ocean, are declared to be those of Rio Hacha, Santa Martha, and Cartagena, in the provinces so called; as are also those of Portobello and Chagres, in the province of Panama, and that of Las Bocas del Toro in that of Veraguas. In the Pacific Ocean, that of Tumaco in the province of Pasto; those of Buenaventura and Panama in the provinces of their names; and those of Montijo and Bocachica in the province of Veraguas.

The Port of Arauca and that of the Uceta on the rivers of these names in the province of Casanare, are declared the fluvial ports qualified for import and export trade; and the inland ports qualified for the same purposes, are that of Cucuta in the province of Pamplona, and that of Tuquerres in that of Pasto.

Of Ports qualified for Export Trade only.—The Ports of Sabanilla and Zapote in the province of Cartagena, are declared ports qualified for export trade only.

Of Warehousing Ports.—The Ports of Cartagena, Santa Martha, Rio Hacha, and Portobello in the Atlantic Ocean; and that of Panama in the Pacific, are declared to be warehousing ports.

Of Ports through which a Transit Trade can be carried on.—The transit trade can be carried on through the ports of Panama, Portobello, and Chagres.

Of Free Ports.—In the Pacific Ocean, the ports of Buenaventura and Tumaco are free ports; the former until the year 1879, the latter until 1861.

Every class of national and foreign vessels, can freely enter and leave the free ports, without paying port dues, or import, or other national duties.

[The executive power can except, in case of necessity, from the general disposition of this article, vessels of nations at war with New Granada.]

The exemption from duties mentioned in the two antecedent articles, only comprises merchandise which may be consumed in the town of Buenaventura, or the Island of Tumaco; and goods, which leave the said town or island for another or other places of the republic, by land, by river, or by sea, are subject to the payment of national duties.

The following legislative dispositions remain subsisting, viz., the decree of the 11th of June, 1842, authorising the executive power to open the port of San Buenaventura on the River Zulia, and declare that of Cucuta a warehousing port; the decree of the 1st of July of the same year, authorising the executive power to open for import trade the port of Sabanilla in the province of Cartagena.

The Port of Iscuandé in the province of Buenaventura, shall remain closed until the completion of the road of the province of Popayan to the margins of the River Iscuandé, the port being only open for the salt and provision trade necessary for the consumption of the inhabitants of the cantons of Iscuandé, Micai, and Barbacoas.

Given at Bogota on the 22nd of March, 1844.

Tonnage Duties.—By the levy of the 29th of March, 1846, the duties on ships, viz., entrance, tonnage, anchorage, and pilot dues, to be collected under one head, to be denominated tonnage duty.—(See Scale hereafter.)

The Granadian ton shall consist of twenty quintals of about 103 lbs. avoirdupois.

DECREE, authorising the introduction of Foreign Effects by the Port of Chagres, with direction to the Custom-house of Panama, with a view to be imported through the latter.

I, PEDRO ALCANTARA HERRAN, President of the Republic, Decree.

I. The introduction by the Port of Chagres of foreign effects intended to be imported through the custom-house of Panama, shall continue to be permitted.

II. The manifest of foreign effects introduced by Chagres to be imported through

the custom-house of Panama, shall be presented within the term, and with formalities prescribed in the 23rd Article of the Law of the 5th of June of this year.

III. In the said manifesto, the name of the person to whom the effects are addressed in Panama, to be delivered to the custom-house, and who is to take the other steps relative to the importation, shall be stated.

IV. After the delivery of the manifest, the heads of the custom-house of Chagres shall permit the effects to be trans-shipped from the vessel in which they were brought, to those which are to convey them by the River "Gorgona" or "Cruces," or to be landed and conveyed to the warehouses of the custom-house, if the trans-shipment could not be effected, or if the party interested desire it.

V. In order to carry into effect the trans-shipment, or the landing of the packages, one of the two chiefs of the custom-house shall compare them with the manifest as respects their kind, numbers, and marks, and shall seal them with the custom-house seal, kept for that purpose, and which shall bear the inscription "Importation for Panama."

VI. It shall not be necessary to open the packages in order to compare them with the manifest, which shall only be done with the object stated in the foregoing Article.

VII. The packages shall be conveyed from Chagres to Panama, with a permit issued by the Chagres custom-house; to obtain which the party interested shall present a duplicate application to the heads thereof, for the said permit, the original being drawn out on a stamp, and the duplicate on common paper.

VIII. The application for the permit shall be the same in every respect as the original manifest, setting forth the packages, their nature, numbers, marks, and contents of each, together with the declaration that they are directed to Panama, to be imported through the custom-house of that port, and the name of the owner or consignee in that city.

IX. The heads of the Chagres custom-house shall compare the original and duplicate application for the permit with the manifest, and if found correct, shall annex the corresponding licence, together with the declaration that the effects have not paid import duties, and of the term within which they must be presented in the custom-house of Panama.

X. The licence being issued, and copy of it made upon the duplicate which is to remain in the custom-house, with the documents serving as vouchers of its accounts, the original shall be delivered to the party interested, that it may accompany the effects.

XI. Immediately after issuing the permit, the comptroller at Chagres shall remit to the comptroller of Panama the original manifest.

XII. The comptroller at Panama shall duly inform the comptroller at Chagres of the receipt of the manifest, as also of that of the permit, and of the effects which accompany it.

XIII. The bales shall on no account be opened in their passage from Chagres to Panama.

XIV. Although, in order to proceed to the examination of the packages of a manifest, the arrival of all those belonging to the same permit or manifest is to be waited for, this does not hinder the examination of such packages as may be observed to have received damage in the transit.

XV. In the receipt of the packages, examination of the effects, and calculation, payment, or security, for the import duties, the Panama custom-house shall proceed in conformity with the Law upon the subject, and the Decree published yesterday for carrying the same into effect.

XVI. Effects introduced by Chagres, with a view to be imported in Panama, cannot, after having been declared as such, be left in bond, nor re-exported without paying the import duty.

Given at Bogota, on the 4th of November, 1844.

RETURN of Tonnage Dues, including Fees, and other Charges imposed on Shipping at the Ports of New Granada.

		s. d.	OBSERVATIONS.
		per ton.	
Port Dues on national or British vessels.	{ Under 100 tons	3 0	National coasting vessels, vessels of war, packets, post-office vessels (national or foreign) pay no tonnage dues. CHAPTER III.

TRADE AND NAVIGATION OF NEW GRANADA.

THE contraband trade interferes so seriously with official statements, that they are much under the actual amount. We have received a report published in the bulletin of the Minister of Commerce of France, of which the following is a condensed translation :—

Money, 25 francs = 1*l.* sterling.

According to local information obtained by the French consuls, the average annual value of the foreign trade of New Granada is estimated at 40,000,000 francs.

Imports.—The imports in 1840 scarcely exceeded 17,000,000 francs; in 1843 they rose to 23,000,000 francs; in 1844 they fell to 22,000,000 francs.

Exports.—In 1843 the exports amounted to 16,000,000 francs; in 1844 they fell to 14,000,000 francs.

Customs' Duties.—Of the 22,000,000 francs value of merchandise entered for consumption in 1844, the customs duties' amounted to 5,770,000 francs, or more than twenty per cent on the official value.

Trading Countries.—The countries which contributed mostly to the trade of New Granada, are Jamaica and Liverpool, to the extent of 13,000,000 francs; France, 3,769,000 francs; United States, 1,000,000 francs; Island of Curaçao, 820,000 francs; Spain, 610,000 francs; Venezuela and Peru, each about 750,000 francs.

English Trade.—The English imports, forming three-fifths of the whole, were principally composed of cheap *cloths* and *stuffs* of all kinds, and which no country can compete with in price; the bad and discoloured *cottons* of Switzerland and Germany are those which seem more particularly to menace similar English articles in the Granadian market.

United States Trade.—The importation from the United States diminish yearly; they are principally made up of *flour*, *salt goods*, *drugs*, and imitations of European goods.

Spanish Trade.—Spain expedites to New Granada, either direct or indirect by the way of the Island of St. Thomas, *raisins*, *wines* of Catalonia, *Sauhucar*, and of Malaga; common *oil* and rough Biscay *iron*, which latter the English have imitated, and are in a fair way to supplant.

French Trade.—The trade of France with New Granada appears to have greatly fluctuated. During the years 1837 to 1840, the French imports amounted to an annual average of about 1,135,000 francs; during the political disturbances which agitated that country, *nil*; in 1843-44, they were estimated at 3,000,000 francs. Havre de Grace alone sent to the New Granadian market manufactured goods to the amount of 3,000,000 francs.

The French *cloths, velvets, paper, the ribands* of St. Etienne, and particularly *Parisian goods*, find an advantageous market. The fine superior French *silks* are too expensive to find buyers as yet; the same is also the case with the fine *muslins* of Mulhouse and French *indianas*.

French *wines and brandy*, upon which there is a high duty, have but a limited sale; the greater part of the population of New Granada are too poor to purchase even the cheap wines of Spain: they drink in general nothing but water.

PORT OF CARTHAGENA.—The periodical returns for the Port of Carthagena, prior to 1844, were very indifferent and incomplete; we can therefore only give a *resumé* for the last two years (1843 and 1844).

This is one of the finest harbours in the world; it will float, secured from all danger, a whole fleet, and is the only port on the coast of Granada fit for the repair of vessels.

General Navigation.—The navigation, not including the coasting trade, amounted to eighty-six vessels, measuring 12,605 tons in the year 1843, and to eighty vessels and 12,950 tons in 1844.

English Tonnage.—The amount of English tonnage trading to this port for the year 1844, was 5404 tons, the United States 3432 tons, and France 3102 tons. Other countries almost *nil*.

Trade.—The total value of the interchanges of merchandise in the year 1843, are valued at 10,369,000 francs, of which goods to the amount of 3,731,000 francs were imported, and 6,638,000 francs were exported. In the year 1844, they only amounted to 9,020,000 francs, of which the imports were estimated at 3,017,000 francs, and the exports at 6,013,000 francs. Carthagena enjoyed one-fourth part of the total commercial operations of the country in 1844.

Imports—English Trade.—This trade received from England and its dependencies to the value of 1,740,000 francs of *tissues and manufactured articles*.

French Trade.—From France 654,000 francs, composed of *painted cloths, ordinary cloths, silks, linen, &c.*

United States Trade.—And from the United States 473,000 francs, chiefly *flour* and other kinds of *provisions*.

Exports to England.—The exports from this port, principally made to England, amounted to 5,176,000 francs of *specie* (doubloons), and small quantities of *platinum, dibidivi, tobacco, Indian corn, and beasts of burden*.

To France.—The exports to France limited themselves to 335,000 francs.

United States.—And those to the United States to about the same value, composed principally of *specie, raw and cured hides*, and a few parcels of *tortoise-shell*.

Canal.—To give greater vigour to its trade, a canal is being re-opened, which formerly communicated with the interior, and joined the River Magdalen to the sea. It will commence at Barranca, about six myriametes (seventy-two miles) above the mouth of the Magdalen, and in the centre of a country producing *sugar, hides, cacao, dyewoods, &c.* The completion of this canal will have the effect, it is hoped of drawing out the produce of New Granada and of diminishing the expense of transport.

**DIRECT TRADE OF FRANCE WITH NEW GRANADA.
1837 to 1844.**

YEARS.	Navigation entered and departed.		General Trade.			Special Trade.		
			Imports.	Exports.	TOTAL.	Imports.	Exports.	TOTAL.
	Vessels.	Tons.	fr.	fr.	fr.	fr.	fr.	fr.
1837.....	15	3,222	550,000	439,000	989,000	227,000	361,000	588,000
1838.....	5	1,522	495,000	435,000	930,000	334,000	383,000	717,000
1839.....	15	2,684	526,000	167,000	693,000	416,000	92,000	508,000
1840.....	30	5,555	680,000	640,000	1,320,000	299,000	312,000	611,000
1841.....	28	5,213	1,039,000	561,000	1,600,000	557,000	295,000	852,000
1842.....	21	3,865	894,000	1,413,000	2,311,000	543,000	1,061,000	1,604,000
1843.....	23	3,916	1,532,000	2,916,000	4,448,000	782,000	1,919,000	2,701,000
1844.....	20	3,250	1,319,000	3,127,000	4,446,000	1,096,000	1,919,000	3,015,000

From the above table we see that from 1840 the French trade with New Granada has rapidly increased. The trade is almost exclusively carried on under the French flag.

Exports to France.—The exports from this country to France in 1844 were composed of *mother-of-pearl, raw hides, dyewoods, tortoise-shell, cotton wool, cigars, dibidivi, and objects of natural history, &c.*

Imports from France.—Among the French exports to New Granada the *tissues* were valued at 1,712,000 francs, of which the French manufactured 751,000 francs, the remainder being foreign; also *paper, books, and engravings* to the extent of 209,000 francs, *perfumery*, 180,000 francs; *pottery ware*, 93,000 francs; *wines and brandy*, 83,000 francs.

Tissues (woven goods) as quoted above, form a large portion of the French envoys to New Granada, the following table gives the annual value exported from France during the last eight years.

YEARS.	FRENCH WOVEN GOODS.				
	Of silk.	Of wool.	Of cotton.	Of flax and of hemp.	TOTAL.
	fr.	fr.	fr.	fr.	fr.
1837.....	85,000	10,000	6,000	52,000	153,000
1838.....	156,000	15,000	120	21,000	192,120
1839.....	65,000	"	"	1,300	66,300
1840.....	56,000	59,000	200	9,000	124,200
1841.....	31,000	5,000	53,000	2,000	91,000
1842.....	177,000	134,000	30,000	29,000	370,000
1843.....	372,000	274,000	124,000	51,000	821,000
1844.....	354,000	244,000	112,000	41,000	751,000

Mode of Trading.—To be successful in the trade of New Granada, the importers must vary their goods according to the patterns and samples sent them. To attempt to introduce a novel article of fashion would be futile; there are certain colours and patterns which in that country have become *hereditary*, and no fashion could change this national usage. Also our merchants must strictly confine themselves to the customary length and breadth in a piece of *stuff*, such is the force of habit with the natives, that they cannot be brought to understand that the larger the size and the better the quality of a *piece* of manufactured *stuff*, the greater is its price.

Payments.—There is also another very important obstacle which this trade meets with—the European *manufacturers* are too sanguine in selling their goods for ready money; when a vessel arrives, if it cannot, after disposing of its cargo, immediately procure one in return, it is forced to accept *coined gold*, which is very expensive, valuing sometimes twenty per cent. The above are facts we would strongly recommend to the serious attention of merchants trading to New Granada.

Packing Goods.—The trade of Bogota, and of the interior, complains of the *French* mode of packing their goods. On this head the English are thoroughly expert, knowing that the goods are transported on *mules*, they pack their merchandises in suitable sizes; whereas in France, the bales are made up to an impracticable bulk.

Indianas.—The size of the French *indianas* also displease the native merchants as being too large; they should imitate the English size, which is twenty-eight yards long, and never exceeds three-quarters of a yard in breadth.

Real and Paste Jewellery are greatly demanded, as also articles of *fashion*, but they must all be of a low price and in small parcels; in the latter articles, as before said, the taste and caprice of the inhabitants must be consulted.

Payments.—We cannot too strongly impress upon the attention of our merchants the absolute necessity of giving credit for merchandise sold, for six, twelve, and eighteen months together, otherwise the Granadian merchant, trading to Europe, who follows this system (it being, indeed, the custom of the country) will eventually succeed in supplanting the European trader. Houses having formed alliances with Granadian ones, a d necessity following this course, are in a prosperous condition.

Wages.—At Bogota, and in the interior, the number of European artisans are daily increasing, and good conduct and attention to their business would make them successful, but the wages being unfortunately high, lead them too often to idleness and dissipation.

PANAMA—STATE OF TRADE IN MARCH, 1845.

Trade.—The trade of this port with Europe is of very little importance. Even the English flag is seen but rarely.

Coasting Navigation.—This limited trade is carried on by means of the coasting-trade, with Callao, Guaquil, and other intermediate ports at Peru.

Products.—The products of the country are very limited, the most important, viz., *gold-dust* and *pearls*, are exported *viâ* Chagres, and in general without any official declaration, which prevents us from valuing this branch of the trade. The articles sent to Europe from Panama, are *hides* and *coffee*, generally of foreign origin, and are brought *viâ* the coasting-trade, from Central America.

Mother-of-pearl and Unmanufactured Shells.—A vessel from Bordeaux is at this moment (March, 1845) taking in a cargo of shells, in the Archipelago of the Pearl Islands, destined for Havre.

STEAM NAVIGATION BETWEEN PANAMA AND VALPARAISO—MAILS CROSSING BETWEEN THE TWO SEAS.

Navigation.—A contract has been concluded between her Britannic Majesty's government and the Pacific Steam Navigation Company, for the conveyance of mails on the western coast of South America between Valparaiso and Panama. This is an important arrangement, as the mails, being taken across the isthmus to Chagres, can be regularly brought by the vessels of the West India Royal Mail Company to this country, instead of performing the long circuitous route by Cape Horn.

The British import trade is yearly on the decrease.

	£
In 1843, the quantity of British goods imported in British bottoms amounted to	64,551
„ In New Granadian	52,189
Making a total of	116,740

In 1844, the quantity imported in British bottoms, amounted to . .	33,585
„ In New Granadian	35,847
Making a total of	69,432

In 1845, the amount in British bottoms, is only	25,321
„ In New Granadian	19,236
Making a total of	44,557

This decline is the result of the facilities afforded by the rival port of Santa Martha, for communication with the interior of the republic, and the more lenient system pursued at the custom-house of that port. The goods imported into Carthagena are almost exclusively for the consumption of the province, and few find their way into the interior.

The export trade is reduced almost entirely to *specie and bullion*, which is conveyed by the steamers of the Royal Mail Steam Packet Company, and deposited in the Bank of England, to cover the credits opened in that country.

Produce is exported chiefly from Savanilla (a port of export only, situated sixty miles to windward of Carthagena), and a small port close to Carthagena, called *Zapote*, the former of which may be called the tributary port of export for Carthagena in the present interrupted state of communication with the interior by the closing of the *Dique*. Vessels proceed hence to Savanilla to take in their homeward cargo, after unloading at this port. On the opening of the *Dique* (canal), Carthagena will again resume its place among the ports of export.

The total value of exports for this year from the Port of Carthagena is 13,488*l.*, of which only 637*l.* was exported in British bottoms. In proportion as the exports of Carthagena have decreased, so have those of Savanilla increased.

	£
Thus in 1844, the amount exported from Savanilla was	43,189
In 1845	52,638

Showing an increase in favour of 1845, of 9449l., or seventeen per cent.

The chief articles of export from Savanilla are sugar, coffee, cotton, hides, corn, tobacco, and dividivi. The amount of sugar exported is far greater this year than the preceding. In 1844, there was only exported to the value of 1158l. In 1845, there has been exported 225,408 lbs. at six dollars currency per 100 lbs. (twenty-four shillings sterling) amounting in value to 2504l., or an increase on last year of fifty-three per cent.

Cotton has decreased in value and quantity exported, the growers not taking sufficient pains to cleanse it sufficiently to compete with other markets. It has fallen in price from twenty-four to sixteen shillings the 100 lbs.

Dividivi is much reduced in importance as an article of export.

Maize, or Indian Corn has been exported to the value of 4054l., showing an increase over the preceding year of fifty-seven per cent. Its price varies from four to six shillings the fanega (two bushels and a half). It consists of two qualities, the white and red, the latter of which takes precedence. Maize forms the chief article of food of the population of the coast. It is pounded, moistened, undergoes a short culinary process, and is sold in the form of a cake under the name of bollo.

Bills on England are scarcely attainable, and the credits are met by the shipment of specie, and more especially *gold dust* (though prohibited), a large quantity of which continues to be exported, and may be bought on the coast at 250 to 262 dollars the lb. (50l. to 53l.) The surveillance of the custom-house has been unusually rigid in consequence of stringent orders from government, but nevertheless the produce of the gold mines of Antioquia, Choco, and Popayan, finds its way on board the steamers to the Bank of England.

The new gold mine discovered and opened in the year 1844, by a company of French and natives, at the head of the River Sinu, has proved a complete failure. The gold, though abundant, and of good quality, afforded only a dazzling prospect to needy adventurers, and the failure of the enterprise adds one more to the bubbles of these companies.

Tobacco, the great staple product of this country, is opening a vast source of revenue, and if properly managed, may become an important article of export. It still continues a government monopoly, and its cultivation is confined to the provinces of Ambalema and Jiron. A fear is entertained that a more liberal spirit in its cultivation may tend to deteriorate its value in foreign markets, thus an important product affording scope to agriculture and manufacture, a product peculiarly adapted to the varied soil of the country, and indolent character of its inhabitants, is hampered, and restricted from an ill-founded fear that the revenue will suffer.

At *Guaduas*, in the neighbourhood of the capital, a house has been established for the manufacture of cigars for exportation, and 4,000,000 of cigars have lately been contracted for.

Tobacco, Rum, Sugar, Coffee, and Aniseed, still continue prohibited articles of import. These, however, by a late regulation, may be bonded for re-exportation on notice to that effect being given within twenty-four hours.

The Tariff still remains as last year, though its revision has been strongly urged on government. The custom-house has, however, relaxed in its severity, and merchants are now permitted to rectify their manifests, and correct errors before presenting them to the collector, by which the odious imposition of double duties is avoided.

Vessels, of whatever nation, are exempt in this port from tonnage and anchorage duties until the year 1852—a boon granted to Carthagená for its sufferings in the siege of 1842. The only fees levied, are captain of ports and pilotage, even from these, packets and men-of-war are exonerated.

Exchange may be quoted from 530 dollars to 540 dollars currency, the 100l. sterling and doubloons command a premium of eleven to twelve per cent.

An Embryo Bank, called Caja de Ahorros, or Savings' Bank, has been established, and has yielded a nett per centage of two per month, or thirty-four per cent per annum, which may be considered as the value of money on good security.

The Dique or Canal, connecting the Bay of Carthagena with the Magdalena, is in full progress. Already one league of excavation has been effected. The dredging machine is to be shortly put in motion at the exit in the bay, which, meeting the excavating process at the town of Mahates, will complete the undertaking. The whole extent of this canal is about eighty miles from the Magdalena River near Barranca to Pasa-Caballos, in the Bay of Carthagena; of this only fifteen miles requires excavation, the rest is a natural channel. The depth is about four feet. Labourers are found in abundance at the rate of three rials, or eighteen-pence per diem, finding their own provisions.

A *Steam Company* to navigate the Magdalena has been formed in London. The new Granadian minister is elected honorary president, but this much to be desired undertaking will probably expire at its birth, as capitalists will be loth to risk their money in a country, the stability of whose institutions is still doubtful.

The Royal Mail Steam Packet Company continues its operations on this coast with increasing success, and admirable regularity. Merchants have, however, not as yet profited by the steamers for the transport of merchandise, the freight being considered too high.

The College numbers 200 pupils. The chairs of divinity, jurisprudence, and medicine, are filled, and the students qualified to take their degrees in these learned professions. A yearly public examination takes place for this purpose. The rudiments of the English and French languages are also taught.

There are two other preparatory seminaries, each of which numbers fifty scholars, who are taught in the different branches of education; and a school for the education of the better class of females is conducted in a spirit of progressive enlightenment. On the whole it may be said, that attention is being turned by the government to a more liberal system of education, the germs of which are already firmly planted.

Sufficient attention, however, is not paid to the moral and religious culture, the latter of which resolves itself in the observance principally of the outward forms of the Catholic religion, attendance on processions, &c. Throughout the republic, the priesthood are in a very depraved state, and with the exception of the higher dignitaries of the church, the common forms of morality and decorum are hardly observed.

There are Two Hospitals; the hospital of the Convent of San Juan de Dios for the poor, and the Military Hospital, conducted on a more liberal footing, access to which may be had by diseased sailors of foreign nations, on application being made to the commandant-general of the town.

The Salubrity of this port is greatly increased of latter years, owing to the greater attention to cleanliness, and perhaps a more favourable change in the seasons. Malignant fevers are rare, and though the heat is intense, the mortality among foreigners is not great. The thermometer ranges from 80 deg. to 86 deg. of Fahrenheit in the shade. The seasons are divided into two: the Verano, or dry season, and the Hibierno, or wet season; during the former, strong breezes from the north-east prevail.

The Population of Carthagena amounts to about 10,000; it is difficult to give an accurate estimate, as no census is taken. It is supposed that of this number not 1000 are white. A rapid amalgamation of colour is taking place, and ere long there will scarcely be a family on the coast of pure unmixed blood, so completely are the African and Indian races predominating over the purer Caucasian descendants of the Spanish race.

Santa Martha affords great advantages and facilities (from its locality) in the forwarding of merchandize to the interior, there being no land carriage, exposure, or transshipment, as they are at once shipped on board large-decked boats, and not again removed in any way until their arrival at Honda, the extremity of navigation on the River Magdalena; they have not these advantages in Carthagena, as the merchandise is shipped in small uncovered boats, having to go through a small canal where large boats cannot pass, and then landed and carried on mules' backs half a day's journey, to a town called

Barraula, on the Magdalena, where they are again reshipped in boats that go to Honda. In this operation there is great exposure and risk, besides considerable extra charges, which is not incurred at Santa Martha, where the merchandise is at once placed on board a boat that takes it directly to its destination, as there is a direct communication with the River Magdalena.

The principal part of the cargoes of the American, Dutch, and Granadian vessels also comprises a considerable proportion of British manufactures. A bonding warehouse has been established; merchandise can lay there for an unlimited time on paying at a rate of four per cent per annum.

There is a municipal duty on flour and some other articles, which vary in every town.

The most considerable exports are from Savanilla, a port situated at the entrance of the Magdalena, about forty miles to leeward of Santa Martha, and where there is no town, the only building being a temporary custom-house; the nearest town is Barranguilla, situated at about twenty-five miles distance. It is not a port of entry, and vessels are only allowed to proceed there to load with produce, by first calling at either the ports of Carthagena, Santa Martha, or Rio de la Hocha, entering at the custom-house, and having no goods, wares, or merchandise on board, but the necessary stores, &c., for the voyage. They then obtain clearance in ballast, with a permit to go there and load a cargo; from the facilities, and as this is the nearest port, and to windward, vessels prefer calling here for their clearance.

A considerable part of the produce shipped from Savanilla is for account of the merchants of Santa Martha, which obviates the charges of transporting it from the River Magdalena to this port.

The export of specie is considerably more than will appear by the returns. No duty being paid, as was formerly, it is difficult to ascertain correctly any average sum, as there is a very large quantity of gold-dust and bars clandestinely shipped. Uncoined gold and silver is altogether prohibited from being exported or found in the possession of any person within fifty leagues of the sea-coast, under the severest penalties.

The province of Santa Martha comprises six cantons, forty-five towns, besides several small Indian villages. The population, when the last census was taken four years ago, was 46,587 souls, and has increased very much since.

The principal and staple exports of the country affords the following; say, dye-woods of several descriptions, dry and salted hides, cotton, cedar, mahogany, dividivi, horned cattle, mules, horses, and asses, together with sugar, Indian corn, cocoa, &c. &c. The Indian corn is much cultivated, and is very productive; considerable quantities are exported to the British and other West India Islands.

The cultivation of the sugar-cane, coffee, and cocoa, has been much followed up lately; and considerable quantities of sugar are made, together with rum and other spirits, augmenting daily, and new estates establishing; the cultivation of which must benefit and advance the country rapidly, the lands being a virgin and productive soil, and this part of the country being so well watered throughout, that they are much less dependent on the seasons than in the islands; there are rivers and streams running in every direction.

The roads, within eight or ten leagues of the town, are tolerably good; and they have also the advantage of water-carriage further inland.

Agricultural affairs have been much retarded from the unsettled state of the country, the scantiness of population, and the numbers that were lately employed in the army, but, as the military are nearly all disbanded, they are now turning their attention to agricultural pursuits.

Fish.—There is abundance of river and sea-fish of the best description, and of excellent quality for salting. There are several natural salt ponds along the coast, and within a short distance from the town, where any quantity can be collected at a trifling expense.

There are several extensive lime and brick kilns within a short distance of the town, they make use of the coral rock for burning into lime.

The town is in a state of progressive improvement, and new buildings are erecting rapidly.

Slavery is abolishing fast ; in the year 1819 a law of congress was passed, declaring the issue of all slaves born after that period to be free on their attaining the age of eighteen years, it being considered that their services up to that period would initiate them into habits of industry, and be of some compensation to their owners for the expense and trouble of bring them up.

The principal part of the labourers here are the *Sanebós*, a mixed race between the Indian and negro. They are an athletic and hardy race, superior to the original Indian and negro stock. The average value of labour is from 1s. 6d. to 2s. sterling per diem, out of which they maintain themselves. Meats, provisions, dried fish, &c. &c., being uncommonly cheap, and from the nature of the climate, not requiring, and using very little clothing.

A steam-engine has lately been introduced, of about twenty-horse power, by Don Joaquim Leehelm, one of the most wealthy and intelligent men in the country. He has placed it on his estate of about one league from the town, and it has given so much satisfaction that several have been lately ordered from America.

Santa Martha, from its locality and other advantages, together with the extensive trade in corn, provisions, horses, cattle, &c. &c., with which it supplies Jamaica, and the other West India Islands, ranks it as one of the principal ports of "New Granada."

CENTRAL AMERICA.—The following consular statement for the years 1843 to 1844, though referring to the Isthmus of Nicaragua and to Salvador, we sub-join in the absence of further information.

The foreign import trade of the state of Nicaragua, and of the republics in general of Central America, has been greatly effected by the *continuance* of the internal *com-motions*; nevertheless, owing to the great competition of speculators, the consumption of foreign manufactures has increased.

The quantity of indigo exported has been about 4500 bales, three-fourths of which were the produce of the state of San Salvador, the crops of Nicaragua having almost entirely failed, owing to the want of rain during the season.

The civil war of Guatemala has partially interrupted the cultivation of cochineal, to which attention has been given in the state of Nicaragua and Salvador.

Agriculture is making some progress in Costa Rica. Coffee, which is of a superior quality, is becoming an article of export trade. 5000 quintals were shipped last year. The quantity of chancala (coarse sugar) exported from the ports of the Republic in 1838, is estimated at about 35,000 quintals, of which Costa Rica produced about two-thirds.

Mines.—Some activity is also visible in the mining districts of Costa Rica, and some valuable machinery has arrived from England.

Nicaragua is beginning to encourage the working of mines, which are supposed to abound in the mountainous districts. Gold, silver, and copper abound in all parts of the state of Honduras, but the insecurity of the country prevents persons from embarking capital in these works

CHAPTER V.

STATISTICS OF VENEZUELA.

Mines.—We have no account on which any reliance can be placed with reference to the minerals of Venezuela. The precious metals are reported to be abundant, especially in Cundinamarca. In Choco and Antiaqueo gold and silver are found, and, it is said, quicksilver. Mines of lead, iron, and copper have been worked in Socono. General Mac Gregor had cannon cast of the copper in 1813, but the backward state of enterprise has, with trifling exceptions, left the mineral riches of Venezuela undisturbed. Pasturage and agriculture, being, for a very thinly-settled region, far more immediate means of subsistence: especially since the Spanish race can no longer enslave the aborigines to work the mines.

Manufactures.—Comparatively speaking, manufactures scarcely more than exist. Tanned leather and morocco leather are prepared in Corora, blankets are made in Tocuyo, on a small scale, and constitute the chief manufactures. Some other articles are made by foreign workmen established in the country. The vapour *refined sugars*, the *cured hides*, and the *soaps*, might obtain preference

to the same articles from the United States—*tallow candles* are made of fair quality.

Some articles peculiar to the country are worthy of attention—such as *mats* made by the Indians of the *fibres* of the palm-tree, called *Mauritia*, and *hemp* of the *cocuisa aloe*, of a peculiar fineness, and *straw hats* of Maracaybo, equal in quality, or nearly so, to those of Panama. The interior provinces of Barquisimeto, of Merida, and Trujillo, manufacture *table-cloths of cotton*, but will not bear comparison with similar European articles.

The mechanical trades are workers in *jewellery*, *locksmiths' work*, *armourers work*, *joinery*, and *saddlery*, of little importance. They are manufactured with rough, coarse tools.

Joinery and *saddlery* are the most advanced trades at Caraccas, through the means of foreigners, who, for twenty years, have been settled at that place. Few samples of furniture show the great varieties of wood valuable for cabinet-makers' work.

Agriculture.—We can only give a mere sketch of the state of agriculture in this state. It is in a greater degree a pastoral than an agricultural country. Yet this extensive region has soils and climates adapted for the growth of every useful and rich product. Among the articles cultivated are some wheat in the high parts; maize, or Indian corn for tortillas (the corn bread), sugar, cacao, coffee; some cotton, indigo, and tobacco.

During the four years 1799 to 1803, 145,000 fanegas of cacao were exported from Maracaybo and Venezuela.

Sugar has long been cultivated and exported, but not in great quantities. It has been exported to England since the duty has been diminished. (*See Trade of Venezuela.*) And the province of Caraccas, if labour were abundant and enterprise exerted, has a soil and climate to produce an immense quantity.

Coffee.—Excellent coffee might be raised with ordinary care. At present its quality is inferior to that of Jamaica. The produce, in 1812, was estimated at 5,000,000 lbs. There are two kinds, the one called *of hot earth*, the other *of cold earth*; they are worth the ordinary qualities, ten gourdes and a half per 100 lbs.* Spanish (ninety-one francs per 100 kilogrammes).

Under the Spanish domination, the exportation of coffee did not surpass 60,000 quintals (2,760,000 kilogrammes) per year. From the 1st of July, 1840, to the 30th of June, 1841, the exports were estimated by the custom-house at 259,992 quintals (11,960,000 kilogrammes) of a value of 2,446,962 gourdes, or 9,788,000 francs. If to this quantity is added the 35,000 quintals, which is annually consumed at Venezuela, the actual production would be of 294,992 quintals (13,570,000 kilogrammes).

The soil and climate being one of the most favourable for the culture of this bean, it is estimated, that when once the new plantations shall be in full bearing, the country will produce above 500,000 quintals of coffee (23,000,000 kilogrammes).

Cacao.—There are numerous plantations of this indigenous fruit, chiefly in the valleys beyond the mountains of the sea-coast. In 1789, 103,655 fanegas were exported. The produce of Caraccas, Maracaybo, Cumana, and New Barcelona, in 1806, was estimated at 193,000 fanegas. That of Caraccas is considered superior, not only to the cocoa of

* The pound is 0.46 kilogrammes.

other parts of the republic, but to every other country. The *red* varies in price from sixteen to twenty-four gourdes per 110 lbs. of Spain (136 to 226 francs per 100 kilogrammes). *Gray* cocoa (which was that sent to France before the promulgation of the late Spanish *laws* on the customs of the *vascondagas* provinces) is worth at Caraccas from twelve to eighteen gourdes per 110 lbs. Spanish (113 to 170 francs per 100 kilogrammes).

There was exported from the 1st of July, 1840, to the 30th of June, 1841, 76,560 quintals (3,521,700 kilogrammes) of cocoa, of a value of 1,327,000 gourdes (5,308,000 francs).

The local consumption is calculated to be about 36,000 quintals (1,650,000 kilogrammes), and the contraband trade conceals nearly 15,000 quintals, (690,000 kilogrammes), which makes the product amount to 128,000 quintals (5,818,000 kilogrammes).

The culture of this article was of greater importance in the time of the Spaniards, as the exportation amounted then to 95,000 quintals (4,370,000 kilogrammes), but a great number of cocoa-trees were destroyed during the war of the Independence. Later, and up to 1835, the planters either had not the means, or dared not, in the uncertain state in which they lived, form new plantations. The valley of Tuy lately cultivated, which is only eight or nine leagues from Caraccas, produces excellent cocoa.

Indigo.—There are three kinds, but all are inferior to the indigo of India. That of the valley of Tuy is the most esteemed. The culture and trade of indigo at Venezuela has lost much of their importance since its separation from Spain. Before 1820, the exportation amounted annually to 10,000 quintals (460,000 kilogrammes), of a value of 1,200,000 piastres specie (6,500,000 francs); from July 1, 1840, to June 30, 1841, it amounted but to 5462 quintals (251,200 kilogrammes), which at 125 gourdes per quintal, has produced a sum of 682,750 gourdes, or 2,731,000 francs.

Cotton is not in quality so good as that of the United States. It is worth on an average thirteen gourdes per 100 lbs. Spanish (113 francs per 100 kilogrammes). Venezuela has not the long silky-like cotton.

The exportation of cotton from July 1, 1840, to June 30, 1841, amounted to 2,014,000 lbs. (926,440 kilogrammes), of a value of 242,000 gourdes (968,000 francs).

According to official documents published at Caraccas in 1839, about 50,000 quintals of cotton (2,300,000 kilogrammes), were produced, which at ten gourdes and a half per quintal, produces a value of 525,000 gourdes (2,362,000 francs); the exportation amounted the same year to 27,993 quintals (926,300 kilogrammes), valued by the minister of the finances, at 241,989 gourdes (968,000 francs). Under the Spanish government, the exportation of cotton never amounted to 25,000 quintals (1,150,000 kilogrammes).

Leather (sole leather).—That of Caraccas is considered too heavy; that of Puerto Cabello and of Angostura is exported to France. The exportation of leather, from July 1, 1840 to June 30, 1841, amounted to 574,000 lbs. (264,000 kilogrammes), valued at 506,000 gourdes 2,024,000 francs).

Dividivi.—Is a kind of husk that covers certain seeds.

To be used it must be reduced to powder, sifted, and boiled in water for the space of eight or ten hours. It is sold wholesale from six to eight reals per quintal (6fr. 50c. to 8fr. 70c. per 100 kilogrammes).

The exportation of dividivi amounted to 1,264,000 lbs. (581,440 kilogrammes), valuing 18,000 gourdes (72,000 francs).

Sarsaparilla.—13,000 lbs. (5980 kilogrammes), have been exported, of a value of 2500 gourdes (10,000 francs).

Dyeing-woods and Lignum-vitæ.—Are very little esteemed in France, and serve in general for ship ballast.

Tobacco.—There is a great variety of tobaccos in Venezuela: that of Varinas and of Cumanacao, if well selected, is excellent for cigars.

The Varinas tobacco costs but twelve gourdes or twenty-five cents, to thirteen gourdes at Angostura on the Orinoco. Until now there has been produced in the whole repub-

lic, but 50,000 or 60,000 quintals of tobacco per year (2,300,000 to 2,700,000 kilogrammes), amounting to a value of about 500,000 gourdes (40,000*l.*).

In 1841, 11,943 quintals of tobacco were exported (550,000 kilogrammes), value 146,944 gourdes (23,200*l.*). In the time of the Spaniards, the monopoly, *el estanco*, of tobacco, produced as much as 60,000*l.* annually.

Sugar.—Venezuela has seldom produced sugar, except for home consumption; in 1841, there were exported but 8794 quintals (404,500 kilogrammes). The soil is well adapted for the culture of the sugar-cane; that which is wanting are labourers: there are only 49,000 *slaves* in the whole state. In 1844 the total quantity of sugar exported was about 220 tons, in 1835 about 376 tons. Since the alteration of the sugar duties in 1845 there were exported to England from Venezuela during the six months ending the 20th of June, 702 tons, price 18*l.* 1*s.* 6*d.* per ton.

Cattle forms the principal wealth of Venezuela. The Llanos, or vast plains of the Orinoco, are covered with herds. There are reckoned to be about 2,400,000 horned cattle, 1,900,000 sheep and goats, and 400,000 pigs. During ten years the number has nearly doubled, notwithstanding the great interior consumption and mortality which has laid waste the principal *hatos* of Venezuela.

The Venezuelan *mules* are indefatigable, especially those of Angostura. One or two schooners from Martinique import them.

Indigo was first cultivated, or rather prepared in 1774, and next to tobacco, it becomes the most important product of the valley of Cumanacao, of San Fernando, and of Arenas in 1784 there were exported from La Guyara 126,233 lbs; in 1796, no less than 737,996 lbs.; while that of Guatemala at the same time was estimated at 1,200,000 lbs.

Vanilla grows in abundance in the forests. Wild cochineal grows near Coro, Carona, Truxillo, and it is produced of excellent quality in Cundinamarca. Brazil wood is exported from Maracaybo.

Cocoa trees are grown around the villages and houses, and at Cumana they have haciendas, or farms of cocoa-trees; excellent oil is extracted from the nut; sarsaparilla, Jesuits' bark, numerous medicinal plants, drugs and resins are abundant; tamarinds, oranges, and all tropical fruits thrive.

The forest trees are of the most varied and useful kinds.

Ship-building Timber.—If cut in national forests, exportation prohibited.

M. Depons says in his time, there were more than 1,200,000 oxen, 180,000 horses, and 90,000 mules pastured on the plains between the Orinoco and Maracaybo; 174,000 ox-hides are said to have been exported in 1790. Herds of cattle are now spread over the pastoral districts.

Along the banks of the Orinoco agriculture is nearly altogether neglected, and the inhabitants are described as remarkably indolent by Robinson and others.

The cattle are killed in the same manner as in Spain. The animal is led to a stake, and the point of a strong sharp knife is stuck in between the two first curvical vertebræ, and the beast drops down instantly dead.*

The agricultural and other products of the country which enter into commerce as articles of export, are stated in the statistical tables of trade.

* Robinson says, "Sometimes they bleed the animal, and sometimes not; but all of them agree in one method of cutting up the meat. No sooner has it ceased to breathe, than they commence the skinning process; and no sooner have they skinned part of it than that part is sliced off in the coarsest manner. Thus it is slashed, cut, and torn asunder in every possible form; the unsalted part being used as pieces for roasting, stewing, and boiling; while the greater part that remains is rolled in salt and hung for a few days in the heat of the sun. Then when dry they call it Tasso; and this, with the hides, form a great part of their merchandise either among themselves or with the West India Islands."

He says, "The people here drink very freely. Their breakfast in general consists of beef and (if they have it) wine or rum, and sometimes a cup of chocolate or coffee. Having performed several surgical operations in Soledad, a village near Angostura, I may here give a sort of notion how they live in that village. The breakfast is a large basin of beef, boiled with plantains: a large basin of stewed beef and onions or garlic; generally a large basin of tripe, stewed with onions or garlic; and, lastly, a piece of beef roasted over the fire on a wooden spit.

"It must be observed that this last is not brought to table on a plate, but sticking hard and fast

CHAPTER VI.

TRADE AND NAVIGATION.

NEARLY all the trade of the state of Venezuela was formerly carried on from the ports of Caraccas, chiefly through La Guayra, into each of the ports of Maracaybo, Cumana, and Old Guayra, two or three vessels were admitted from Spain. M. Lavaysse, who seems to have investigated the state of trade of Venezuela during the first years of the present century, says—

“According to official statements, Venezuela, during the year 1807, the value of the agricultural produce exported from the provinces which composed this fine country, exclusive of Trinidad, from 1794 until 1806, amounted to about 4,000,000 dollars annually; but, according to the documents taken from the custom-houses of Port of Spain in Trinidad, and from those of the islands of Grenada, Tobago, Curaçoa, St. Thomas', and Martinico, which carried on the contraband trade with the provinces of Venezuela. I am sure the smugglers carried off annually, on an average, more than 2,500,000 dollars in produce; consisting of cocoa, cotton, indigo, a little cochineal, arnotto, woods for dyeing and cabinet-makers, copper, hides, maize, salted and smoked meat and fish, oxen, horses, mules, asses, monkeys, parrots, &c., and about 600,000 or 700,000 dollars in specie, and

to the spit on which it was roasted. A person steps round from person to person, till all are served by cutting off what they wish. The bread is generally made of Indian corn, and sometimes rice. Besides Indian corn, there is another kind of bread, which they call cassava. It very much resembles in appearance the oatmeal cakes used in Scotland; but is almost tasteless. The natives use it plentifully, and seem to prefer both it and the Indian corn to our flour. The drink is, not tea, but rum-grog, and very often wine (claret). Punch is served up at eleven o'clock, which continues to be used till dinner-time. Dinner is the same as breakfast; and the evening is passed in playing cards, smoking cigars, and drinking.

“So far as I have penetrated South America I have uniformly observed, that the inhabitants seem to have no idea of grinding or bruising their materials by means of any other machinery than that which they possess in the strength of their arms, aided by a concave and convex stone to fit it, or by a wooden mortar. On the surface of the concave stone they put their material to be bruised, such as pepper, salt, coffee, &c. and it is almost incredible to what a fineness they speedily reduce these substances; while their Indian corn, rice, and such substances are bruised in the wooden mortar. After the corn has been bruised, and sometimes the rice, they subject them to the friction of the two stones, with a little water, and thus they form the one or the other into a dough for making bread.

“The better orders of the people conduct themselves at table with great regularity and propriety, as much so, indeed, as could be expected in any country where the advantages of European civilisation have not been experienced.

“The middle orders of people, however, seldom have even one knife at table, and three-fourths of them have nothing but their fingers as substitutes for spoons, knives, and forks. The lower orders, indeed, would apply them to no other purpose than as weapons of destruction to stab each other.

“From this coarse mode of feeding among the great body of the people, and from the gross materials upon which they subsist, stomachic complaints are very prevalent, which are greatly increased by habits naturally indolent and unclean.

“Smoking tobacco, especially in the form of cigars, is almost universally practised: and almost all the women, who practise this more than the men, lose their front teeth.

“Gaming, especially on Sunday, is carried on here to a great extent. This consists in billiards and in cards; and, while the outcry of every one is poverty, poverty, were you to walk into any of the huts, for instance of Soledad, you would find the tables loaded with silver and gold.

“The women dress their long, lank, black hair in two tresses, one on each side of the head. Among the higher classes, they seem to dress it in one twist, which they fasten with a comb to the upper and posterior part of their head, somewhat in the English fashion.”

since 1801, a small quantity of sugar* and coffee. There were annually exported from these provinces to Spain and Mexico,† about 2,000,000 dollars in colonial produce; which increases the exportations to about 5,200,000 dollars.

"The official statements of the intendency of Caracas specified the importations into this country, including contraband trade, at only 5,500,000 dollars, at the same period; but those statements are below the truth. On an average from 1789 to 1807, the annual importations amounted to nearly 6,500,000 dollars, including smuggling. Previous to the French revolution, the French had half of this trade. The French merchants of Martinico, the Dutch of St. Eustacia and Curaçoa, the Danish of St. Thomas, and the Swedish of St. Bartholomew, had their share in this commerce; but since the Island of Trinidad was taken by the British, in 1797, they have obtained all the trade of that country, where they have established commercial connexions, even as far as the central point of South America, in Santa Fé de Bogota, capital of the kingdom of New Granada, whose bishop, a dealer in human flesh, carried on, in 1788 and 1789, the negro trade, in conjunction with an English house in Dominica."

Humboldt, in 1803, estimated the exports of Venezuela at nearly 6,000,000 of Spanish dollars, equal to 1,333,333*l.* English money. The exports of La Guayra amounted according to his statement, to 2,400,000 dollars; those of Cumana and Nueva Barcelona, to 1,200,000 dollars; of Maracaybo and Angostura to 1,000,000 dollars; and those of Carupano and some smaller ports to 800,000 dollars. During the war of independence agriculture was much neglected, and the amount of exports decreased. In 1824, a year after that event had taken place, the exports of La Guayra did not exceed 1,650,000 dollars, though some of the articles sold at a higher price. The disturbed state of the country has prevented the trade from improving, as is apparent from the British imports, which, though by far the most important, did not exceed 200,000*l.* annually, between 1829 and 1837, on the average of that period.

STATEMENT of the Value in currency dollars of Imports into, and Exports from, the Republic of Venezuela, with the Amount of Duties thereon, distinguishing the Trade with each Country, in the Year ending the 30th of June, 1839.

* Ten years ago (about 1820) there was scarcely as much sugar made as sufficed the local consumption. I believe I do not exaggerate when I say that, on an average, every individual, rich or poor, consumes at least one pound of it per day. It is mixed with almost all kinds of food and drink; and is indispensable for chocolate, which is taken three or four times each day.—*Lavaysse.*

† A great quantity of Venezuela cocoa, commonly called Caracca, is exported to Vera Cruz.—*[ibid.]*

Report on the Trade of Venezuela, drawn up from Official Returns at Caraccas, and published by the Minister of Commerce and Agriculture, in his Official Bulletin, 1845.

Imports.—The total imports for 1841-42, were estimated at 25,220,000 francs, and in 1843-44, they fell to 17,636,000 francs (twenty-five francs to one pound sterling).

Exports.—The exports for the same period fell from 30,412,000 to 23,867,000 francs.

Decrease of Trade.—The total value, therefore, of the trade of 1843-44, gives a diminution of 14,129,000 francs, or twenty-five per cent, in comparison to that of 1841-42, and of 6,025,000 francs, or twelve per cent on that of 1842-43.

Cause.—The cause of this decrease is attributed to the badness of the seasons during the last few years—it greatly affecting the breeding of beasts and agriculture, which are the trading resources of the country. The rapidly progressive steps taken by this trade during the first twelve years of its political existence, from 1830 to 1842, was mostly owing to the credit which a country, possessing such vast resources, easily procures, at its first outset in the commercial world.

Foreign Capital.—By means of foreign capital, borrowed at fifteen, eighteen, and even twenty per cent, agricultural proprietors, having carried on their operations to an unlimited extent, an epoch of pecuniary embarrassment had overtaken them, thus creating many failures, whilst others, not so unfortunate, were compelled to retrench their expenses and their purchases, which naturally was seriously felt by the exterior trade.

Amount of decrease per Countries.—In the following tables, showing the nature and value of the merchandises composing the trade of Venezuela, it will be more particularly remarked, that the trade of Denmark and its colonies has decreased in the whole 2,803,000 francs; that of France, 1,787,000 francs; that of Spain, 1,500,000 francs; and that of England, a little more than 1,000,000 francs. The trade with the Hanse Towns and Netherlands, has remained pretty much the same. The United States is the only country which has at all increased in its trade with Venezuela. It purchases in general inferior coffee, the better quality being consumed by Germany; of 3,000,000 of kilogrammes of the latter quality, being about one-fourth part of the total exportation of this article, Hamburg took 2,500,000 in the years 1843-44, the remainder went to Bremen; the Hanse Towns are the most advantageously placed in the trade of Venezuela. From 1831 to 1842, the French trade with this country greatly developed itself. During those eleven years, its envoys rose from the paltry sum of 120,000 francs to 3,161,000 francs! and its purchases at Venezuela, from 537,000 francs to 3,886,000 francs! No other country had increased its trade with Venezuela so rapidly and in so short a time. If this trade has fallen off from 1842 to 1844, it is not the only country which experienced at that time this kind of stagnation.

Denmark, or rather the Danish possession St. Thomas, has also experienced a similar decrease in its trade with Venezuela. In 1831 its total value amounted to 7,876,000 francs, in 1841 it was estimated at more than 9,000,000 francs, but in 1843 it did not exceed 4,297,000 francs. The Island of St. Thomas, a well-known entrepôt for the trade of Europe with the continent of America, loses much of its importance in proportion as the trade with this part of America becomes more *direct*. It is the same with the Island of Curaçao which greatly affected the exchanges of the Netherlands. Its transactions with Venezuela in 1831 valued 843,000 francs; in 1841, 3,140,000 francs; and in 1843 they suddenly fell to 2,374,000 francs; and although they were more considerable in 1844 than in 1843, nevertheless its trade with Venezuela seems gradually relaxing.

Several other countries of America have a small trade with Venezuela, which may increase in importance as their population progresses, and more particularly are distinguished under this head Mexico and New Granada. Sardinia and Belgium are also beginning to frequent its ports. If we compare the years 1842 and 1843, we find the importations of *tissues* during the latter period to have considerably decreased, whereas *specie* had greatly increased, this latter causing, no doubt, the fall in the *tissues*.

Exports.—Among the exports, *coffee, tobacco, indigo, cotton,* and *specie* have greatly decreased. Of *coffee*, the exports in 1841 amounted to 13,500,000 francs; in 1842 they fell to 10,113,000 francs; and in 1843 to 8,893,000 francs. The Venezuelan

treasury depending principally upon the customs duties, necessarily experiences a great reduction in its revenue.

Customs Dues.—In the year 1840, when this republic had attained the height of its prosperity, these duties amounted to 9,000,000 francs; in 1843 they were estimated at only 5,669,000 francs, of which 5,276,000 francs were levied on the imports, or thirty per cent of the total value imported.

Imports.—Of 17,636,000 francs of imports, the ports of *La Guayra* received 9,738,000 francs; *Puerto Cabello* 2,984,000 francs; *Maracaybo* 1,922,000 francs; *Cumana* 812,000 francs; *Angostura* 631,000 francs, &c.

Exports.—Of 23,876,000 francs of exports, the ports of *La Guayra* contributed 9,184,000 francs; *Puerto-Cabello* 6,094,000 francs; *Maracaybo* 2,606,000 francs; *Angostura* 2,416,000 francs; *Maturin* 875,000 francs, &c.

Coasting Trade.—These six ports had more than seven-eighths of the whole Venezuelan trade; the others, such as *Barcelona*, *Guiria*, *La Vela*, &c., confined themselves more particularly to the coasting trade.

Cattle Trade.—*Maturin* monopolises the cattle trade.

TRADE OF VENEZUELA WITH FRANCE IN THE YEARS 1842, 1843, AND 1844.

The value of the trade of France is as follows (the direct operations only):—

Imported into France from Venezuela . . . 3,142,099 francs.

Imported into Venezuela from France . . . 3,348,235 „

Total . . . 6,491,034. „

In 1838 this trade did not exceed 4,500,000.

In the French imports, coffee, in 1842 (special trade), 1,203,824 francs (1,416,264 kilogrammes); cotton, 493,429 francs (274,127 kilogrammes); Indigo, 518,416 francs (32,401 kilogrammes); skins, raw, 305,422 francs (169,679 kilogrammes); cocoa, 174,933 francs (194,370 kilogrammes), &c.

In the French exports, silken tissues, 730,956 francs; cotton, 187,771 francs; wines, 164,589 francs; brandy, 118,633 francs; paper, books, and engravings, 150,834 francs; pottery, glass, and crystals, 106,510 francs; perfumery and soaps, 187,000 francs; cloths, 145,000 francs; mercery and fashions, 136,000 francs; linen cloths, 95,500; gold and silver ware, jewellery, manufactured metals, and Parisian industry, 148,000 francs, &c.

Navigation.—According to official documents, the navigation, in 1843, gave employment to fifty-one vessels, measuring 8477 tons, all French except five, giving an increase, in comparison with 1842, of six vessels, and 1314 tons; in 1844 there were only twenty-eight vessels, measuring 4315 tons, of which twenty-three were French.

Indianas and cotton-stuffs have been furnished, up to the present time, by England, Germany, and Switzerland. This latter country exports only indianas of middling quality. The Americans introduce their common cotton domestic stuffs into Venezuela.

Ordinary and fine linens are, in general, imported from England and Germany.

Woollen cloth comes principally from France, and also from England, Belgium, and Germany, of the ordinary qualities.

Silks are from France, England, and Germany. England imports but small quantities, generally of Indian *foulards*, and stuff for cravats and waistcoats; Switzerland imports plain ribbons; Germany copies French designs, furnishes stuffs and velvets of silk. Yet France exports to Venezuela all kinds of stuffs of silk, either pure or manufactured. Hardware comes from England and Germany; it is a very considerable article. Glassware almost exclusively from Germany. Real and false jewellery also from Germany. Delfware is imported by England.

Glass, which on account of the bad roads in Venezuela, cannot be transported but by a very few routes, is furnished, the common quality by Germany, and the fine qualities by France and England.

Furniture is imported by the Americans. It is imported in *pieces*, as a precaution against the difficult communications and the intensity of the heat.

Eatables arrive from America, Spain, and in small quantities from France.

Wine comes from Spain, America, and France. France exports to Venezuela the red wines of the Gironde in hogsheads or butts. The Spaniards and Americans furnish the sweet wines of Malaga and the red wines of Catalonia. The French wines of Languedoc are nearly analogous to those advantageously exported by the Catalonians. The trade of liqueurs is of some importance at Venezuela, and may yet be of much greater consequence; it is also a very good article for a cargo for navigation.

Soaps come almost exclusively from America; they find a market on account of their softness and low price.

Perfumes are almost exclusively from France.

Tanned goods are introduced by the French and Americans, the former bring skins and the latter the leather. This branch of importation has greatly diminished on account of the number of tan-houses established in the country.

Arms.—The low price of the German and Belgian weapons give them the priority, except rich weapons.

BRITISH CONSULAR RETURN OF THE TRADE OF VENEZUELA IN 1844-1845.

In comparing the value of the imports of the present year with the imports during the two previous years, there has been an increase of $12\frac{1}{2}$ per cent, as respects 1843 and 1844, and a diminution of 2 6-7 per cent as respects 1840-1841, the year in which the amount of imports was greatest.

In the value of the imports from Great Britain, there has been an increase of 20 1-8 per cent as compared with the imports from thence in 1843-1844.

Their amount in 1843 and 1844, having been 203,764*l.*, and in 1844-1845, 244,773*l.*

In the general exports there has been a decrease of $6\frac{1}{4}$ per cent, as compared with the exports in 1843-1844, and of 28*l.* per cent as compared with them in 1841-1842, the year in which the amount of exports was greatest.

As respects the exports to Great Britain there has been an increase in 1844-1845, of 14 7-10 per cent, the respective amounts being, in 1843-1844, 161,283*l.*, 1844-1845, 185,080*l.*

But there is a diminution of 1 1-8 per cent as respects 1842-1843, the year in which the exports to Great Britain were the greatest.

The statements hereafter furnish the particulars of the description and value of the principal articles of import and export, and of the amount of gold and silver coin imported and exported in 1844-1845.

Eight hundred and fourteen Venezuelan vessels, with a tonnage of 26,566 tons, entered the ports of the republic; and 1490 vessels, with a tonnage of 36,778 tons departed therefrom in 1844-1845; whilst 414 British and other foreign vessels, with a tonnage of 59,650 tons, entered, and 491 vessels, with a tonnage of 67,739 tons, departed therefrom during the same period.

Of the foreign vessels that entered fifty-six were British, with a tonnage of 9355 tons, and of those that departed, 119 were British, with a tonnage of 12,866 tons.

Of the total value of imports, say 793,877*l.*; 187,706*l.* were imported in Venezuelan vessels;

and 606,170*l.* in British and other foreign vessels ; and of the total value of exports say 894,745*l.* ; 177,339*l.* were exported in Venezuelan vessels, and 717,406*l.* in British and other foreign vessels.

The rate of duties on the amount of imports chargeable with a duty was, in 1844-1845, 37½ per cent, it having been 35½ per cent in 1843-1844, and 34½ per cent in 1842-1843.

The duties on exports have been taken off since the 11th of May, 1844.

The following are the rates of duties on amount of imports paid in 1844-1845 respectively by the under-mentioned countries, including in the calculation the duties termed "subsidiary," and a duty on imports charged on the entrance of vessels at "La Guairia," on amount of imports chargeable with a duty : Great Britain, 32 2-3 per cent; France, 32 4-5 per cent; United States 53 4-5 per cent.

On amount including goods admitted duty free: Great Britain, 29 7-8 per cent; France 27 1-3 per cent; United States, 34½ per cent.

The duties on warehousing of goods amounted in 1844-1845 to 825*l.*

The annexed statement, shows the amount collected for dues and charges on shipping during 1844-45, to have been 9303*l.* 14*s.* 5*d.*

The minister of finance states in his report to congress that if the amount in 1845 of the national income, 89¾ per cent was derived from duties on customs ; such duties, therefore, bear the proportion of 71¼ per cent to the total amount (to the total amount) of national and municipal income of the year.

Notwithstanding the high rate of duties levied on imports into Venezuela, there is a very general clamour for their increase, and for the establishment of commercial restrictions and prohibitions upon the delusive assumption that such measures are the only panaceas, excepting that of raising another Anglo-Venezuelan loan, which can be adopted by congress and the country, for relieving the embarrassments of the necessitous and indebted agriculturists, and for affording, according to the Venezuelan popular theory, the indispensable protection to native industry.

This retrocession from the sounder notions of commercial and financial policy, hitherto prevalent in Venezuela, is the result of the excitement engendered by the establishment at Caracas in 1843, by two or three of the principal proprietors and directors of the so-called "National Bank," of a periodical designated as *El Promotor*, in which, with a view to personal and party objects, the most subversive principles were set afloat, and the most inflammatory language was directed against foreigners, the doctrines of commercial freedom, and especially against the laws which afford the only real legal security for commercial and money transactions in Venezuela in respect of establishments and individuals, not like the national bank, clothed with the extraordinary powers and privileges of the Venezuelan fisc.

From the appearance of this mischievous paper to the present time, the nation has been designedly kept in a state of morbid irritability against, and distrust of, foreigners; and, as a consequence, the illiberal Spanish colonial system of prohibition and restrictions has been openly upheld and advocated by the several contending parties, as the surest means of acquiring political capital.

Owing to this feverish and diseased state of the public mind, to the tardiness and want of confidence in a faithful administration of justice, and to the consequent increasing disregard and callousness of debtors concerning their character and commercial credit, the trade of the country is not generally considered, by competent judges, to be in a sound or healthy condition ; and notwithstanding the increase of British imports, the trade is, in fact, fast dwindling into a species of retail trade in the hands of petty dealers.

Two long established commercial houses lately wound up their affairs. On doing this they declared "We have held on for a long time in doubt, in the hope of some favourable change, but, alas, to end in disappointment."

Neither of these commercial houses have been replaced by the establishment of other British firms.

The president, General Soublette is fully sensible of the erroneous views taken by his countryman in respect to the question of commercial freedom, and the suicidal measures, by the adoption of which they vainly flatter themselves Venezuela will be enabled to place her trade and finances upon a sound and healthy footing.

The value of foreign merchandise imported into Venezuela in 1844-1845, in transit for New Granada, amounted to 132,216 dollars 97 cents, equal to 21,154*l.* 14*s.* 2*d.*; of which amount 118,432 dollars 71 cents, equal to 18,949*l.* 4*s.* 7*d.*, was introduced through the port of Macaybo, and 13,784 dollars 26 cents, equal to 2205*l.* 9*s.* 7*d.*, through that of Angostura.

The amount of British merchandise through the two ports was as follows: through Maracaybo 47,939 dollars 26 cents, equal to 7574*l.* 5*s.* 7*d.*; through Angostura 4928 dollars 42 cents, equal to 788*l.* 7*s.*; total, 52,267 dollars 68 cents, equal to 8362*l.* 12*s.* 7*d.*

Caracas, February 16, 1846.

Value, as per Manifest, of Goods, including Gold and Silver Coin and Bullion, Imported into Venezuela from all Countries, respectively, during the Financial Year ending the 30th of June, 1845.—Exchange Six Dollars and a Quarter to the Pound Sterling.

Note A.—At La Guaira a duty of two per cent on amount of duties on imports is further collected, as a port-charge on "entrance of vessels;" but as this is in reality a duty on imports, and is not paid by the owner of the vessel, but by the importer, it is not included in the above statement.

In addition to the ordinary and extraordinary duties on imports, included in the treasury and custom-house returns under those denominations, two other duties on imports are collected; namely, 1st, a "subsidiary duty" of two per cent on the amount of those duties on imports at La Guayra, and of four per cent at all other parts: 2ndly, two per cent on amount of said duties on imports at La Guayra, collected as a port charge on the "entrance of vessels;" the two duties being together equal to four per cent on the amount of ordinary import duties with ten per cent additional, which, although termed an extraordinary duty, is, in fact, an ordinary duty, therefore the actual rate of duties on imports chargeable with a duty was, in 1844-1845, $37\frac{1}{4}$ per cent; it having been in 1843-1844, $35\frac{1}{2}$ per cent.

TRADE OF LA GUAYRA.

LA GUAYRA, the principal sea-port town of Venezuela, is situated in the province of Caracas, on the eastern shore of a small bay, and contains about 7000 inhabitants.

Vessels cast anchor in an open roadstead, exposed to the north-east wind, at a distance of from a quarter to half a mile from the wharf, where the holding ground is secure at a depth of from eight to twenty fathoms.

Pilots are not required on the entrance of vessels into this port.

The rise and fall of the tide is scarcely perceptible.

Stone, for ballast, is procured with difficulty, at a cost of from eight dollars (1*l.* 5*s.* 7½*d.*), to twelve dollars (1*l.* 18*s.* 4½*d.*), per barge-load of five tons.

In front of the custom-house there is a covered wharf about 300 feet in length for the embarkation and debarkation of passengers and goods, and close by on the beach is a fountain of fresh and wholesome water for the supply of vessels.

Cargoes of vessels are shipped or discharged by means of lighters carrying from four to four and a half tons.

The charge for lighterage is four dollars (12s. 9½d.) per load.

The cost of discharging is generally paid by the shipper, but for which he is reimbursed by charging ten per cent on the amount of freight, under the denomination of primage, five per cent of which is in fact for lighterage. The expense of loading is usually defrayed by the exporter.

Foreign merchandise or native produce is conveyed by porters between the wharf and merchants' stores, at an average charge of one rial or 4½d. a load; or, when a package is of such a weight or bulk as to require more than one porter, 9 cents, or 3½d. is paid to each man per journey.

As there is no lazaretto at this port for passengers or goods, vessels having to perform quarantine, anchor two or three miles to leeward of the town, and to avoid being placed in quarantine, a vessel must be provided with a bill of health, duly certified by a Venezuelan consul, or consul of a friendly nation.

Numerous accidents having occurred, both to passengers and goods, upon landing and embarking at the wharf, owing to the heavy ground swell in the roadstead, the municipality of this town, entered into a contract with an American engineer, to construct a breakwater, together with a small lighthouse at the point, and a building as an office for the captain of the port, for the sum of 275,000 dollars, 44,000*l*.

This breakwater was commenced in March, 1844, and is now rapidly drawing towards completion; but owing to an accumulation of sand on the inner side, washed in by the currents, unfortunately, it has not answered the expectations of the authorities or the engineer, and fresh works will have to be constructed to render it of any material or practical benefit to trade.

Small coasting craft of from about twelve to eighteen tons' burden, are able to anchor within its influence.

No reduction in the charge for the shipment or debarkation of goods has as yet been effected.

Since May, 1839, a duty of two per cent, to be calculated on the amount of tariff duties, with ten per cent addition on imports into La Guayra, has been collected under the denomination of a port charge on entrance of vessels, over and above the port due of 7 cents, 2½d., per Venezuelan ton on entrance. This is virtually a duty on imports, being paid by the owners or consignees of merchandise.

The proceeds are applicable to local purposes, and, at present, are exclusively devoted to the cost of the construction of this breakwater.

During the Venezuelan financial year, ending the 30th of June, 1844, this duty amounted to 14,442 dollars = 2311*l*.

A lighthouse due of 6 cents, 2¼d., is recovered from national and foreign merchant vessels entering the port of La Guayra from a foreign port with or without cargo; but it is not levied on vessels arriving from another port of the republic.

With the proceeds of this fund it is intended to erect a lighthouse on the Roques; a dangerous group of rocks about seventy-eight miles to the northward of La Guayra, on which many vessels proceeding from St. Thomas and Puerto Rico, and to the United States and Europe, have been wrecked.

During the financial year, ending the 30th of June, 1844, the proceeds of this duty in La Guayra, amounted to 2140 dollars, 342*l*.

CARACAS, the capital of the republic and of the province of the same name, situated about 3000 feet above the level of the sea, is separated from the port of La Guayra by a range of mountains rising abruptly from the shore, the principal communication between which is, at present, by means of a mule road of about five Columbian leagues in length, of 6666 feet each league, and 3000 feet at the highest point above the plain upon which Caracas stands, or 6000 feet above the sea.

A carriage road between the capital and this port for some years in the course of construction, has been opened since the commencement of the present year.

It is about two leagues longer than the old or mule road; and before it can be rendered safe and convenient for the general purposes of traffic, a large outlay and some years will be required.

Owing to its present defective state, little, or no reduction has hitherto occurred with respect to the ordinary charges for carriage by mules, since it has been opened.

Articles of furniture, or packages of such a bulk or weight, as previous to its opening could only be conveyed to Caraccas on the shoulders of men at an enormous cost, are now taken up at a very much lower rate; and also bales of goods, crates of glass and earthenware, &c., instead of requiring to be broken up and repacked in smaller parcels for conveyance by mules, are now carried up entire in carts.

Of late years the charge for the conveyance of cargoes has averaged about 1 dollar 50 cents, 4s. 9½*d.* per mule-load of two quintals = to about 203lbs. English; but at the present time, a bag of coffee, weighing a quintal, or equal to half a cargo, is brought from Caraccas for 31¼ cents = 1*s.*

Besides the before-mentioned import duty of two per cent, a subsidiary duty of two per cent on imports, calculated in the same manner on goods imported into La Guayra, has been levied since July, 1839; and the proceeds of which have been exclusively applied to the construction of the carriage-road between Caraccas and La Guayra.

The proceeds of this duty during the financial year 1843-1844, amounted to 14,442 dollars = 2311*l.*

Besides these amounts, the sum of 40,000 dollars = 6400*l.* out of the national revenue has, since October, 1842, been applied to the construction of this road.

There are two daily posts between La Guayra and Caraccas, from the latter other posts are periodically despatched to different parts of the interior.

A private subscription packet sails weekly between La Guayra and Puerto Cabello.

Packets with mails for the West Indies and England sail from La Guayra on the 7th and 21st of each month; whilst the mails from the West Indies and England are usually delivered at La Guayra on the 12th and 28th of each month, or on the twenty-sixth day after the packet's departure from Southampton.

Both the National Bank of Venezuela (so called) and the Caraccas branch of the British Colonial Bank, have agents at La Guayra.

Weights and Measures.—123 lbs. (libras) Spanish = 125 lbs. avoirdupois; 98,392 ditto = 100 ditto; 25 ditto = 1 arroba; 100 ditto = 1 quintal; 110 ditto = 1 fanega; 108 yards (varas) Spanish = 100 yards English; 3 feet (pies) Spanish = 1 vara; 12 inches (pulgadas) Spanish = 1 foot.

The English gallon is used for the admeasurement of liquids. Four gallons are considered as one arroba. Five wine-bottles as one gallon.

Tonnage.—About 140 Venezuelan tons = 100 tons English; about 112½ ditto = 100 tons United States; and about 134½ ditto = 100 tons French.

The total amount of port dues on vessels entering and clearing with cargo from La Guayra may be estimated at 4s. 0½*d.* per ton, British admeasurement.

IMPORTS into La Guayra during the Years 1840 to 1844 inclusive.

Note.—The total number of crews of British vessels that arrived at La Guayra during the Quinquennium, ending the 31st of December, 1844, was 1301, and the yearly average 260.

100 tons. { British register.
United States ditto
French admeasurement. } are equal to about { 140
112½
134½ } tons, Venezuelan admeasurement.

The returns for the years 1840, 1841, 1842, and 1843, only include vessels arriving from British and foreign ports; but the return for 1844 includes all vessels that arrived at La Guayra from other ports of the republic, at which they may have discharged a part of their inward cargoes, as well as those arriving from British or foreign ports. The following statement gives the number of arrivals, with the amount of Venezuelan tonnage and number of crews respectively, from British ports only, during the year 1844: Twenty-five vessels of the burden of 5779 Venezuelan tons, and manned by 261 seamen.

The returns, No. 2, of British and foreign trade, transmitted annually from this vice-consulate to her majesty's legation at Caracas, and from which this statement has been compiled, do not contain any particulars relating to the number of arrivals of Venezuelan vessels, the amount of tonnage, or the number of their crews during the two years, ending the 31st of December, 1841, as such details have been principally included under the head of "Danish" shipping; vessels under the Venezuelan flag having been chiefly employed during that period in the trade between St. Thomas and this port.

DEPARTURES, ending the 31st of December, 1844.

Note.—The total number of crews of British vessels that departed from La Guayra during the Quinquennium ending the 31st of December, 1844, was 1206, and the yearly average was 251.

100 tons. { British register.
United States ditto.
French admeasurement. } are equal to about { $\frac{140}{112\frac{1}{2}}$ } tons, Venezuelan admeasurement.

The returns for the years 1840, 1841, 1842, and 1843, only include vessels departing to British and foreign ports; but the return for 1844 includes all vessels that departed from La Guayra to other ports of the republic, at which they may have taken in a part of their outward cargoes, as well as those proceeding to a British or foreign port. The following statement gives the number of departures of vessels, and the amount of Venezuelan tonnage to British ports, only during the year 1844: Twenty-five vessels of the burden of 5779 Venezuelan tons.

The returns, No. 2, of British and foreign trade, transmitted annually from this vice-consulate to her majesty's Legation at Caracas, and from which this statement has been compiled, do not contain any particulars relating to the number of departures of Venezuelan vessels, the amount of tonnage, or the number of their crews, during the two years, ending the 31st of December, 1841, as such details have been principally included under the head of "Danish" shipping; vessels sailing under the Venezuelan flag having been chiefly employed during that period in the trade between St. Thomas and this port.

OBSERVATIONS.—The import and export trade of Great Britain is almost exclusively confined to the port of Liverpool.

It is supposed that about a quarter of the total amount of British goods imported into La Guayra, are on account of German houses; they also import linens and baizes, but not to so large an amount as cottons.

British capital enters into these speculations.

The principal British mercantile firms of La Guayra are in the practice of charging on consignments of goods from twelve to twelve and a half per cent, for commission, guarantee on sales, warehouse, collection, &c., and returns of proceeds are made at ten months.

IMPORT Trade of La Guayra, in British and Foreign Vessels, during the Year ending the 31st of December, 1845, compared with the Imports during the Year 1844. The Exchange has been calculated at the rate of Six Dollars and a quarter to the Pound Sterling.

PORTO CABELLO.—There arrived at this port, in 1844, from various parts, thirty-two British vessels, 5455 tons, 337 men; invoice value of cargoes, 337,778*l.*: value exported by these vessels, 44,733*l.* The latter consisted chiefly of copper ore, coffee, some cotton, and cattle. There was a falling off this year in the amount of imports, 6645*l.*; and in the exports, of 12,401*l.* of copper ore, the last shipment was made in June, since which the mines, for the present, have been abandoned. The increase in the exportation of coffee, is about 600 tons. The falling off in the export of cotton is nearly 6000 quintals; the low prices in Europe, and the contributions levied on its export for Venezuelan local objects, check the cultivation. The same remark applies to indigo.

Articles exported from Porto Cabello, in 1844:—copper ore, 505 tons; coffee, 11,032 quintals; cotton, 3759 packs of 100 lbs.; fustic, 539 tons; sugar (Muscovado), 471 quintals; hides, 1919; bark, forty-four tons; lignumvitæ, ten tons; dividivi, ten tons; cedar logs, seventy-one tons.

CHAPTER VII.

CUSTOMS' REGULATIONS—TARIFF OF DUTIES—FINANCES OF VENEZUELA.

Ports of Import and Export.

ARTICLE I. The following ports are hereby declared to be open for the purposes of importation and of exportation :

Angostura in the province of Guayana; Cumana, and Carupano in the province of Cumana ; Barcelona in the province of Barcelona ; La Guayra in the province of Caracas; Puerto Cabello in the province of Carabobo; La Vela in the province of Coro ; and Maracaybo in the province of Maracaybo.

II. The undermentioned ports are hereby declared to be open, only for the importation of goods for their own consumption, and for exportation : Pampatar and Juan Greigo in the province of Margarita, and Guayra and Maturin in the province of Cumana.

III. The sub-custom-house established at the shipping station of Gaza is hereby opened for the purposes of exportations to foreign countries, and at this station may be despatched all vessels desirous of loading at places from the Port of Angostura into the said station and on either side of the Orinoco.

IV. The custom-houses which are limited to despatch goods for the consumption of the port at which they are situated, may not grant permits for the conveyance of goods to other places.

§ The custom-house of Guayra is hereby excepted from this provision ; and on the contrary, is empowered to grant permits for the conveyance of foreign goods to places not open to trade which communicate by rivers with the Gulf of Paria.

V. The executive government is hereby empowered to continue open for the purposes of exportations any of the ports which it may think proper of those that are closed by the present law.

VI. The law of the 22nd of April, 1839, respecting the ports open to trade in Venezuela is hereby repealed.

TARIFF OF CUSTOMS' DUTIES.

The modifications made in 1841, and still in force in the customs' tariff of Venezuela, were unfavourable to commerce. The basis of duty on goods not admitted free, is an *ad valorem* duty of thirty per cent: the importation of salt, cocoa, sugar, and molasses, is prohibited ; the importation of spirits, extracted from sugar-cane, unless imported in bottles, is likewise prohibited. There are many articles subject to a specific duty; besides the import duty of thirty per cent, there is also levied ten per cent, calculated upon the amount of the duties, which raises the duty, *de facto*, to thirty-three per cent.

All duties on exports from the ports of the republic cease.

CLASS I. The following articles are admitted free from duty:—

Bricks, bran, moulds for sugar mills, living animals of all kinds, ploughs, peas, rice, oats, scarfs for the use of churches, drills, casks and barrels, pumps of wood or iron for irrigation, coal, carts or waggons, wheelbarrows, surplices and other garments for priests, collections or books of music or drawings, and paper prepared for music or drawings, columns of all kinds for buildings, iron cooking stoves, jackets, staves, juniper berries, baggage of passengers, statues of all sorts, copper or iron sugar or still boilers, Dutch ovens, beans, engravings, mathematical or other scientific instruments, boats of iron or wood set up or in pieces, lentils, parts of sugar mills, printed books and maps, files, Indian corn, apples, cotton gins, machines for dredging, mining, spinning, weaving, and shelling corn, steam engines, gold and silver, pans of copper, brass, or zinc, printing paper, potatoes, carriage and cart wheels, seeds, brushes.

CLASS II.—The following articles pay rates of three per cent, *ad valorem*; gold and silver table services, and generally all stuffs, works, and ornaments made of these precious metals; diamonds, bracelets, &c., &c., of gold, set with precious stones; watch keys of gold or silver, medals and medallions, jewellery, fine, whether set or plain, and rings of gold.

CLASS III.—Articles which pay rates of six per cent, *ad valorem*; viz., barometers and thermometers (four per cent), silk blonde, brocade of gold and silver, and thread of ditto, and cotton lace, embroidery, &c.

CLASS IV.—Articles which pay rates of thirty per cent, *ad valorem*; viz., perfumery of all sorts and fine oils for the toilet, false jewellery and bronze ornaments, &c., works of metal generally, scented waters and essences; alabasters, and works of; chandeliers of glass and metal, canes and sticks of reed, bamboo, &c., with or without mountings on handles, tassels of silk, or other materials; frocks and shirts, made up or in pieces; sofas and couches, carts and playthings for children, ribbons and tapes, &c., not otherwise rated, copper goods not otherwise enumerated, head-dresses and caps, window curtains and blinds, frames for glasses and pictures, plates of metal for furniture, writing desks, inkstands, &c., buttons of bone or wood, &c., musical instruments not otherwise enumerated (surgical and mathematical instruments, twenty per cent), lamps of all kinds, tombstones; books, plain; fine earthenware, watch keys, ordinary woods not otherwise enumerated; all kinds of furniture not otherwise enumerated; razors, ornaments for churches, manufactures of human hair, works of lead not otherwise enumerated, clocks, seals, scissors, dyes, sword-scabbards; glass, plain; and *all articles not specially enumerated in this tariff.*

CLASS V.—Specific Rates of Duties on the leading Articles of British Manufactures and Trade, at the rate of 100 cents, equal to 4s. sterling.

FINANCES OF VENEZUELA.*

	dollars	cts.	£	s.	d.
Home department	1,073,748	55	=	171,799	15 5
Finance department	1,150,656	00	=	184,184	19 3
Foreign affairs	32,400	00	=	5,184	0 0
War	575,359	29	=	92,057	10 0
Navy	91,291	48	=	14,606	12 10

Total expenditure 2,923,455 32 = 467,752 17 6

The actual expenditure of the republic, in 1846-1847, will not greatly exceed the official estimates of its income for the same period; namely, 2,076,202 dollars 68 cents, equal to 332,192*l.* 8*s.* 7*d.*

In these estimates are included the sum of 220,000 dollars, equal to 35,200*l.*, for

* The exchanges have been calculated at the rate of six dollars and a quarter to the pound sterling.

payment of a year's dividend on the Anglo-Venezuelan loan; and furthermore, 20,000 dollars, equal to 3200*l.*, for the payment of a year's dividend on the new Venezuelan bonds, issued in part payment of Mr. M'Intosh's claim.

The usual power to apply surplus revenue to the redemption of the foreign debt, of which the executive government was deprived last year, has not been granted to it by the present law; and looking at the increasing jealousy and prejudice against foreigners in Venezuela, I doubt much if this power will be again conferred upon the executive.

However, the usual amount for the gradual redemption and payment of the dividends on the home debt, namely 152,850 dollars, equal to 24,456*l.*, has been allowed; and, as many members of congress are holders of the stock of this debt, there is no likelihood of the power or means for its redemption being diminished or withdrawn by congress.

The revenue from customs' duty, the chief resources, and the mine revenues, are estimated as equal to the expenditure, as Venezuela has hitherto maintained her public credit.

CHAPTER VIII.

MARITIME TRADE OF THE REPUBLIC OF ECUADOR, THROUGH ITS ONLY PORT OF GUAYAQUIL, FOR THE YEAR ENDING THE 31ST OF DEC., 1844.

At this port the whole trade of the year has been less than that of the preceding, owing to the continuance of the yellow fever, and to a failure in the crop of cocoa.

The fever kept away from the port many of the traders of the interior, where the chief part of the merchandise imported is consumed, and to the same cause may be attributed the smaller number of British and other foreign vessels that have entered, as besides the risk of the epidemic, they are subjected to quarantine in the other ports of the coast when proceeding from this; national vessels, therefore (the crews of which having undergone the disease are not supposed to be any longer exposed to it), have had a larger portion of the trade of last year.

Of the other exports it is only in cotton that there is much difference.

	lbs.	£
1843—Cocoa exported.....	15,338,970	value 170,433
1844 " "	8,565,500	" 103,788
1843—Cotton exported.....	80,000	" 1,920
1844 " "	256,550	" 4,618

Total.....	167	14,718	209,103 6	167	196,194 2

Of the merchandise imported during the last year there has been a falling off in European manufactures, principally of the finer qualities of cotton, and woollen, and of silks, owing to the continuance of the *mourning* which the people have been kept in by

the ravages of the epidemic, but the importation of liquors and articles of consumption for the table (chiefly Spanish) have been unprecedented.

It was decreed, in 1845, to augment and encourage the ship-building establishment at Guayaquil, by exempting all vessels built there from tonnage and anchorage dues, and the partial reduction of the duties on merchandise imported by such vessels. Foreign vessels to pay four reals, or about two shillings per ton; and every vessel of 50 tons, 8 dollars; from 50 to 100 tons, 14 dollars; from 100 to 150 tons, 16 dollars; from 150 to 200 tons, 20 dollars; from 200 to 250 tons, 22 dollars; from 250 to 300 tons, 24 dollars; from 300 to 400 tons, 26 dollars; from 400 to 500 tons, 28 dollars; above 500 tons for every 100 tons, 2 dollars. Value of a dollar about 4s. 3d.

CHAPTER IX.

STATISTICS OF PERU.

WE are unable to bring forward any regular account of the statistics of Peru. The uncertain, ignorant, anarchical character of the government, has prevented any systematic returns being made; notwithstanding that such returns are insisted upon being prepared by the republican constitution of the state: it is not, however surprising, that this constitutional law should, like the constitution itself, become a nullity. A people which could have endured the absolutism of a Gamara as president, is certainly not yet intelligently educated for self-government, nor for an appreciation of a comprehension of true civil liberty, or of sound commercial and fiscal legislation.

The effects of such an unprepared state for self-government, have been a course of pernicious administration, in regard to national industry and trade.

President Gamara established monopolies, and constantly interfered with the regular course of labour, enterprise, and trade.

He caused the shops and trades to cease their occupations, while his national guards, as he called them, were drilling; in order that those who did not belong to that body, especially foreigners, might be deprived of profiting by the hours when the national guards were acting as soldiers.

The coin was debased by alloy in various degrees. Foreigners, and especially British merchants, have suffered greatly by this debased coin. Exclusive of this, forged coin is prevalent; and valueless base metal is abundantly circulated.

False coin has even been issued, as is well known, from the public mints, as well as by private forgers.

Monopolies of the Guano trade, saltpetre, tobacco, salt, &c., were favourite schemes adopted by Gamara, and unfortunately since he has ceased to rule, a more enlightened spirit does not appear to direct the administration.

One person obtained a monopoly of the exclusive export of copper bars from

the mines of Lima. Foreigners were by a decree prohibited from fishing on the Peruvian coasts, under the penalty of confiscating their vessels.

By a decree dated the 29th of July, 1840, guilds of trades were established, to be composed of all individuals who shall exercise in Lima any craft or manufacturing trade; the object of the formation of these guilds was by compelling foreign artisans who may exercise any craft or trade in Lima, to become members of a guild, to subject them, under the plea of municipal regulations, to the same *forced loans* and *military exactions*, and requisitions to which the native members of such guilds are respectively subjected.

On the 14th of August, 1841, the government of Peru granted to Mr. William Wheelwright, for a period of ten years, the exclusive privilege to navigate vessels propelled by steam, or by any other mechanical power, along the coasts and in the ports of Peru.

The time for the duration of this privilege is to be counted from the period when any of Mr. Wheelwright's steam-vessels arrived in the Pacific; and of which the *Peru* actually arrived at the Chilian port of Talcahuano, on the 21st of September the same year; another, the *Chile*, arrived on the 5th of October. Both vessels entered Valparaíso on the 15th of that same month, and one of these, the *Peru*, arrived at Callao on the 3rd of the following month of November.—(See Pacific Steam Navigation hereafter.)

The government of Bolivia also addressed an order, under date of the 15th of October, to the governor of the littoral province of La Mar, directing him to facilitate, by all means in his power, the despatch of the steam vessels at the only port of Bolivia, La Mar or Cobija, and to allow of pontoons being thereat established, free of all duties, for the deposit of coals.

TRADE AND NAVIGATION OF PERU.

In order to show the progress or decline of trade in Peru, we introduce the following

RETURN of the Value, free on board at Cadiz, of Spanish and Foreign Productions imported into Peru in each Year from 1781 to 1795, both inclusive.—Calculated at the Exchange of 48d. per Dollar.

YEARS.	Value of Spanish Produce.			Value of Foreign Productions.			Total Value.

Annual Average Amount }	5,266,384 0	1,053,276 12 0	610,304 0	122,660 0 0	5,876,723 0	1,175,344 12 0

NOTE.—In the annual amount of the exports is included the amount of the money exported to China and the Philippine Islands; and also the amount of the money exported on account of the royal treasury. On account of the war, neither money, nor produce, was exported to Europe from 1779 to 1782, both inclusive; and only a very inconsiderable amount in 1783; which will account for the large amount in 1784. Subsequent to the year 1793, shipments of coca and bark were effected direct from Guayaquil to Cadiz, which will account for the falling off in the amount of produce exported from Peru during the years 1794 and 1795.

AN Approximate Calculation of the Value of European, United States, and Asiatic Produce and Merchandise Imported into Peru and Chili, in 1837.

STATEMENT of the Total Value of Exports from Peru, distinguishing the Country of Production in the Year 1837.

DESCRIPTION.	Value of Exports.	
	dollars.	£
Produce of Peru or Bolivia exported to Europe and the United States.....	7,327,548	1,465,509
Produce of the States of the Equator, New Granada, and Central America, on account of European, Asiatic, and United States importations into Peru.....	259,820	51,964
Total.....	7,587,368	1,517,473

The number of yards of British bleached cottons imported,

	Yards.
In 1839, was	2,237,316
„ 1840, the number amounted to	5,406,302

Showing an increase in 1840, of 3,078,686

The number of yards of British gray cottons imported,

	Yards.
In 1839, was	2,482,000
„ 1840, it was only	1,719,548

Occasioning consequently a decrease in 1840 of 762,452

In United States manufacture, say gray cottons, or domestics, there were imported,

	Yards.
In 1839	1,323,340
„ 1840	2,087,568

Thereby showing a nett increase of 764,228

The increase, however, is only visible in bleached cottons, as the gray cottons imported from England and the United States together, amount nearly to the same quantity for the two years, viz.:

	1839.	1840.
British	2,482,000 yards	1,719,548 yards.
United States	1,323,340 „	2,087,568 „
Total	3,805,340 „	3,807,116 „

The total import of bleached and unbleached cottons, in 1839 and 1840, stands therefore thus :

	1839.	1840.
Bleached	2,327,316 yards	5,406,002 yards.
Gray	2,482,000 „	1,719,548 „
American	1,323,340 „	2,087,568 „
Total	6,132,656 „	9,213,118 „
Total increase in 1840 over 1839,	3,080,462 yards.	

	pieces.
In 1839, there were imported of printed cottons	78,174
„ 1840	188,151

Being an increase in 1840 109,977

Which, estimated at 3 dollars = 12s. a piece, makes the value of the increase 329,231 dollars = 65,986*l.* 4s.

Cotton drills imported from the United States were preferred to those of Great Britain.

Cotton prints.—The Americans are improving in this manufacture, though it is not likely that, for many years to come, they will be able to compete with the British manufacturer.

Linens from Ireland are daily increasing in consumption, and have nearly driven out of the market German and French *Bretagnes*.

The export of Alpaco wool has continued to increase.

	quintals.	£	£
In 1838, there were exported	4,593	at 5	= 22,965
„ 1839	8,555	„ 6	= 51,330
„ 1840	13,000	„ 5	= 65,000

The export of nitrate of soda is becoming more valuable as a return :—

In 1838, there were exported	quintals.
„ 1839	73,510
„ 1840	113,780
„ 1840	176,876

The importations of quicksilver,

In 1839 were	2203 flasks.	1652 $\frac{1}{4}$ quintals.
„ 1840	4625 „	3491 $\frac{1}{4}$ „
Increase	2452 „	1839 „

Twenty-seven British vessels arrived in Peru during 1840, from ports in Great Britain :—7 direct to Arica from Liverpool ; 1 to Arica, calling first at Valparaiso, from Liverpool ; 16 from Liverpool direct to Callao ; 3 from London to Callao, calling first at Valparaiso—total 27. 34 arrived in 1839, and 14 only in 1838.

The value of British cargoes in 1840 was estimated at 1,190,000*l.*, from which deduct 60,000*l.* for remnants of cargoes sent on to Central America and Mexico, and there remains 1,130,000*l.*, to which must be added the sum of 500,000 dollars = 100,000*l.* value of British goods imported into Peru under the flags of all nations, from the deposit warehouses in Valparaiso, making the total amount of British imports consumed in Peru in 1840 = 6,150,000 dollars = 1,230,000*l.*

The tonnage of Peruvian shipping amounted at the latter end of 1840, to 6637 tons ; and the number of Peruvian vessels to fifty-six, namely—two ships, two barques, fifteen brigs, sixteen brigantines, three cutters, two pilot-boats, sixteen schooners ; fifty-six in all.

About one-half of their crews consist of English and American seamen, but by a Peruvian law, which is almost always evaded, no foreigner can be owner or master of a Peruvian vessel.

The capital employed in the import trade with Peru in 1840 was estimated at 6,900,000 dollars, equal to 1,380,000*l.*

The revenue of the Custom-house of Callao, on British imports, in 1840, yielded a gross sum of 1,200,000 dollars, equal to 240,000*l.*

The French, German, and American trade, had also considerably increased, as compared with its amount in 1838 and 1839.

Several French cargoes arrived, of which some were valuable, the direct importations from France, chiefly to French shopkeepers, have been greatly on the increase.

As an approximate calculation, the annual value of the French import trade in 1840, with Chile, Bolivia, Peru, Ecuador, west coast of New Granada, Central America, and Mexico, may be stated at 3,000,000 dollars, equal to 600,000*l.*

This calculation has been made by Mr. Perrin, the French consul at Cobija.

From Germany there have been no direct importations, still the business done, by shipments from Valparaiso to Callao of German manufactures, has been considerable, and two vessels direct to Valparaiso from Hamburg afterwards came down the coast.

The commerce of Spain continued gradually to increase, but a large proportion of the quicksilver imported into Peru passes through British hands on British account.

From the United States some valuable cargoes have been introduced in 1840.

The value of foreign goods imported from the deposit port of Callao into Guayaquil, are paid for in produce of the Ecuador, and in remittances in gold in coined ounces.

With Central America the trade to Callao may not, perhaps, have been so extensive during 1840 as in former years, which probably may have had its cause in the continued state of anarchy in that republic.

With Mexico, the trade of Peru had been at least equal in amount to that carried on in 1839, and no alteration appeared in the trade with California.

The Chilean trade with Peru has considerably increased, especially in the exchange of the productions of the two countries with each other.

From Asia no direct shipments to Peru have been made, but two cargoes from China arrived at Valparaiso towards the end of 1840, of which the whole assortments for Peru

were purchased at Valparaiso and sent down to Callao, and which promised to yield to the purchaser a fair profit.

RETURN of the Exports from Peru to Europe, and the United States, during the year ending the 31st of December, 1840.

Note.—Of the above quantity of bark, 731 quintals were for England; 1151 ditto for France; 749 ditto for United States; total, 2631. The remaining quantity, amounting in value to 4000l., is not given, but the difference was divided among the same countries.

Out of the above sums, bullion specie, to the value of 747,302½ 8s., was exported from Peru to Great Britain; to which must be added the returns in bills, 30,000l., thus making the total amount to Great Britain alone 777,302½ 8s. sterling, and the remainder 784,846½ 16s. sterling to other countries.

Chinchilla, 2400 dozen skins to England; 12 ditto to France; total, 2412 dozen.
 Copper ore, 9035 quintals to England; 2655 ditto to France; total, 11,690. Copper in bars, 1179 quintals to France; to Mediterranean; total, 1254.
 Cotton, 26,669 quintals to England; 4366 ditto to France; 2132 ditto to Genoa; 2174 ditto, uncleaned or 57 ditto in seed, to Great Britain and other countries.
 Hides, 7649 hides to England; 146 ditto to United States.
 Horns, none exported.
 Nitrate of soda, 176,876 quintals to England; 34,420 ditto to France; 6660 ditto to the United States; 6600 ditto to Hamburg; 2800 ditto to other countries.
 Sugar.—No sugar was exported to Europe during 1840; the markets on the coast having been found (principally Chile) more advantageous.
 Wool, vicuña, exported to Great Britain only. Ditto, sheep's, 23,731 quintals to England; 33 ditto to France; 145 ditto to United States; 525 ditto to Hamburg. Ditto, alpacha, exported to Great Britain only.
 Tin, from Bolivia, 347 quintals to England; 3626 ditto to France; 713 ditto to United States; 310 ditto to the coast.

Report on the Trade within the Consulate of Islay during the year 1843.

Imports.—This year presents the anomaly of a decrease in the value of British imports of 40,000*l.*, with an increase of nearly 4000 tons of shipping, entered in the port. The reason for this apparent inconsistency, was the diminished demand for British manufactures in the interior of Peru, on account of the continued revolutions and civil wars which have well nigh beggared all classes of society.

The *guano bubble*, that excited at first the cupidity of numerous speculators, having burst, has been the cause also of great and serious losses to several persons who entered into this trade, with hopes of realising speedily large fortunes.

The Peruvian government took advantage of their avidity, but the country has reaped no benefit whatever from this unexpected source of revenue, the whole preceeds having been swallowed up by a horde of government *employés*, jobbers, and speculators, in the capital.

The French trade has suffered equally, and is reduced to a very low ebb.

Exports.—The following is a sketch of the exports from Islay, in 1843, from official and private data.

Hard Dollars.—To England, 79,453 dollars. *Bars Pina, and Old Plate*, 20,980 marks, at 9 dollars, 260,820 dollars. *Gold*, 9870 marks, at 17 dollars, 167,790 dollars. *Peruvian Bark*, to England, 174 marks at 40 dollars, 6,960 dollars; to France, 234 marks, 9,360 dollars. *Sheep's Wool*, to England, 8,593½ marks, at 10 dollars, 85,932.4 dollars; to France, 457 6-10 marks, 4,576 dollars; to Hamburg, 288 marks, 2,880 dollars. *Alpaca Wool*, to England, 9935 1-5 marks at 26 dollars, 258,315.1 dollars.

Vigonia Wool, to England, 6740 lbs., at 1 dollar, 6,740 dollars. *Vigonia Skins*, to England, 2120 skins, at 6 rials each, 1,590 dollars.—Total value, 884,416.5 dollars = at exchange, 48*d.* sterling, £176,883 6*s.* 6*d.*

Vouchers are given for all the above charges when required.

The advantages enjoyed by Peruvian vessels over those under the British flag, are:—

First.—The coasting trade.

Secondly.—In the whale-fishery. All whale-oil caught under the Peruvian flag is free of duty, while that caught under the British flag is subject to a duty of twenty-five per cent, on a valuation of three dollars and a half (fourteen shillings sterling) per 100lbs. on black fish oil; and to the same duty on a valuation of ten dollars (two pounds sterling) per 100lbs. of sperm oil.

Thirdly.—Gold exported is subject to a duty, under the Peruvian flag, of three-quarters per cent; under the British flag, of one per cent.

Fourthly.—Silver exported under the Peruvian flag, three and three-quarters per cent; under the British flag, five per cent.

Fifthly.—Ali merchandise coming direct from Europe, Asia, and North America, in a Peruvian vessel, is allowed to pay twenty per cent of the duty on her cargo in documents of the exterior and interior acknowledged national debt, if consigned to a foreign house, and thirty per cent, if consigned to a Peruvian house; whilst a British vessel bringing the same merchandise is allowed to pay ten per cent only of the duty on her cargo in such documents.—*Lima, February 1, 1845.*

CUSTOMS' REGULATIONS AND TARIFF OF PERU.

According to the law in force, Callao is declared to be the only port of unlimited deposit, both as respects classes of goods, their port of shipment, and the time of their deposit; but goods may be deposited at the ports of Arica and Paita, for the period of two years, and at Islay and Huanchaco for that of eight months.

It was enacted, by the law of 1840, that the retail trade, and the whole trade of the interior of the country, shall, after the expiration of eighteen months, be alone carried on by natives and citizens of Peru, whose names shall be duly inscribed in the *Commercial Register*.

That mercantile houses for the import of goods can alone be established at Arica, Tacna, Islay, Arequissa, Callao, Lima, Huanchaco, Trujillo, Payta, and Piura; *with the limitation, however, of selling only by invoices, or unopened packages, and on no account by single pieces.* This Article is a violation of the British treaty.

By the same law, the duty of five per cent actually on diamonds and precious stones, jewellery with stones or without, fine pearls, wrought gold and silver, and pocket watches, has been reduced to three and a half per cent; namely, three per cent to the state, and half per cent for ways and means.

The tax, called "*arbitrios*," or ways and means, is collected by the *consulado*, and is exclusively set apart for the payment of the *interest of the home debt*.

All *linen, woollen, and cotton goods*, are to pay twenty-five per cent, as follows: twenty-three per cent to the state, and two per cent for ways and means; and those which formerly paid thirty per cent, are now charged with a duty of thirty-five per cent and forty per cent; namely, thirty-two and thirty-six per cent to the state, and three and four per cent for ways and means.

Duty on playing-cards, 3 rials=1*s.* 6*d.* the dozen packs; namely 2½ rials to the state, and ½ rial for ways and means. Soap duty, 7 dollars=1*l.* 8*s.* the 100 lbs.; namely, 6 dollars=1*l.* 4*s.* to the state, and 1 dollar=4*s.* for ways and means. Tobacco duty, 35 dollars=7*l.* the 100 lbs.; namely, 30 dollars to the state, and 5 dollars for ways and means.

The duty on flour, 3 dollars 5 rials=1*s.* 4*d.*; namely, 2 dollars 4 rials=10*s.* to the state, 4 rials=2*s.* for ways and means, and 5 rials=2*s.* 6*d.* for establishments of public charity. Wheat, the fanega of 135 lbs., 1 dollar 6 rials=7*s.*; namely, 1 dollar 2 rials=5*s.* to the state, 2 rials=1*s.* for ways and means, and 2 rials=1*s.* for establishments of public charity.

The following duties will be levied on the importation of foreign merchandise; viz., three per cent to the state, and one half per cent to the *arbitrios* (city-toll); on gold and silver manufactures, real jewellery, with or without stones, clock-work, watches, real pearls, precious stones of every kind, five per cent to the state, and one per cent to the *arbitrios*; amber, gold and silver thread and wire, leaves, and spangles, civet, musk, eleven per cent to the state, and one per cent to the *arbitrios*; on timber, iron and steel raw.

The following articles shall pay the same duties when they are intended for the consumption of the population of the *first rate* ports of the republic: anchors, oars, biscuit, wood, handspikes, levers, &c., pitch and tar, cordage, iron chain cables, nails of every sort, travellers (a kind of block), hooks and grapnels, ships' cooking utensils, fidds, sheet copper, tin, tow, sheet iron, linseed oil, talc lanterns, lard, paint, sheet lead, pulleys, salt-fish, blocks, grindstones, resin, sand minute glasses, sea lead and line, tobacco for chewing, tissues for sails and flags, salt meat (better known by the name of *carne*), zinc.

The articles enumerated above, sent from the magazines and warehouses of the Customs to Lima, or to any other place of the state, will pay the whole of the duty named in this article, or twenty-one per cent to the state and two per cent to the *arbitrios*.

Paying sixteen per cent to the state, and two per cent to the *arbitrios*:—

Tissues of cotton; blonds and tulles.

" flax; cambrie; handkerchiefs in pieces.

" " lace and tulles.

" " *Estopilles*.

" silk; and all other articles except *tissues* properly so called.

" " blonds and tulles.

" " " others with gold or silver.

" " " " others.

Paying twenty-three per cent to the state and two per cent to the *arbitrios*:—

Tissues and all articles not named in the foregoing or following tables, of cotton, of wool, of flax.

Paying thirty-two per cent to the state, and three per cent to the *arbitrios*:—Trunks for travelling, musical instruments, pianos; furniture—chairs and sofas, and their frames, beds, iron camp beds, desks: skins and leather—*cueros* of every kind, whole or in pieces—with or without hair, manufactured or tanned, white or dyed.

Paying thirty-six per cent to the state and four per cent to the *arbitrios*:—Hats and caps of every kind, boots and shoes, clothes (made up), furniture of every kind (except chairs and chair frames), pastes as provisions, vermicelli and other sorts, of every kind of flour, carriages of every kind.

The articles enumerated in the following table will pay *fixed* or *specified* duties:—

ARTICLES.	Duties payable			ARTICLES.	Duties payable		
	To the State.	To the Arbitrios.	TOTAL.		To the State.	To the Arbitrios.	TOTAL.

The following articles are *exempt* from *import duties*:—Animals of every kind (alive or not), gold and silver (in paste, bars, powder, or specie), wood (hoops—*flejes*, masts, staves—*duelas*), maps and globes, geographical and marine maps and charts, charcoal, sales of freights to the profit of citizens of the state, engravings and drawings, elements of drawing in books, engravings in sheets, grain (other than that destined for sale) seeds, plants (others than those destined for sale), clothes and other dressing apparel, specimens of natural history, curiosities, &c., coals; surgical, mathematical, and scientific instruments; machines and tools—*maquinas* of every kind, alembecs and others, and drawings or models of machinery, *herramientas* for mechanics, imported by workmen establishing themselves in the country, and in a moderate quantity; mining tools, tools; mercury, mercury—*azogue* (quicksilver), music in sheets or bound in volumes, church plate and ornaments;* tombstones and other stones cut for paving, &c.; printing presses, &c., sculpture, statues.

The following articles are *prohibited* to be *imported*:—Fire-arms of every kind, obscene pictures, shot and bullets, obscene books, lead (except sheet lead), gunpowder, bad provisions (which from their peculiar state might endanger the public health), tissues of wool, cloths *de estrella*, swanskin.

The following deductions will be made from the articles upon which a duty is levied in order to meet certain expenses:—

* The actual and final destination of the above article to be given.

Articles paying a duty according to the value . . 5 per cent $0\frac{1}{4}$ per cent

"	"	. 11	"	$0\frac{1}{2}$	"
"	"	. 16	"	$0\frac{3}{4}$	"
"	"	. 23	"	$0\frac{1}{2}$	"

"	specified	quicksilver		$0\frac{1}{4}$	"
"	"	other kind	}	2	"
"	"	exempt of duty	}		"

These deductions must be paid in specie, and immediately upon the merchandise being taken into consumption.

Foreign produce re-exported from the bonding warehouses will pay the following duties :—single bales, three rials; double, six rials; other kind in proportion; *silver* in chests and bars, four rials,

Native produce, under circumstances similar to the above, will pay, once for all, two rials.

The following duties will be levied instead of the specified duty :—Flour, in barrels or sacks, five rials per barrel or sack; wheat two rials per *fanega*. Those books which are allowed to be imported will pay six per cent of their value.

EXPORT DUTIES.

The produce of the soil and industries of the republic are exempt from all export duty, as also are the following articles :—Gold and silver thread and wire, spangles, lace, and other similar articles; copper.

The following articles, however, form exceptions to this general rule :—Gold and silver in any shape, cascarilla (Peruvian bark), saltpetre—paying on exportation abroad, cascarilla, two per cent of value; saltpetre, four per cent; coined silver, five per cent; coined gold, one per cent; gold paste or powder, two rials per ounce; silver manufactured, or old silver, four rials per mark; gold (manufactured), two rials per ounce.

When the foregoing articles are exported by national vessels, three-fourths of the above duties only will be levied.

TONNAGE AND PORT DUES.

All foreign vessels which discharge a part or the whole of their cargo in any port of the republic will be subjected to the following charges, payable at the port where they first discharge the whole or part of their freight :—Anchorage and port dues, five piastres per vessel; captain's, ship's complement, and health dues, five piastres per vessel; tonnage dues two rials per ton.

The amount of tonnage will be ascertained from the ship's papers or charters.

An export duty of two per cent is levied on bark, and of four per cent on nitrate of soda.

The *importation of small shot, coatings, and star cloths*, are altogether prohibited.

In addition to the above duties on the import and export of goods, the following additional duties are by the 81st and 82nd Articles thereon imposed, in lieu of the payments formerly made for crane, mole, and other local charges, such as for watching, portorage of goods to custom-house warehouses, and their stowage therein; namely, one-quarter per cent on goods chargeable with a duty of four per cent; one-half per cent ditto of eleven per cent; one-quarter per cent ditto of sixteen per cent; three-quarters per cent ditto of twenty-three per cent; one per cent ditto of thirty-two per cent; and one-half ditto of thirty-six per cent. Two per cent on goods chargeable with a specific duty, excepting quicksilver, on which the duty of one-quarter per cent is recoverable.

On the re-embarkation of all foreign goods, 3 rials = 1s. 6d. a package, or half a mule-load, say about 150 lbs. weight; 4 rials = 2s. on every box of silver.

The productions of the country are chargeable, for once only, with a duty of 2 rials

= 1s. (no measure or weight stated) upon their embarkation, disembarkation, or re-embarkation.

By Article 83 of the same law, "Every class of merchandise and produce which shall be conveyed directly from Europe, Asia, and North America, or by the Isthmus of Panama, to the principal ports of Peru, in foreign ships or consigned to foreigners, shall liquidate ten per cent of the total amount of the duties on their import payable to the state, in government *documents of retired officers' pensions, documents of the foreign debt, or documents of the home debt, and the remainder in cash.* If the said merchandise and produce shall be imported directly in foreign ships, and be consigned to Peruvian merchants, or in national vessels consigned to foreigners, they shall liquidate twenty per cent in the before-mentioned documents, and the remainder in cash; and if they shall be introduced in national ships consigned to citizens of the republic, they shall liquidate *thirty per cent in government documents,* and the remainder in cash. The foregoing are in violation of the treaty with England.

By Article 2, Commercial Code, the custom-house of Arica is allowed to make transshipments, solely, however, to the port of Cobija, levying 2 dollars = 8s. for duty on policies, and observing the legal formalities.

Foreign vessels may convey provisions, grass, and barley, to the minor port of Iquique, and to the Creek of Pisuquia, when there are no national vessels to convey these articles.

The period of deposit in the port of Arica shall be extended to three years.

The natural or industrial productions of Bolivia may be deposited in private warehouses, with the consent of the custom-house, without requiring any warehouse rent.

The custom-house of Tacna may permit the diminishing of the weight and the reduction of double packages for their more easy conveyance into the interior, requiring the memorial and other formalities, which, by the 71st Article, the collector of the customs ought to exact upon importations.

Importation.—The revisal of the ship's manifest by the consignee of the vessel shall take place within twenty-four hours after its delivery in the ports of Callao and Huachaco. In the port of Arica thirty-six hours, and in that of Paita, forty-eight hours are allowed for this revision.

Additions may be made to this manifest, but on no account any article abstracted, or its contents reduced.

When the alterations mentioned in the foregoing article shall have been effected, the consignee of the vessel shall present a second "general manifest," and also one in detail in the Spanish language, or on stamped paper.

His manifest must contain—the marks and numbers of the bales or packages; the description of article, quality, or quantity of the contents of the bale; the weight and quantity of articles not packed in bales.

The names of the "special consignees," who will answer for the genuineness of the articles intrusted to them (namely, that they are the *same articles* consigned to them by the merchant). The whole to be written in full, the margin free from writing, figures alone to be introduced, without either interpolations (notes excepted) or erasures.

Those articles, of which the consignee is unknown, shall be described in a supplementary document, and deposited forthwith in the custom-house.

One manifest to be sent to the inspector-general of public accounts, and the other will remain with the customs. No manifest will be considered, unless it conforms strictly with the above formalities.

The manifests being delivered, they will be compared, and if found correct, an order will be given (*papeleta*) for the unloading to commence, without which order the merchandise will be liable to be seized.

An exception will be made for the landing of samples of small value.

Merchandise must not be unloaded before six in the morning, nor after two in the afternoon, from the 1st of May to the 1st of November; and not after three o'clock in the afternoon during the remainder of the year.

The entrance of the articles of the ship's cargo shall be admitted as follows, into the magazines and warehouses of the custom-house :—

Almonds, in sacks; wood in (timber); brandy, botijas; wines, in botijas; cacao; cocoa; candle-wicks (Pavilo); copper; iron; grain (wheat) and flour; nuts; origan; hides and skins, leather for saddles; paving-stones; rice; soap, native; salt and stones; tallow; sugar; tobacco, native; merchandises and drugs of every other kind, foreign or native, which do not pay duty. Articles relative to the complement of a vessel. Every kind of provision, except those enumerated above.

In order to introduce an article for consumption, three copies of a "Poliza," or import bill, must be made, containing the name of the importing vessel; the date of the "manifest in detail;" the marks and numbers of the bales, their contents, weight, or measure, quantity and quality, exact or approximate. A duty of four reals is levied upon this "bill."

Exports.—The discharge of the ship's cargo being completed, the captain shall certify the same on stamped paper, in which he must give a list of the articles, if any, still remaining on board. An inspection of the hold will then be made by the proper officer.

A *clearance* permit will be given by the customs, free of expense, and which must be written on the following description of paper: for foreign vessels, paper of three piastres; national ditto, ditto stamped.

Re-exportation—The re-exporter from the bonding warehouse must present three "demands," on ordinary paper, for which he will pay—to re-export abroad, one piastre; to a national port, four rials.

In transporting the cargo of one ship to another in the Port of Callao, two "demands" must be sent in, which will cost, if the cargo is destined to go to a foreign port, two piastres, ditto to a national port, ditto.

The following articles are considered as being included under the head of ships' provisions and ships' necessities, and pay no duties except *bonding* fees, &c.: biscuit, salt fish, tobacco for chewing, salt meat, anchors, oars, wood, handspikes, levers, &c., pitch and tar, iron chain cables, nails (clavos) of every kind, cordage (jarcia) ditto, travellers (a kind of block), hooks and grapnels, cooking utensils, sheet copper, tow, fish oil, linseed oil, talc lanterns, soot, paint, pumps, blocks, grindstones, sand-glasses (half minutes), sounding-lead and line, tissues for sails and flags, zinc plates.

When captains of men-of-war desire to send the wages of their crew to Callao, they must procure the note-of-hand of the governor of the station. If the amount is in hard dollars, or in ounces of gold, an export duty will be levied upon the money.

Coasting Trade.—The coasting trade can only be carried on by national vessels,* with the exception of a few articles, and the produce of the country, or such merchandises as are free of duty,—to the Port of Callao, *via* the ports of Arica and Islay, when there are not any national vessels loading at these two latter ports.

The following are considered secondary ports—Iquique, Ilo, Pisco, Huacho, Santa, Pacasmayo, San José de Lambayeque.

The following are *qualified* roadsteads only for exporting the produce of the country—Sama, Cocotea, Mejillones, Nasca, Chincha, Cerro-Azul, Chaucay, Supe, Pisagua, Quilca, Huarucev, Casura, Samauco, Sechura, Tumbes.

Bond Warehousing.—Callao is the only port in the republic where merchandise can be bonded for an unlimited term, without the payment of the duty on them. For the first *three months* no bonding dues will be levied.

For every month exceeding three, only one rial per *pieza*. By this is meant the *half* of a load, valued according to its bulk or weight, at six *arrobas*. If a month is commenced, that month will be charged in full.

Internal Trade.—The interior trade of Peru is exclusively reserved to the natives and citizens who are inscribed in the matriculation-book.

Mercantile houses for importation into the interior (*casas introductoras*) can only be established at the following places;—Arica and Tacna, Islay and Arequipa, Callao and Lima, Huanchaco and Truxillo, Paita and Piura. These houses must sell their goods by wholesale, and not in separate parcels, under pain of forfeiting a penalty of 500

* In the *first-rate* and *secondary* ports, and the *qualified* roadsteads.

piastres, to be the reward of the informer; such penalty to be levied by either the tribunal of the *consulado* or the *commercial judge* of the place.

All products of the soil of the republic are allowed free circulation with the exception of the following:—gold and silver, in paste, in bars, and in powder. These must be accompanied by an “*acquit-à-caution*,” brandy, wines, tobacco. Other articles taxed with a duty.

The customs’ duty must be paid at the first place of importation.

Transit by Land.—Arica is the only place of transit for the imports and exports of the Republic of Bolivia.

The bonding warehouses at Arica will receive goods re-exported from those at Callao by national and foreign vessels, for the trade of the interior. The produce and manufactures of Bolivia will also be received in the warehouses, to remain in bond for exportation.

CHAPTER X.

BOLIVIAN TARIFF DUTIES AND TRADE.

1. THE ultramarine effects which may come into the republic of Bolivia by the land frontiers from the 1st of January, 1845, shall pay duties in the following proportion.

2. Ultramarine liquors and foreign cacao, thirty-six per cent.

3. Perfumery, clocks for tables, or watches, cards, cigars, women’s shoes, caps of every kind, desks, iron or brass bedsteads, chairs, sofas, toilette glasses, lanterns and lustres, candlesticks, every description of mercery, foreign gold lace, tocuyos (grey shirting), and every other article to which this law assigns no direct duty, twenty-eight per cent.

4. All woollen goods, silk ditto, linen embroidered, lamas, lamillas (cloth of gold), tissue, eighteen per cent.

5. Earthenware, glass, crystal, and writing paper, eight per cent.

6. Gold and silver ornaments, precious stones, and ironware.

7. *Articles free from all Duties.*—Cattle, comestibles of the first necessity brought into the republic. Also are free from all duties, on their introduction into the republic, raw cotton, raw wool, cotton-thread, and woollen ditto, vulgarly called *caito*, excepting rice, which is to pay forty per cent.

8. All importation of foreign merchandise which may enter the republic, shall pay, besides the duties prefixed by this law, a medio per cent for the funds of the Chamber of Commerce in the capital in which they are consumed.

9. Books introduced into the republic by its land frontiers shall pay six per cent, applicable to the funds of the library of the capital where the expenditure takes place.

10. The government is authorised to lower the duties which in the republic weigh on the products of the industry of the neighbouring states, as soon as it obtains from them securities that in these states will be observed the corresponding reciprocity as regards the products of Bolivian industry introduced into their territory. It is authorised to fix the duties on coined silver and gold, or on bullion on their extraction from the republic, as well by the land frontiers as by the port of Cobija.

11. From the 1st of January, 1845, the introduction of gunpowder is prohibited into the republic, either by its land frontiers or by the port of Cobija. Matches (*fosforos*) are also prohibited.

Dated, Illustrious and heroic city of Sucre, 2nd of November, 1844.

JOSE BALLIVIAN; the Minister of Finance, MIGUEL MARIA AGUIRRE.

In 1846, two Englishmen at Corocoro, a place long famous for copper ores, are said

to have discovered a silver mine of immense dimensions in the province of Inquisivi, department of La Paz.

VALUE of Goods and Duties collected in the Custom Houses of La Paz, Oruro, and Cochabamba on Ultramarine Merchandise imported into Bolivia, by her Land Frontiers, in the Year 1840; and of the Value of Coined Money exported to Peru; and of the Duties paid thereon by the Exporters from this to the Peruvian Republic.

Ministry of Finance, Sucre, Feb. 15, 1841.

COBIJA is the only legal sea port in Bolivia. There are ship-building yards established in it, and the vessels built have privileges conferred upon them. The duties levied at the custom-house of Cobija on foreign merchandise imported during the year 1840, amounted to 103,951 dollars two and a-half rials, equal to about 20,790*l.* sterling.

A quay, barracks, and a new custom-house are the public works in progress, and a spring of fine water (a necessary of which Cobija was formerly deficient) has lately been discovered by an English engineer.

Number of foreign vessels which entered the port of Cobija during the year 1840:—English, thirty-three; French, fifteen; Spanish, three; North American, four; Sardinian, four; Mexican, one; Granadian, one; Ecuadorian, two; Chilian, twenty; Peruvian, fifteen; total, ninety-two.

Population in 1843—Males, 322; females, 283; male children, 105; female ditto, eighty-three; total, 793 inhabitants. Births in the year—Males, twenty; females,

twenty-six ; total, forty-six. Deaths—Old persons, three ; adults, twenty-one ; children, thirty-six ; total, sixty. Marriages, five.

The garrison, and men employed as labourers in the different mining establishments on the coast are not included in the above statement.

Ships which have anchored in the port during the year 1843, not including the steam vessels, ships of war, and sailing packets:—English, twenty-one ; French, twelve ; North American, seven ; Chilian, twenty-four ; Spanish, three ; Belgian, one ; Sardinian, four ; Peruvian, seven ; Hamburgers, eight ; Danish, four ; total, ninety-one.

Two *primary* schools exist in Cobjia, one paid by the state, the other a private establishment. The town possesses besides an hospital, a druggist's shop, seven mercantile warehouses, eleven shops—to sell in retail—well supplied with foreign goods ; seventy-eight chandlers' shops (*pulperias*), seven bakers, five tailors, two shoemakers, three principal eating and lodging-houses, two inferior eating and lodging-houses, two billiard-rooms, four large mining establishments with 120 labourers, and three smaller ones with thirty labourers.—Cobjia, January 1st, 1844.

CHAPTER XI.

STATISTICS OF CHILE.

THE administration of the affairs of Chile, has been far more regularly and justly executed than that of any other Spanish American republic. The condition of this state has, consequently, been more prosperous.

We have little data as to the trade of Chile under Spain, as a great part of its commerce passed through Peru and part through La Plata. Some time after the independence of Chile, the foreign trade opened round Cape Horn with Europe, and it was increased to other parts. In 1824 the value of imports were estimated at 11,500,000 dollars, and the exports of gold and silver at 80,000 dollars, and of agricultural products of 4,000,000 dollars. This we consider but a vague estimate.

Revenue and Expenditure.—Chile has maintained her public credit amid war

and difficulty. In 1833, when the country required some assistance from turmoil, the public debt had accumulated to the enormous amount, for a small population, of about 10,000,000 dollars. In consequence of this burden, the President disbanded one-third of the standing army, and greatly reduced the civil expenditure.

In 1835, an equilibrium in the finances of the state was obtained, and more than 1,500,900 piastres of interior debts were paid off.

INCREASE of Revenue.

	piastres.		piastres.

Other Chilian articles of export, as wheat, flour, hides, cow-horns, wool, hemp, building timber, Chile hams, nuts, and tallow (from Mendoza, Argentine Republic).....		1,500,000	300,000	0 0
Total.....		5,699,768	1,139,913	12 0

NOTE.—The amount of the export of gold, silver, and copper is the average of the amount of these articles exported from 1836 to 1839, both inclusive, as shown by the returns presented to Congress by the Chilian Minister of Finance; but in this amount is not included money or bullion passing in transit through the port of Valparaiso as returns for foreign goods sold in that port for Bolivia, Peru, Equador, and the western coasts of New Granada, Central America, and Mexico; and for China and other countries.

THE TRADE OF VALPARAISO DURING THE YEAR 1840.

During the continuation of the war between Chile and Peru, from the end of 1836 to the middle of 1839, the exports from Europe were cautiously limited.

On the re-establishment of peace the small proportion of foreign supplies remaining in the warehouses of Valparaiso found a ready and profitable sale. But the intelligence of peace having reached Europe, supplies from England, France, Germany, and North America poured in during the latter end of 1839 and the whole of 1840, to an unprecedented extent, and infinitely disproportioned to the consumption of the inhabitants.

Thus the general tonnage of foreign shipping entered inwards during the following years amounted to, in 1837, 25,935 tons; of which, from Great Britain direct, 4533 tons; 1838, 24,198, from Great Britain, 4098 tons; 1839, 27,520, and from Great Britain direct 7507; in 1840, 45,512 tons, from Great Britain 11,010 tons.

During the former years, and until the middle of 1839, Valparaiso was the port to which the merchants and dealers established in those parts along the coast of the Pacific, from Cape Horn to the most northern part of Mexico (who, having rarely any direct communication with Europe), came to purchase the larger portion of their supplies. The blockade of the entire coast of Mexico having cut off all commercial communication on that side, had considerably increased the demand from hence, and the exportation from this country of European commodities would have been still more extensive had the event been foreseen, and articles, in a sufficient quantity, suited to the demand of that market, been provided.

The Bolivian market is the only one with which the transit trade has increased.

The value of European goods existing in Valparaiso at the end of 1840, was calculated at 14,000,000 dollars.

The trade between this state and her majesty's Australian dominions has rapidly increased during the year 1840, as compared with that of 1839, but as the exportation, composed of raw produce, must depend materially on the favourable or unfavourable nature of the harvest in those territories, a sound inference can scarcely be drawn.

The departures, in the two above-mentioned years, have been—

	From Talcahuano.	From Valparaiso.
1839	281 tons	724 tons.
1840	1687 „	4701 „

with cargoes, principally of corn and flour, and an occasional vessel loaded with mares and other beasts of burden.

The imports are trifling, consisting of sheep and articles of small account, though numerous vessels seek these ports in search of freight for Europe or elsewhere.

The commercial importance of Valparaiso, the principal seaport of Chile, shows a state of prosperity and confidence in the stability of the government.

While in 1834 only 450 vessels aggregating 77,700 tons entered this port, the proportions in 1842, were as follows:—

Men-of-war	44	} 187,453 tons.
Steamboats	24	
Commercial vessels	617	

During the year 1842, the commercial movements in all Chilian ports—Valparaiso, Coquimbo, Copiapo, Constitucion, Talcahuano, Valdivia, and Chiloë—together were:—

<i>Entries</i> .	{ Men-of-war	48	} 339,019 tons.
	{ Trading vessels	1173	
	{ Steamers	112	
<i>Departures</i>	{ Men-of-war	54	} 328,288 tons.
	{ Steamers	111	
	{ Trading vessels	1209	

The customs' revenue of which amounted to 1,936,328 piastres.

Transit Trade.—At the custom-house of Valparaiso, there were, on May 31, 1842, 722,472 bales of merchandise.

The value of which was	7,159,036 piastres.
And coined metals to the amount of .	3,260,833 „
	<u>10,419,869 „</u>

AMOUNT of Shipments to Valparaiso, during the Year 1840, from England.

The navigation of the Port of Valparaiso with foreigners, in 1842, compared to 1841, underwent a diminution of twenty-six vessels, measuring 1659 tons.

The French movement has not suffered: there was in the navigation between Valparaiso and France, an augmentation of eight vessels, and of 2585 tons. The intercourse, according to the preceding table, was effected exclusively under the French flag. The table of the French customs makes it (inward and outward bound, together) thirty vessels measuring 7253 tons. Of this number, one single vessel only belonged to a foreign flag.

Trade.—There is no official account published of the Chilian trade with the foreign

states. The continuation of hostilities between Peru and Bolivia, the suspension of relations with Guayaquil, the population of which has lately been diminished by the yellow fever, have, in 1842, caused a great decrease in the trade of the Port of Valparaiso.

Although the French vessels brought to Chile in 1842, took but inconsiderable cargoes, their sale was effected with unsatisfactory results, though without loss.

The most favourable period of the year for arrivals is the first fortnight of September. On the 18th of the month the principal national *fête* of the country takes place, and the public rejoicings attract many strangers to Valparaiso, who profit by this circumstance to make their purchases.

Lyons *silks* remain without competition in the market of Valparaiso, for their fine qualities and the finish of the designs. The *shawls* of levantine and serges were also in demand, but subject to the caprice of fashion. The French made embroidered *shawls*, China crapes, scarcely compete with those of China, where labour is so poorly required.

French *wines* had, for some time, sold well, but too many imports, for the wants of the place, caused a fall, in 1842, of one half in price, from twenty-four to ten piastres.

THE Average Charges for Freight during the Quarter have been :

CHILIAN TRADE WITH FRANCE DURING THE FIRST SIX MONTHS OF THE YEAR 1843.

Navigation.—The number of vessels under the French flag, which arrived at Valparaiso during the first half year of 1843 increased in a remarkable manner, compared to the same period of 1842.

The arrivals amounted to twenty-six vessels of 7248 tons; and the departures to twenty-five vessels of 6401 tons. Ten vessels came direct from France, and seven were fitted out for this destination.

Trade.—The French products bought at Valparaiso sold off well; but not merchandises destined for Bolivia and Peru, countries where political dissensions continue to be very prejudicial to commercial operations.

The French manufactories begin to reap, in Chile, the fruit of the efforts which they have for some time made, to augment their transactions and struggle against foreign competition. Several French articles of silk have latterly obtained at Valparaiso a marked preference over similar Chinese products.

A fact to be remarked is, that France has succeeded to excel, in Chile, in its own silks, the *satins*, *serges*, *listonnerie*, *gros de naples*, and the *sewing silk* of China. Thus,

black *satins* of China, thirty-three inches broad, remain without buyers at the price of eleven rials, whereas black *satins* of France place themselves easily at twenty rials. The *serges* of China, offered at eight rials, and that of France at eleven rials; *gros de naples* of China, called *glazed*, of twenty-six inches in breadth, sells with difficulty at five rials; and that of France, of twenty-two inches, fetch from nine to eleven rials. The *listons* of China are completely neglected. In a word, French *silks* in general, have obtained a favour which was justified by the good quality of the stuffs exported. These facts will fix, no doubt, the attention of the French export trade.

China, besides, imported formerly by wholesale into Chile, *shawls* of *levantine sergées*, embroidered; the imitations which the French make of these tissues, are dispersed over the market, where they exclude those of China. A recent exportation of this French article has had equal success at Lima.

France has until now exceeded, in Chile, in the sale of shawls: by the elegance of their designs, the splendour of the colours, and particularly by the shades, *lilac, violet, lavender*, which the Chinese never could import, as they arrived nearly always *worm-eaten*, or damaged. But China still distinguishes itself by the quality of the principal material which it uses, by the strength of its shawls, the fringes of which are fuller than those of France.

Shawls, embroidered in the loom by machine, which the French designate *Chinese shawls of two colours*, cost in China, in the beginning of 1843, six piastres; similar French articles could not then be established for less than from forty francs to forty-two francs; and although the progress of the French manufactures have enabled them to be produced at a lesser price, the advantage is still on the side of China.

Ribbons are furnished almost exclusively by Switzerland and Germany.

IMPORTS into France from Chile in 1842.

CHILIAN MINES.

By an old Spanish law still in force in Chile, every encouragement is given to search for mines. The discoverer may work a mine in any ground, by paying five shillings; and before paying this he may try, even in the garden of another man, for twenty days. In the copper-mines, the men have little time allowed for their meals; and during both summer and winter they begin when it is light, and leave off at dark. (In Chile the summer days are shorter, and the winter days longer, than in England.) They are (at the mines of Jajuel) paid about one pound sterling a month, together with food. This food consists of sixteen figs, and two small loaves of bread for breakfast, boiled beans for dinner, and broken roasted wheat grain for supper. They scarcely ever taste meat. They have to clothe themselves and to support their families with this pound per month.

On arrival at the gold-mines of Yaquil (Jajuel), Mr. Darwin was surprised at the pale appearance of the men. The mine is 450 feet deep, and each man brings up nearly two hundred weight of ore. With this load they have to climb up the alternate notches cut in the trunks of trees placed in a zig-zag line up the shaft. The men (who are quite naked, except drawers) ascend with this heavy load from the bottom. Even young men, eighteen or twenty years of age, do this, although their muscular development of body is far from completed.

Mr. Darwin says, that the *apires* live entirely on boiled beans and bread; they would prefer the bread alone, but the masters, finding that they cannot work so hard upon this, insist on their eating the beans also. Their pay is from twenty-four to twenty-eight shillings a month; they leave the mine only once in three weeks, when

they stay with their families for two days. As a means of preventing the men from abstracting any of the gold, or gold ore, the owners establish a very summary and stringent tribunal. Whenever the superintendent finds a lump of ore secreted for theft, its full value is stopped out of the wages of all the men, so that they watch over each other, each having a direct interest in the honesty of all the rest.

The amount of labour they undergo is greater than that of slaves; being to a certain extent masters of their own actions, they bear up against what would wear down most men. Living for weeks together in the most desolate spots, when they descend to the villages on feast-days there is no excess or extravagance into which they do not run. They occasionally gain a considerable sum, and then, like sailors with prize-money, they soon squander it. They drink excessively, buy quantities of clothes, and in a few days return to the mines without a penny. It is observed by Mr. Darwin, that this thoughtlessness, as with sailors, is the result of the mode in which they are made dependent upon others rather than on themselves. Their daily food is found them, and they acquire no habitual care as to the means of subsistence; while the temptation to enjoyment and the means of paying for it occur at the same times. How different is this from the system in Cornwall, where the men think for themselves, and form an intelligent body.

The miners here spoken of are a different set of men from the *apires*, who are those that bring up the heavy burdens. The miners dig the ore from the bowels of the mine while the *apires* are simply labourers, much like the bricklayers' labourers, but who carry less heavy loads, and up a much less height. Mr. Darwin illustrates the extraordinary labour which the *apires* undergo:—"According to the general regulation, the *apire* is not allowed to halt for breath, except the mine is six hundred feet deep. The average load is considered as rather more than 200 pounds, and I have been assured that one of 300 pounds (twenty-two stones and a half), by way of a trial, has been brought up from the deepest mine! At the time the *apires* were bringing up the usual load twelve times in the day, that is, 2400 pounds from eighty yards deep; and they were employed in the intervals in breaking and picking ore. These men, excepting from accidents, are healthy and appear cheerful—their bodies are not very muscular. They rarely eat meat once a week, and never oftener, and then only the hard dry *charqui* (dried beef). Although with a knowledge that the labour is voluntary, it was, nevertheless, quite revolting to see the state in which they reached the mouth of the mine; their bodies bent forward, leaning with their arms on the steps, their legs bowed, the muscles quivering, the perspiration streaming from their faces over their breasts, their nostrils distended, the corners of their mouth forcibly drawn back, and the expulsion of their breath the most laborious, each time, from habit, they utter an articulate cry of 'ay-ay,' which ends in a sound rising from deep in the chest, but shrill like the note of a fife. After staggering to the pile of ores, they emptied the 'carpacho;' in two or three seconds recovering their breath, they wiped the sweat from their brows, and, apparently quite fresh, descended the mine again at a quick pace. This appears to me a wonderful instance of the amount of labour which habit (for it can be nothing else) will enable a man to endure."

At a copper-mine Mr. Darwin was told that the Chilian miners had no conception of the value of copper pyrites (a rich ore of copper) until informed of the circumstance by miners from this country: the Chilians laughed at the English for entertaining such a notion; but the English afterwards turned the laugh against them, by making a profitable use of some veins of this ore, which they had bought for a mere trifle.

The mining system of Chile is generally conducted as follows:—There are two principal persons concerned in almost every mine, the *proprietor* and the *habilitador*: the first, or the actual miner, lives at his hacienda or farm, and attends to the details of working the ore. The *habilitador* resides at one or other of the sea-port towns; he is the mining capitalist, by whose means the miner is enabled to proceed with his work. The *habilitadores* are generally diligent and prudent men; the *proprietor* or miner is too often improvident. The *proprietor* farms his own ground, obtaining from his farm vegetables and sometimes live stock for the subsistence of his miners. The melting-house is also generally built on his hacienda, and the ore is brought to his door on the backs of mules. These farmer-miners rarely work a mine with their own unassisted capital; they are seldom wealthy, and when they are so, it is found more advantageous to share with

the habilitador, who takes charge of the business part of the concern. The miner is frequently without funds, and is at the mercy of the habilitador, who makes what terms he pleases.

The Chilian system has, however, undergone some change by the introduction of foreign capital.

There are at Coquimbo some considerable French trade-houses. Mr. Lambert, who was educated at the Polytechnic school, in France, has constructed reverberatory furnaces, said to be the best in Chile.

Coquimbo is the centre of the copper-mine trade, and Copiapo of the silver-mines. It has been calculated that this latter port sent to Europe, by way of Valparaiso, from 1831 to 1841, twelve millions of piastres worth of silver, in bars, about 2,650,000*l.* sterling

A great number of foreign vessels, who visit the coasts of the Pacific Ocean, go to Coquimbo, Huasco, and Copiapo, to bring away copper ore, chiefly for England and the United States.

The mines of the province of Coquimbo are in the Cordilleras, and in the hills toward the sea, and in the chain of mountains of the interior. The richness of the ore have caused these mines to be chiefly those explored.

By a law of the Chilian congress which came into operation in 1841, the *exportation of flour and corn is free of duty.*

By a law, dated March 8, 1841, *foreign wines and spirits* pay a *transit duty* at the

Rate of, per case or cask, of twelve bottles $\frac{1}{2}$ rials per month.

„	per cask, under 9 gallons	$\frac{1}{2}$	„	„
„	„ from 10 to 20 gallons	1	„	„
„	„ „ 21 to 30 „	$1\frac{1}{2}$	„	„
„	„ „ 31 to 60 „	$2\frac{1}{2}$	„	„
„	„ „ 61 to 80 „	3	„	„
„	„ „ 81 to 100 „	4	„	„
„	„ „ 101 to 120 „	5	„	„
„	„ „ 120 and upwards	6	„	„

Hides with the hair on, skins of Guanaco, Vicuna, or Alpaca; wool in the fleece, washed or unwashed; suet or fat; tallow; common salt in stones or bags, with the exception of salt in small boxes; silver bullion; silver, wrought or unwrought; trinkets, of gold, of silver, or precious stones, imported in transit, upon re-exportation by sea, are charged with a *transit duty* of two per cent, with the exception of metals in bullion, in a wrought or unwrought shape; and of trinkets of gold, of silver, or of precious stones, which are only charged, on re-exportation, with an *ad valorem transit duty* of one-quarter per cent. None of these articles, however, if cleared from home consumption, pay any transit duty at all, but simply the import duty. And, in either case, whether cleared for home consumption or for re-exportation, for each bill of entry the customs claim *two dollars* currency.

By a law dated December 30, 1840, *copper minerals*, calcined or in “eyes,” when exported to foreign ports are charged with a municipal duty of one and a half per cent.

CHAPTER XIII.

CUSTOMS REGULATIONS AND TARIFF OF CHILE.

A DECREE establishing a statistical board was passed in 1843. Copiapo declared a major port. Importation of foreign coal permitted through the ports of Papuda, Tongoi, Totoralillo, Chanarol, Pena Blanca, and La Herradara; but only from major ports. Bills of health must be brought by vessels signed by Chilian consuls.

TARIFF OF THE OFFICIAL VALUATIONS OF NATIONAL AND FOREIGN MERCHANDISE.

THE Chilean Custom Duties are generally levied on the Valuation. Duties on the Value are levied according to a specified Tariff of Prices as follows :

IMPORT DUTIES.	Valuation.	Ad Valorem Duty.	IMPORT DUTIES.	Valuation.	Ad Valorem Duty.
	pia. cts.	per cent.		pia. cts. ad valorem.	per cent. ad valorem.

CHAPTER XIV.

STATISTICS OF BUENOS AYRES.

THE civil war under Rosas has annihilated the means of compiling any late return upon which reliance can be placed, regarding the trade and statistics of Buenos Ayres.

Under Spain the trade of Buenos Ayres consisted in exporting the precious metals, and salt beef, tallow, fine furs, sea wolf-skins, wool, sheep-skins, flour, oil, copper, hides, &c. To the interior provinces of Peru, were exported Paraguay tea, swan skins, negro slaves, thread, &c., in exchange for sugar, cacao, cinnamon, rice, indigo, cotton, oil, pimento, wax, baize, woollen goods, quicksilver, &c.

From Europe, La Plata received linens, woollens, silks, cottons, hats, iron, &c., and the imports were estimated, in average years, at 758,400*l.* per annum, whilst the exports amounted, in agricultural produce, to the value of 434,000*l.*, and in gold and silver to 1,183,400*l.* The whole estimated total value of exports amounted to 1,617,400*l.* sterling. The vicerealty formerly remitted 700,000 piastres, at 4*s.* 4*d.* each, to the royal coffers of Spain.

In 1828, sixty-four British ships of 12,746 tons entered the port of Buenos Ayres.

REMARKS.—The average exchange of the year at which the Returns of Trade are calculated, is 7*d.* per current dollar of Buenos Ayres. Although the British vessels which have arrived in this port during the year have decreased in number and tonnage, yet the value of the goods imported in them has not much diminished; say about 10,000*l.* sterling.

The produce of this country, exported in the course of the year, has augmented in value, about 145,000*l.* sterling more than last year, of which increase the British merchants have partaken in fair proportion, and have sent home large returns for our manufactured goods.

The quantity and quality of the wool now furnished from this province, is gradually on the advance, and must prove highly advantageous in our commercial relations with England. The foreign trade with Buenos Ayres continues much the same with respect to imports, but the exports of produce have been much increased.

TRADE OF BUENOS AYRES DURING THE YEARS 1842 AND 1843.

General Trade.—The total value of the exports from Buenos Ayres during the year 1843 was valued at 41,423,000 francs (1,659,206*l.* sterling) being an increase of 5,702,000 francs (228,080*l.*) over the exports of the preceding year.

French Trade.—The increase bore upon all articles, and the exports from Buenos Ayres to France have gradually ascended in the scale of importance.

Failure of Commercial Firms.—These favourable results were unfortunately broken off in the early part of the year 1844, by the failure of five of the principal commercial houses at Buenos Ayres; namely, four Argentine and one Brazilian: these failures were followed by the bankruptcy of several other smaller firms.

Amount of Liabilities.—The amount of their liabilities, according to official documents, was 24,000,000 of piastres, paper money, or 307,200*l.* sterling, and as the failures came one upon the other, the panic was very great in a market where the amount of paper money (the only legal currency) in circulation is 50,000,000 piastres, or 665,680*l.*

Causes of Failure.—The causes of these failures may be attributed to the great rage for speculation which seized the merchants during the war with Uruguay, and the blockade of Monte Video. They imagined that this latter port would not be able to export their principal article of trade, namely, skins or hides, they therefore purchased all the hides they could procure; and for this purpose they borrowed capital at the rate of two and two-and-a-half per cent per month, or if by the year, at interest of forty per cent! During this mania news was brought that large cargoes of hides had been shipped by European vessels for the European market, from the Rio Grande, to which the cattle had been driven and killed for provisions, and the skins were sold at a very low price, by Rivera and his men: the consequence of which was a loss, in the European markets, of twenty-five per cent on salted Buenos Ayrean hides, and of six per cent on dried hides. Although the several European houses established at Buenos Ayres were not entirely ruined by this loss, they all suffered more or less. The English firms, speculating in every branch of trade, had the most to bear, but the losses fell more directly upon those in Great Britain: at Buenos Ayres, they being only for the most part the consignees of English manufactures, they only lost the commission on the goods consigned to them.

British Trade.—The British trade being principally with the inhabitants of the town and country of Buenos Ayres, lost not only by this panic but also on the appearance of the Argentine army in Uruguay, which deprived it of its most safe outlet to market.

Trade with the Provinces.—European merchants do not attempt this trade on their own account, in consequence of the risks which it is exposed to.

Mode of Trading.—The products of Europe have to pass through several intermediate provinces before they arrive in those states of the confederation where they are purchased wholesale by native houses, and who confine themselves solely to this branch of business. They then sell them to other and less considerable dealers at a profit, and these again transmit them into the interior. For more than a year the blockade of the Parana has prevented the transit of goods to the richest provinces of Santa Fé, Cordova, and Corrientes, which are estimated, as engrossing two-thirds of the total trade of the interior. The only route open is by the provinces, which transport their produce to Buenos Ayres by land, namely, San Luis, Mendoza la Rioja. These take in return European manufactures, but their consumption being only a third part of the total trade, does not make up for the loss occasioned by the interdicting the navigation of the Upper Parana and of Uruguay.

French Trade.—This trade has suffered less than the English, on account of its being more particularly confined to the town of Buenos Ayres. French merchandise is rarely sent into the interior. Although French goods sell at a good profit; they are sent

interior by others, not by French merchants; who, being prudent, even stopped the speculations in hides in time to save themselves from loss.

Wine Trade.—The French wine trade suffered in the commencement of the year from the blockade of the rivers, but Spain having recently exported wines only in small quantities to the River Plate, wines from France found no competition in the market, and three different cargoes from Cette, Marseilles, and Bordeaux, sold at good profit.

State of Trade in May, 1844.—Goods of Parisian Manufacture in the Market of Buenos Ayres.—This branch of the French trade (*objets de l'industrie Parisienne*), is of some importance. In 1836, an average year, the articles of Parisian industry imported, were valued at 421,206 francs, or nineteen per cent of the total French imports, composed as follows: mercery or small wares, fans in pretty large parcels, white and straw-coloured kid gloves; those of too dark a colour, soil and fade at sea; bone, ivory, and tortoise-shell combs, brushes of every kind, metal buttons, with bone, ivory, and composition; walking-canes, and small looking-glasses; since 1836, the latter have been in much demand.

Articles of the Toilette for Men.—Since these have latterly been manufactured at Buenos Ayres, those of France are only imported with little profit; but articles of the toilette for women, such as lace, embroideries, dresses, caps, and bonnets, find a good market.

Stationery and Paper-hangings.—Under this head are included fancy gilt, enamelled, &c., paper, also pocket-books and pencil-cases; these articles are only used by the more opulent inhabitants, but not extensively, on account of the political state of the country. Stationery is mostly supplied by England, at least the superior qualities, the thinner and less expensive being French.

Perfumery.—The importations are considerable; but the profits small.

Hats and Bonnets, &c.—Few persons wear, at Buenos Ayres, felt hats; and Germany supplies silk hats. The latter are very cheap, and notwithstanding the duty of about three shillings per hat, the Germans find the trade profitable. French hats have not been able to compete with these.

Wrought Leather and Skins.—Those of Parisian industry rival competition; the consumption of boots and shoes for the army and for private use being very great. The profits are very limited, from the import duties being so very high, and the consumption being almost entirely confined to the town of Buenos Ayres; the arrival of two or three cargoes is sufficient to glut the market, and ruinously to lower the prices.

The interest for money lent at Buenos Ayres is one-half per cent per month; it has been at two, two and a half, and even three per cent per month.

French Wines.—The similarity of the French southern wines to those of Spain (which country formerly alone supplied Buenos Ayres), and their cheapness, will soon put down all competition. The imports have considerably increased, in 1843, particularly from the port of Cette. The French exports of wine during 1842 to Buenos Ayres and Monte Video amounted to 73,179 hectolitres; in 1839, the exports were only 41,419 hectolitres.

Trades, &c., in Buenos Ayres.—In the year 1843 there were in the town of Buenos Ayres, six armourers, twenty-nine inns and hotels, five breweries, fifteen jewellers, forty-five bakers, 459 eating-houses, including public-houses, six tanneries, thirteen chandlers, eighty-six boot and shoemakers, two auctioneers, four manufactories of chocolate, twelve manufactories of cigars, 905 vehicles (carts, waggons, &c.), thirty-nine consignee offices, two drug magazines, nine (livery-stable keepers) horse-dealers, 202 fruiterers and green-grocers, sixty-nine brick-kilns (*fours à briques*), twelve outfitters, nine watch and clock makers, four tennis-courts, fifty-five billiard and coffee-rooms, five job-carriage proprietors, four libraries, sixty-six wholesale warehouses (European articles), 222 retail warehouses (ditto), forty-three magazines for the products of the country (hides, wools, tallow, horns), 273 magazines for divers kinds of stuffs, ten mattress-makers, eleven mercery warehouses and manufactories, sixty-three corn-mills moved by horse and other power, eleven fashionable magazines, twenty-four typographical presses, thirty-two confectioners, twenty-six chemists and druggists, thirteen hardware houses, ten dyers, four carpet-manufactories, three manufactories of tobacco (cut), six manufactories of vermicelli 312 different kinds of industrial workshops kept by labourers or workmen.

French woollen cloth.—During the year 1841, after the raising of the blockade, there was imported from France, *cloths* of all kinds to the amount of 300,000 fr. (12,000*l.*) manufacturing price, a sum which exceeded a little, that of 1842. For the year 1843 the sales are not inferior to those of the previous year, notwithstanding the disadvantages resulting from the prolongation of the war between this country and Monte Video.

There has been sent from France, four qualities of cloth, the prices of which (in France) have varied from seven to twelve francs, from eleven to thirteen, from thirteen to eighteen, and from eighteen to twenty-four francs per metre. The sales were in the following proportions; common cloths, from seven to twelve francs could not meet English competition. Those of greater durability than similar English cloths have neither the lightness (which at La Plata is a quality), nor the lustre of the latter, nor are they so cheap.

The other qualities have sold in the following proportions: one-third of the value at from twelve to thirteen francs per metre, one-sixth, at from thirteen to eighteen francs, three-sixths at from eighteen to twenty-four francs. The qualities quoted at from seven to nine and ten francs have only sold in very small parcels, and generally at a loss.

French Modes.—The only colours that find a sale are, the dark and light blues called English blue, black, and bronze-black; these are the only ones which ought to be imported; the greens, the bronze-greens, and all that approaches to green is proscribed as being the colour adopted by one of the two parties at the time of the first civil war.

As to the quality, the buyers have generally preferred light cloths to those, which, though stronger and more solid, have not that silken and brilliant dressing so much sought after by the Argentines it is principally to the richer class of consumers that the French products have been sent; and the qualities sold at from eighteen to twenty-four francs per metre have equalled half the total consumption. The cloths worn by the common people are of two kinds; a blue cloth, rather deep, light, and brilliant, whose manufactured value varies from *five to six francs per metre*, resembling in strength and wear, the southern French cloths. Cheapness is the great consideration. It is bought chiefly for clothing soldiers and officers, and for cloaks called *ponchos*: the port-men, soldiers, and the officers of the police, and the seamen of the squadron, are entirely clothed with it.

The common blue cloths form half of the English importation; the remainder is of a small, fine kind of cloth, but particularly of a peculiar woollen tissue, a kind of molleton called bayeta, of a breadth of 160 centimetres and of a scarlet colour. It is now worn by both sexes. It is used for the lining of ponchos, for the *cherissas*, a piece of cloth of two metres in length upon the whole breadth of the stuff, which is used by the gauchos and cavalry soldiers. The peasant women make large shawls out of them; the Indians exchange their products for this cloth (the colour of which pleases them much,) when they are not at war with the Confederation.

N.B.—The flag of Buenos Ayres is not included in the above table.

CUSTOMS DUTIES AND REGULATIONS OF BUENOS AYRES.

The war and anarchy which has so long disturbed the Argentine states; the blockades and interruptions of navigation, which have driven trade into so many different and irregular channels, have caused that customs regulations and tariffs to have been far less regarded than in any of the other Spanish American republics. Contraband trade has consequently been carried on at such points as smugglers could the most safely and speedily run their goods, regardless of tariffs, into the country.

An illiberal scale of duties and prohibitions was promulgated by a decree, in December, 1835, that scale was modified in 1840 and 1841-2. By the decree of 1841, the following articles, which were before then prohibited to be imported, were admitted at various duties varying capriciously from twenty to fifty per cent on the value: viz.

Alphabets and spelling-books for the use of schools; *wheat*, at the rate of starch; rings of copper, bronze, and iron; handles of steel, iron, and common metal, for kettles, pails, &c.; cane-brooms; bullets of lead and cast balls; buttons and button-moulds of wood, horn, or bone; ormillas of one or more holes; steels for striking fire; iron buckles; bird-cages; *belts*, of cotton pure, or mixed wool; hoops for casks, &c.; tallow-candles; ploughshares, *of the shape of those used in the country*; bells for cattle; glue; kitchen-strainers and skimmers of tin, iron, or steel; axletrees of iron or steel; manufactured tin; all articles of iron-work for windows and doors; forms for hats, boots, and shoes; fringes for hammercloths, cloaks, &c.; galloons pure, or mixed with cotton or wool; window gratings; gridirons.

Clothing, articles of dress, &c.—Cloaks, called *buchos*; garters of cotton and of wool, pure or mixed.

All articles of copper and brass manufactured; butter moulds of iron; mustard, prepared; steel-yards; combs of all kinds; wheels for carriages; wooden pails; saddlery and harness; tissues for counterpanes, called *sobrepellones*, for horse-cloths, for cloaks, called *ponchos*.

The old tariff of 1835, appears to be thoroughly broken through, but we have no regular Buenos Ayres tariff which we can publish with any degree of accuracy, and the tariff of Monte Video hereafter introduced, may, until changed, be the probable average of the scale of duties to which goods will be subjected except those that will be run clandestinely past the customs.

Port Charges at Buenos Ayres.—The following is the last decree of the executive for levying tonnage duties at this port:—

The Argentine government has resolved, and does decree—

Article 1. From the 1st of January of the coming year, national vessels sailing from ports beyond sea, shall pay three dollars per ton.

2. Foreign vessels shall pay four dollars per ton, except those which, in virtue of existing treaties, are assimilated to national vessels.

3. Foreign vessels shall pay, for the visit of the health officer, twenty-five dollars, and the same amount for the bill of health.

4. Foreign vessels belonging to nations having no consul, and whose roll is made out by the captain of the port, shall pay forty dollars for it.

5. The duties fixed by the preceding articles shall be paid one-half on the entrance of the vessel, and the other half on her departure.

6. National and foreign vessels, which do not leave nor receive cargoes, shall pay one-half of the duties here established.

7. Let this decree be communicated, and published in the official register.

Until peace be re-established on the banks of the La Plata, we find it impossible to introduce any further commercial statements relative to Buenos Ayres.

CHAPTER XV.

CUSTOMS, REGULATIONS, AND TARIFF DUTIES OF THE REPUBLIC OF URUGUAY AND MONTE VIDEO.

THE commercial law in force in this republic is the old Spanish code, called the "Ordinanzas de Bilbao." The commercial regulations and revenue laws equally affect the commerce of all foreign nations. A discrimination is, however, observed in favour of national vessels, in regard to tonnage and other dues; also, a trifling difference in the direct tax of "licence to trade." British ships and their cargoes can, under treaty, claim the same privileges as Monte Videan vessels and their cargoes.

All laws affecting commerce are independent of local legislation, but emanate directly from the supreme government, and are liable to such changes only as the political exigencies of the republic may require.

The present revenue laws affecting foreign commerce are the following:—

1st. The custom-house law of June, 1837, establishing the rate of duty on imports and exports, and the different ports open to foreign flags.

2nd. A law, revised yearly, imposing a direct tax for licence to trade, in which a trifling advantage is secured to citizens of the republic.

3rd. An addition of sixteen per cent to the duties on imports, and five per cent on exports, were imposed to assist in meeting the extraordinary expenses of the war with Buenos Ayres.

4th. A decree, consequent on the declaration of war against Buenos Ayres, interdicting commercial intercourse with that state.

(It is stated, however, that no real obstruction is offered to the trade between the two countries, so far as relates to foreign flags.)

Customs' Laws.—The Senate and House of Representatives of the Oriental Republic of Uruguay, in Congress assembled, decree, &c., concerning importations:—

ARTICLE I. Free from duty—printing presses, paper, and other articles exclusively for this purpose; printed books; geographic maps; barks, for tanning; ashes; staves and hoops of wood; calf skins; cow and horse hides, raw; common salt; gold and silver,

coined or in bullion ; and live animals, for promoting industry and improving the breed of the country.

2. Iron, in bars, sheet, wire, or plates; brass and steel, unwrought ; tools, in general, except those expressed in article 6 ; woods ; saltpetre ; gypsum ; fossil coal ; fur, rabbit, hare, beaver, and other furs used for hats ; cables and cordage ; tar ; ornaments of gold and silver, and watches shall pay six per cent.

3. Linen cambrics ; silk, raw or spun ; fabrics of silk ; laces and ribbons of silk or linen ; gold and silver embroidery, and fine jewellery of gold and silver, shall pay ten per cent.

4. All goods and effects, natural or industrial, not expressed in the articles of the present law, and the common serge, called "bajaras," used for bags and other purposes, shall pay nineteen per cent.

5. Sugar ; maté ; tea ; cacao ; cinnamon ; sweet oil ; spices ; drugs ; provisions in general ; woods wrought ; and tobacco in leaf, shall pay twenty-four and a half per cent.

6. Wheat ; pastes of flour (as macaroni, &c.) ; biscuit ; starch ; cheese ; butter ; pork and beef in pickle ; trunks and boxes, empty or containing goods ; moveables ; hats ; manufactures of sheet tin ; lamp oil ; rings (large) of iron or brass ; false jewellery ; perfumery ; soap ; doors and windows with the iron-work therefore ; window grates and balconies ; spits of iron ; crowbars ; ploughshares of the kind used in the country ; shoes, for horses and mules ; tallow candles ; carriages of all kinds, not intended for carrying heavy loads ; saddles and horse trappings ; clothing, made up ; caps ; dress combs ; feathers ; artificial flowers and other ornaments for the head ; hosiery boots and shoes of all kinds ; china ware ; glass, cut, or gold figured ; mirrors ; liquors ; ardent spirits ; wines ; vinegar ; cider ; and chewing tobacco, shall pay thirty-one and a half per cent.

7. Flour ; meat, dry salted ; cigars ; and playing cards, shall pay thirty-five per cent.

8. *Storage duty (almacenage) on all articles deposited, viz. : one-eighth per cent per month on dry goods ; thirty-seven cents and a half on each pipe of liquids ; nine and three-eighths cents on each barrel of flour ; nine and three-eighths cents on each 203 pounds eight ounces (avoirdupois) of tobacco, yerba, sugar, and other articles of weight, except minerals, which shall pay three and one-eighth cents on the same weight ; and boxes of wine, liquors, or other liquids, which shall pay twelve cents and a half for every eight boxes.*

9. In case of doubt arising in relation to the payment of storage duty, from the effects not having been expressed in the present article, the duty will be collected on the weight, nine and three-eighth cents per 203 pounds eight ounces.

10. Hides, dry, bull, cow, ox, horse, twelve cents and a half : calf and colt skins, six cents and one-quarter.

11. Hides, salted, eighteen cents and seven-eighths.

12. Steers, heifers, breeding animals, and mules, one dollar.

13. Mares, colts, and geldings, 1 dollar 50 cents.

14. All products of the country, not comprehended in the foregoing articles, shall pay one quarter per cent on the market prices, as export duty.

15. The following are excepted : salt meat, wool, pulse, grain of all kinds, flour, tanned hides, and all works of art ; foreign goods which have paid import duty, those which clear to be discharged in ports inside of the capes of the River de la Plata, and those which may be warehoused for exportation, shall be free from duty.

16. Silver, coined and in bullion, one per cent ; gold of the same description, one quarter per cent.

17. Warehousing, as yet, is not permitted, except in the custom-house of Monte Video.

18. The length of the deposit is indefinite, so long as the articles continue uninjured.

19. The state is responsible for the value of effects deposited, except in cases of fire, the inculpability of those having charge being proven.

20. Goods deposited shall always be at the disposition of the depositors during the office hours of the custom-house, and the alcalde is obliged to order the stores to be opened at their request.

21. The introducers may effect sales by wholesale, without being obliged to remove the merchandise in warehouse.

22. The executive power is authorised to establish warehouses in any of the custom-houses of the state, under the restrictions which circumstances may demand.

23. By the present law, the following ports are qualified (*habilitados*) : Monte Video, Maldonado, Colonia, Soriane, Paisandee, Yaguaron, and the inland port of Tacua-rembo.

Transit.

24. Is permitted and free from all export duty : all foreign effects leaving the deposito of Monte Video for foreign marts, or for other depositos which may be established in any transit custom-house.

25. Is permitted and free from import duty, in transit from a foreign country into the state, the following articles : yerba maté, tobacco in leaf, cotton (raw or spun), hides and tallow, if their destination is to one of the qualified ports of the state.

26. Is also permitted, and free from duty, the transit for foreign ports of the effects expressed in the foregoing article, by way of the River Uruguay.

27. The government will establish rules necessary to advance this class of commerce, and retains the right of determining the precise points where goods in transit to foreign marts shall be introduced.

General Dispositions.

28. The duties will be regulated by the wholesale market prices ; the calculations to be made by a surveyor and two merchants, at the time of despatch of the effects at the customs' office.

29. The merchants mentioned in the foregoing article shall be comprehended in a list of twelve, which shall be formed every six months by the "tribunal del consulado," and who shall alternate by fours, each month, to be designated by the collector-general.

30. In case of disagreement between the surveyors, or objection on the part of those interested, for any difference which exceeds ten per cent, it shall be decided by the collector-general and two merchants, drawn by lot from said list, without recourse.

31. The judges, once assembled, shall not separate without having pronounced their decision, which will be carried into effect.

32. The operations of the surveyor and his colleagues shall be published, and the former shall be obliged to give account thereof to such merchants as may request it.

33. The government retains authority to establish special rules, in cases where, from local exigencies, the punctual execution of the dispositions of the present law cannot be obtained.

34. The dispositions of the present law cannot be altered until after six months from its publication.

35. Said dispositions shall take effect, with regard to importations from ports north of the equator, in six months from its publication ; from ports south of the equator, in three months ; from ports within the capes of the River de la Plata, one month : and in fifteen days on goods and effects in deposit.

36. The duties established by the law of the 26th of January, 1831, of one per cent "consulado," and one-half per cent "hospital," on imports, are comprehended in this law, and their respective products shall be separated and applied to the objects to which they are destined.

Addition to the Custom Laws of the State.

Article 1. All those effects comprehended in articles 4th, 5th, 6th, and 7th, of the general law, shall pay eight per cent as extraordinary subsidy.

2. Those effects designated in Article 5 as "provisions in general," woods wrought, wheat, pastes of flour, and flour, are excepted.

3. Common salt shall pay, at importation, twenty-five cents per three bushels.

4. Tallow, unmanufactured, shall pay, at exportation, eight per cent.

5. The foregoing articles shall take effect, with regard to importations from ports north of the equator, in six months from its publication ; from south of the equator, in three

months; from ports within the capes of the Rio de la Plata, in one month; and in fifteen days for articles and effects in deposit.

6. This law shall be revised next year.

7. In addition to the duties specified above, all articles of importations shall pay eight per cent as "subsidy," except flour, which shall pay no additional duty than the eight per cent "extraordinary," designated by the law of the 29th of March; articles of export, five per cent, and jerked beef thirty-seven cents and a half per 103 pounds.

DECREE.—*Foreign Flour.*

Article 1. When the price of this article is upwards of twelve current dollars, it shall pay, as a maximum, four dollars per barrel; and when the price is below ten current dollars, it shall pay three current dollars per barrel, as a minimum.—*Rondeau, Monte Video, June 11, 1839.*

DECREE.

Article 1. Fifteen days from the publication of the present decree, all goods which may be despatched from the custom-house, and which are subject to importation duty, shall pay eight per cent additional, as a war duty extraordinary, to continue until pacific relations shall have been established.

2. From and after the same date, all articles of exportation which are actually liable to duty shall pay five per cent additional to same.

3. The executive power is authorised to extend the operation of this law, so far as regards imports, to the further term of fifteen days, to be counted in succession.—*Monte Video, June 18, 1839.*

DECREE.—*Extra Duty.*

Article 1. Jerked beef shall pay three rials per quintal on being exported, from and after the 1st day of May next. This shall be continued two years, to commence from said date, in event of the especial circumstances by which the market of this republic is affected should not have definitively ceased.

2. Establishments which are liable for patents shall pay one-third more in 1841, in addition to that which corresponds to the present year, and during the said year of 1841 the stamp paper shall be subject to an additional twenty per cent.

3. All goods which may be despatched for consumption from the custom-house of the state, and which are already liable to duties (with the exception of wheat and flour), shall pay, after fifteen days from the promulgation of the present law, in addition to the custom-house subsidy law already established, eight per cent *ad valorem*; which recharge shall, however, cease from the moment the loan towards the payment of which the proceeds of the five and eight per cent subsidy extraordinary shall have been satisfied. The payment of the duties exacted by this law shall be paid in cash.

Sanctioned by the "Sala de Sesiones," in Monte Video, April 7, 1840, and its receipt acknowledged by the minister of finance on the 12th instant, at which date its fulfilment is decreed.—*Monte Video, April 1, 1840.*

Tonnage Duties and Port Charges on Foreign Vessels.—Tonnage duty, three rials, currency, per ton; guard on board, eight rials, currency, per diem; hospital fees, four dollars four rials, currency; entering and clearing, thirty-five dollars, currency; harbour pilotage, ten dollars, currency; custom-house vessel, one dollar, currency.

Pilotage from Cape St. Mary's to Monte Video.—Twelve feet pay 50 dollars; thirteen feet pay 60 dollars; fourteen feet pay 70 dollars; fifteen feet pay 90 dollars; sixteen feet pay 110 dollars; seventeen feet pay 130 dollars; eighteen feet pay 150 dollars; nineteen feet pay 180 dollars.

Port Charges on National Vessels from Sea.—Harbour pilotage, 2 dollars; tonnage duty, 2 rials per ton; entering and clearing, 10 dollars 6 cents. Coasting vessels pay no port charges.

Currency.—The currency of the country is computed in dollars, rials, and reis, viz.: —100 reis, equal to one rial; eight rials, equal to one current dollar.

The current dollar (nominal) is sixteen and two-thirds less than the Spanish (or silver dollar without pillars). The Spanish pillared dollar, and the patacone or patriot dollar, are equal to 960 reis, and twenty per cent more than the current dollar.

Doubloons, Spanish or patriot, are a legal tender for sixteen Spanish dollars or patacones; the former, however, generally command a premium of one per cent. All business transactions are settled in gold and silver coins.

Weights and Measures.—100 lbs. equal to 103 lbs. aovidupois; one quintal, equal to 100 lbs. Spanish; one arroba, equal to 25 ditto; one pesada of dry or ox hides, equal to 40 ditto; one pesada of salted ox hides, equal to 75 ditto.

Dry Measure.—One fanega of wheat, equal to 233 lbs. Spanish; one fanega of salt, equal to 590 ditto; a fanega is equal to three and three-quarters English bushels; a moyo of salt is about sixty English bushels, or two and a quarter tons, and averages about seventeen fanegas.

Liquid Measure.—In ascertaining the contents of casks of liquids, the same instruments are used as in England, and consequently all liquids are bought and sold by the gallon.

Long Measure.—100 yards English are equal to 108 varas Spanish; 100 varas Spanish are equal to ninety-seven varas Buenos Ayres.

* These are principally slavers in ballast after landing their slaves in Brazil.

† This number includes packets and pilot-boats.

In 1844 no produce of this republic has been shipped from the port of Monte Video in consequence of the war. Produce to a very great extent, which otherwise would have passed through this custom-house, has been shipped on all parts of the coast, principally at the port of Bucco, a few miles from this city, in the territory occupied by General Oribe's troops, and at Rocha and Castillos, villages between Cape St. Mary and the Brazilian frontier, occupied alternately by one or other of the two contending parties. The greater portion of the produce of this country is derived from the remote departments on the eastern side of the republic, and has been conveyed during the war to the neighbouring port of Rio Grande in the empire of Brazil, from which it has been exported to different parts of the world.

Total.....	570,943.160	3 7	102,293 19 9

NOTE.—The city of Monte Video being besieged and blockaded there have been no exports during the year 1844. All the produce which had been warehoused in Monte Video previous to the siege was exported during the year 1843. Large sums of specie have been shipped from this port, but as the greater portion has been smuggled on board, no correct statement can be made: the following sums, however, have been passed through the custom-house:—

CHARGES imposed by Public Authority on British Shipping in the Port of Monte Video.

CHARGES.	Currency.	Sterling.	CHARGES.	Currency.	Sterling.
	dlrs. reis.	£ s. d.		dlrs. reis.	£ s. d.

			Do. do. or.....	12 0	2 3 0

* * * Average rate of exchange, forty-three pence sterling per current dollar of 800 reis.

N.B.—No vouchers are given by public authorities for any sums paid by shipping.

The only difference which exists between vessels under the flag of this country and British vessels with respect to the charges made on them is, that the national vessels pay 200 reis per ton for anchorage, while British vessels pay 300 reis per ton. The same difference exists between national vessels and the vessels of all other countries.

At the present time there are no advantages enjoyed by national or other foreign vessels from which British vessels are excluded.

Formerly national vessels had the exclusive privilege of engaging in the coasting trade, and no foreign vessel could engage in it. This was, by a decree of the oriental government, done away with during the period when hostilities were being carried on against this city by the Argentine squadron, as foreign vessels could then only be employed in transporting cattle from different parts of the coasts of this republic to this city, then under a rigorous siege.

It is probable, however, that foreign vessels will be deprived of this privilege so soon as the war shall cease.

CHAPTER XVI.

COMMERCIAL LAWS AND TRADE OF PARAGUAY.

FROM the success which has attended the first attempt at opening a direct trade with Paraguay, and from the improved cultivation of that state, we are justified in concluding, that were a termination put to the unnatural and unjust war carried on by Rosas, and to the interruption which he has established to the navigation of the River Plate above Buenos Ayres, civilised nations might carry on a lucrative trade with Paraguay and the interior states of the Argentine Republic. Even the Dictator Francia manifested some desire to establish commercial relations with England. In 1841 Mr. Hughes, a British subject, proceeded with a cargo of merchandise to the port of *Neénbucú, Villa del Pilar*. He was well received by the authorities who succeeded Dr. Francia, and descended the river, having

left a considerable surplus of British manufactures in Paraguay, over the returns of country produce brought down the Plate by him. He was, however, prevented from re-ascending by Rosas.—(*See Mr. Hughes Letter hereafter.*)

CUSTOM-HOUSE LAW OF PARAGUAY.

Of Maritime Imports.

ARTICLE 1. All machinery, instruments of agriculture, science and art, all classes of geographic maps are free from duty.

2. Twenty-five per cent will be paid upon raw and spun silk, silk manufactures, network and laces, with or without embroidery of gold and silver, and with or without jewels—all clocks and watches—jewellery of silver and gold—and every work of wood.

3. Forty per cent will be paid upon all furniture, mirrors, carriages, saddles, and their appurtenances, ready-made clothing, hats, shoes, ponchos, horse-cloths, leathern manufactures, liquors, wines, spirits, vinegar, ale, cyder, tobacco, cigars, and all kinds of perfumery.

4. Three rials per fanega will be paid upon salt.

5. Fifteen per cent will be paid upon all natural productions and manufactures which may not be enumerated in this decree.

6. One rial for each package will be paid upon all articles and manufactures which may enter into deposit, if such deposit does not exceed the term of one month;—beyond this term two rials per month will be paid upon each package.

7. Gold and silver in coin or in bars are free from duty.

8. The ports of entry, established, *for the present*, by the sovereign congress of this republic, are the Villa del Pilar (Neémbucú) and Itapua.

Of Maritime Exports.

ARTICLE 1. Hides (ox, cow, calf) will pay in full two rials for each hide.

2. Horse hides will pay one rial for each hide.

3. Yerba maté will pay one rial for each arroba. Tobacco will pay four rials for each arroba.

4. All the productions of this republic, not included in the foregoing articles, will pay upon their exportation five per cent upon the current value.

5. All foreign articles and manufactures which may have paid import duties may be re-exported free of duty.

6. Also are excepted for a limited time, those who may prepare the indigo of the country for sale.

7th.—Those who may prepare twist tobacco according to the manner of Brazil, and snuffs; those who may establish the manufacture of vegetable oils; those who may manufacture flour of Mandioca, as it is prepared in Brazil; those who may preserve and augment the preparation of wines, spirits, and all classes of liquors; those who may establish wholesale factories for the making of sugar and soap; those who may prepare the grain dye of cochineal in the country; those who may establish mills for the cleansing of rice; those who may establish manufactories of pure and white wax, or who may set up hives of bees for the production of honey and wax; those who may discover and establish any other useful invention, and who put it into practice, shall also have the same privilege of freedom from duties in the manner expressed.

8. It is entirely prohibited in all the territory of the republic (as it has been hitherto), to export gold or silver, coined or otherwise, under penalty of confiscation, together with a fine to an amount equal to that which it is intended to export.

9. Goods deposited in bond will pay two per cent *ad valorem* upon their re-exportation.

The Manner of collecting Duties.

ARTICLE 1. The *ad valorem* duties will be fixed upon the current market value of the article, calculated by the collector and two merchants, at the time when the goods may be despatched from the custom-house deposit.

2. The merchants alluded to in the preceding article will be named by the collector.

3. In case of reclamation on the part of the importer, or that of the collector, and which may exceed ten per cent, the delegate or commandant, with two merchants newly chosen, will decide without appeal.

4. The arbiters met will not separate until they have pronounced their judgment, which will be carried into execution.

5. These operations will be public, and testimony will be given thereof, when required.

6. The avaluation effected as it is ordered by the first article of this chapter, and signed by the collector and two merchants, will be remitted to the supreme government for its deliberation.

7. From the present year the custom-house duties will be paid one-half in gold or silver currency, and the remainder as at present.

8. All decrees are hereby repealed, which may be in contradiction to this present, which shall be revised every year, for expedient purposes. And that this may reach the knowledge of all, let it be published, and copies affixed in all the customary places; and let testimonies thereof be despatched to all the towns, departments, and parishes of this jurisdiction.—Given in the palace of the supreme government in Assumption, capital of the republic of Paraguay, this thirteenth day of January, one thousand eight hundred and forty-two.

Letter dated Buenos Ayres, 10th February, 1841, from Mr. Hughes.

SIR,

In the month of June last year, I made an application to her Britannic Majesty's government, setting forth my desire to visit the province of Paraguay, asking for a recommendatory letter, and a special passport to that effect. I am now in possession of an official despatch, addressed by Lord Palmerston to his Excellency Don Gaspar De Francia, Dictator of Paraguay, requesting, in the name of the British government, my admission into that territory, and soliciting his excellency's good offices in my favour.

Before I take any further steps in the undertaking, it appears to me convenient and requisite to acquaint the government of the Argentine Confederation with my object, and to endeavour to obtain its sanction to the enterprise.

To this end I venture to trespass upon the attention of your excellency, and beg to be permitted to detail my views, and the means which I propose to employ in their attainment.

I purpose to purchase a suitable vessel, and to fit her out in the port of Buenos Ayres, under the British flag, putting on board a general cargo of such articles as are likely to suit the wants of Paraguay; and when ready, to proceed up the River Parana, direct to the port of Neémbucú, there to deliver my papers to the authorities, and to await the decision of the government to my application for the admission of my vessel and cargo.

*Assumption, Capital of the Republic of Paraguay,
18th January, 1842.*

We send unto you a passport, duly signed and sealed, returning that which was presented unto us, issued in your favour by the minister secretary of state for foreign affairs of her Britannic Majesty.

We also send unto you three official communications, addressed, the first unto the most excellent minister secretary of state in the department of foreign affairs to her Britannic Majesty, in reply to the official note which his excellency directed through your hands unto our predecessor the deceased dictator; the second unto his excellency the minister plenipotentiary of her Britannic Majesty in Buenos Ayres, requesting his excellency to send forward by the earliest opportunity the above-mentioned despatch to

the foreign office ; and the last to his honour the consul-general of her Britannic Majesty in Monte Video.

With this opportunity we repeat unto you the surety which we verbally gave unto you for your mercantile operations in the port of the Villa del Pilar (Neémbecú) and of Itapúa, appointed for trade by the sovereign congress of this republic.

We trust you will not forget our especial charge, to signify to his excellency the minister plenipotentiary of her Britannic Majesty in Buenos Ayres, the high appreciation with which we have received the felicitation of his excellency, assuring him of our desire to preserve a pure friendship with her Britannic Majesty and all her people.

God preserve you many years.

CARLOS ANTONIO LOPEZ,
MARIANO ROQUE ALONZO.

To Richard B. Hughes, subject of her Britannic Majesty.

The Consuls of the Republic of Paraguay.—Inasmuch as the British subject, Richard B. Hughes, returns to Buenos Ayres conveying official communications to the most excellent minister secretary of state to her Britannic Majesty in the department of foreign affairs, and to his excellency the minister plenipotentiary of her Britannic Majesty in Buenos Ayres, and to his honour the consul-general of her Britannic Majesty in Monte Video.

We hereby command and enjoin all the civil and military authorities of our dependancy, with earnest request and charge to those of other jurisdictions, not to oppose any impediment to him on his journey, without just cause, but rather to afford him all the assistance he may require. To which effect we have issued the present passport, duly signed and sealed in Assumption, capital of the republic of Paraguay, this eighteenth day of January, one thousand eight hundred and forty-two.

(Signed as above.)

The Buenos Ayrean government having refused to allow Mr. Hughes to send a vessel up the Parana for his property, in the following terms in a reply given by Senor Arana to Mr. Mandeville's request :—

“That Mr. Hughes's application could not be listened to—no permissions were granted to go beyond the limits of the province of Buenos Ayres. That the government would not give a licence for Entre Rios, and certainly not for Paraguay. That if he had taken up a larger amount of goods than he could bring returns, for it was no ground whatever upon which he could make a claim for a further licence.”

Mr. Mandeville considered Mr. Arana's answer as final and conclusive. Its injustice cannot be too severely condemned.

BOOK VIII.

HAYTI, AND FOREIGN WEST INDIES.

CHAPTER I.

COLONIAL POLICY OF FRANCE.

BURKE, in his account of the European settlements in America, extols the colonial policy of France, under the ancient *régime*, as constituting in system and in practice the perfection of administrative wisdom.

Whoever will examine the history of Canada, under France, and of the French West Indies, will discover that Burke was dazzled by the great value of the tropical products which were cultivated in the French possessions in the West Indies, and not by a full knowledge of the French administration, in those colonies. If the French colonial system had, according to its theory, been administered justly in the colonies, France would at this day have possessed Hayti: naturally one of the most fertile and splendid islands of America.

The French colonial system was, certainly, so constituted that it might well allure even Mr. Burke, and others, who only read of its organisation, into an admiration of its theory, and, into a belief that it was perfectly adapted for the wise and practical administration of the colonial governments.

We have examined the French colonial system, beyond France,—we have investigated its executive, legislative, and judicial administration in the Canadas, in Cape Breton, in the French West Indian islands, and in Guayana, and we have, especially in Hayti, found, it to be, in practice, a fallacious commercial and fiscal policy, partial and unjust in its administration, and very far from being divested of judicial corruption.

The French colonies were placed under the superintendence of a council of commerce in Paris; presumed to be judiciously constituted; its members being twelve chief officers of the crown. This council was assisted by deputies, presumed, also, to be chosen from the richest and most intelligent merchants and traders in the commercial towns of France. These deputies were liberally paid, for their attendance in Paris, from the funds of the cities in which they were chosen. This council sat once a week. Their duties were, to propose measures for redressing all commercial grievances,—for rendering prosperous declining,—

and reviving extinct trades,—for creating new branches of commerce,—for promoting manufactures already existing, for inventing and fostering new fabrics, to find out new markets for the products of French industry,—and, in general, to watch over all the commercial affairs of France, of the French colonies, and of foreign trade. The French plantations were placed under the especial care of this council. Its decrees, when drawn up, were reported to the royal council; which, almost without exception, issued a royal edict to enforce the decisions of the council of commerce.

This system was eminently French; that is to say, it was a system of centralisation, by which every thing was to be done by the paid council of commerce; nothing by the shipowners, merchants, manufacturers, or colonists, excepting by the dictation of this centralised absolute council of commerce.

In each colony there was a governor, who was the representative of the king, or rather of the council of commerce,—an executive (not legislative) royal council,—the members of which were selected by the crown (or by the council of commerce),—an *intendant*, who was a check against the governor, and also trustee of the king's rights and revenues. The council was presumed to be a check upon both governor and intendant, in order to protect the people. This system of appointing one authority over the other was, in principle, much in the same spirit as the colonial system of Spain; with the exception of the latter being delegated to more powerful authorities: that is, independent powers being vested in the three separate authorities of the viceroy, the church, and the *audiencia real*.

All salaries were paid by the crown; all the navigation and trade of the colonies were confined to France. There were few taxes, and no import duties, levied in the colonies; the duties on exports were only about two per cent *ad valorem* on the export from the colonies, and import into France. The amount of the salaries of the governors and all other officers,—the expenses of erecting fortifications and all other public edifices and buildings, were drawn by the intendant-general on the French treasury at Paris.* The expenses of the French colonies, including their garrisons and defences, imposed an enormous tax upon the French taxpayers at home, and tended, in a great degree, to cause those fiscal difficulties which finally involved the nation in its first sanguinary revolution.

The French colonial policy, instead of being the perfection of wisdom, as eulogised by Mr. Burke, was one maintained at an enormous expense, and with little advantage to France. The exclusive colonial trading system was of no real benefit to France. It was rendered abortive by the intrepid and fearless British-American, and West Indian smugglers; and by the connivance of the officers of the French government in the colonies. Notwithstanding the presumed intelligence of the council of commerce, its decrees were often at variance with facts,

* See an account of the enormous losses which followed the non-payment of the bills of the intendant in Canada—Article *Canada*, Book II.

and obstructive to practical undertakings in the plantations. The governors, intendants, and colonial councils, instead of the one checking the other, each found its interests best promoted by overlooking or tacitly approving their separate mal-practices.

It was argued in favour of the French colonial system, that the fisheries* of Newfoundland and Cape Breton flourished, and that the sugar plantations in the West Indies had thriven even more prosperously than those of England, and infinitely more so than those of Spain. We admit the fact; but if we examine the causes, these were, first, that the fishermen and sugar planters of France, aided in no way towards the colonial expenditure and defences; secondly, that the French fishermen, as they are still found to be in the ports of Boulogne, Dieppe, and Brittany, were always hardy, industrious, and economical seamen and fish-takers; and, lastly, that the French sugar-planters were generally intelligent, and economical until they became rich. But that the colonial policy was the most injudicious and expensive that could have been conceived with regard to the people of France; and, almost the worst that could have been planned for the retention of the colonies, is amply proved by facts, and especially by the history of Hayti, at one time the most prosperous of all the French possessions.

CHAPTER II.

HAYTI, OR SAN DOMINGO.

WE have in the first book of this volume briefly sketched an account of this magnificent and naturally fertile island, from the period of its first settlement by Columbus, to the occupation and colonisation of about one-third of it by France. The Spaniards had gradually neglected Hayti, after robbing the aborigines of their wealth, and destroying them by forced labour and sanguinary cruelties. It is true that a few, of the least adventurous but most industrious, Spaniards remained at Hayti, and cultivated sugar, ginger, and cacao; but, with the exception of the archiepiscopal establishment in the city of St. Domingo, the island was to a great degree abandoned by emigrations to Cuba, and especially to Mexico.

When the French colonised the western parts of the island, they even extended advantages to the Spanish farms and planters, by purchasing their cattle and horses; and, by breaking through the Spanish colonial system, they supplied the Spaniards in Hayti with manufactured goods at cheaper rates, and in greater abundance, than they could be obtained from Spain.

The cultivation of sugar, cacao, and ginger, was in consequence revived, and

* See Fisheries of America, Vol. II.

the culture of indigo, and tobacco was extended on the Spanish plantations. The great portion of the Spanish division remained, however, uncultivated, though it yielded the benefit of grazing cattle.

Hayti is estimated at nearly 400 miles long and from 60 to 150 broad. Its area is about 29,000 square miles, or 18,816,000 square acres. Near its centre rise the Cibao mountains, the highest of which are estimated at nearly 9000 feet above the sea; lower ranges ramify from these chiefly from east to west. On the east highlands rise among extensive plains, in parts without trees. These places afford good pastures: the Llanos, especially along the southern coast, which extend about eighty miles from the town of St. Domingo to Higüey, being about thirty miles in breadth. The Llanos are separated by a range of hills from the plain of La Vega on the north, extending east to west about fifty miles, and for about thirty miles in breadth. This plain is very fertile, watered by the Yuna down to the Bay of Samana. The low and swampy peninsula of Samana, on the north side of this bay, is joined to the mainland by a low isthmus covered by the sea at spring tides. Along the northern shores west of Samana, the mountains rise abruptly from the sea to a considerable elevation, with here and there a few slopes, long the shore, of lower lands. Behind these the wide and fertile plain or valley of Santiago is drained by the River Yague. Along the southern and northern shores of the western part of Hayti, small tracts of level and cultivable land occur only in detached portions, but between the hilly ridges are the valleys, or rather plains of Artibonite and Cul de Sac; the one is irrigated by the Artibonite the other covered partly by the salt lake Laguna de Henriquillo, and has no outlet, and by the fresh-water lake Saumache. The region between the mountains of Cibao and the southern coast comprises high hills and ravines, with but few inhabitants. The soil of the plains and valleys yields the most luxuriant vegetation, and the forest trees of the mountains are of gigantic growth. The most valuable trees are mahogany, lignum vitæ, ironwood, and dyewoods. Wild fowl, turtle, and excellent fish are abundant on the coast.

The coast in most parts is rocky, with numerous harbours for coasting vessels, some of which are capacious, with deep water. Port St. Nicholas, is about six miles long, and sheltered by mountains of considerable height. The harbour of Cape François, on the north coast of the island, is spacious, has good anchorage, but not thoroughly sheltered. The Bay of Samana affords good anchorage, but it is not frequented, being unhealthy. The harbour of San Domingo is exposed to the southerly winds—it has good holding ground. Port-au-Prince has two harbours, formed by islets; both afford good and sheltered anchorage. Gonaïves is a safe harbour, with water sufficiently deep for large vessels. The whole island is divided into six *departments* and thirty-three *arrondissements*.

PORT-AU-PRINCE, the capital of Hayti, is situated in the Bay of Gonaïves. The streets are straight, and tolerably wide and commodious, but the houses in

general are mean. Its trade is chiefly with the United States and Jamaica; population about 30,000. The town of Cape Haitien, on the northern coast, has about 12,000 inhabitants, with some trade. San Domingo, formerly the Spanish capital, has about 15,000 inhabitants. Its former trade in jerked beef, cattle, and hides, has nearly vanished.

Population.—The number of inhabitants is variously estimated at from 600,000 and 1,000,000, being chiefly mulattoes or quadroons; we doubt if the whole population exceeds 700,000. The number of whites and pure negroes is small in comparison with the mulattoes, or descendants of Europeans and negroes, and of the descendants of aborigines, Europeans, or negroes.

From the variety of climate all the tropical as well as the products of the temperate climates will grow in perfection. In the plains, of the old Spanish part, the heat is nearly uniform, and varies in proportion to their distance from the mountains. In the plains the thermometer is sometimes at 99 deg. In the mountains it rarely rises above 72 deg. or 77 deg. There the nights are cool enough to render a warm blanket or covering necessary; and in the higher mountains even a fire is agreeable in the evenings. Violent heats and heavy rains render St. Domingo humid. Metals soon tarnish, particularly on the seashore, which is more unhealthy than the interior parts of the island. The south part of the island is subject to southern gales, so called, as not attended with such dreadful consequences as the hurricanes in the Windward Islands.

Roads.—These are little more than foot-paths, or tracks passable on horseback. The island is in general watered by rivers and brooks. Their courses are but short, and few of them navigable to any distance. The rivers which in dry weather hardly cover the pebbles on its bed, is changed by a tempestuous rain into a flood; and should the banks give way, the rivers spread in devastation over the plains. Many rivers are infested with alligators. The only lakes or ponds worth notice are those of Henriquelle and Saltpond.

French and Spanish Boundary.—Before the independence of the island its divisions and statistics, chiefly on the authority of French officers' reports, and on the documents prepared by Bryant Edwards, were as follows:—The division line which separated the French from the Spanish part of the island extended from the River Des Anses à Pitre or Pedernales on the south side, to that of Massacre on the north side, at the head of the Bay of Mancenille. It comprised about 6,000,000 acres of a generally fertile soil, with hills, valleys, woods, and streams.

Spanish Division.—The cantons or jurisdictions, beginning at the westernmost point of the old Spanish frontiers, on the south coast or narrows, were Baharucu, then possessed by fugitive Spanish and French negroes; Neyve, Azua, Bani or Vani, the city of St. Domingo, and territory dependent thereon, St.

Laurent des Mines, Samana, Cotuy, La Vega, St. Yago, Daxabon, St. Raphael, Hinche, Banique, and St. John of Maguana.

Population of this Division.—It was composed of whites, freed people, and slaves. There were also a few Creoles resembling the Indians, having long, straight, and black hair, and seemed to be a mixed race descended from the aborigines and the Spaniards.

The people of colour were excluded from almost all employments, civil as well as military, as long as the colour of their skin betrayed their origin; but the political constitution of the country admitted of no distinction *between the civil rights* of a white inhabitant and those of a free coloured person. The major part of the Spanish colonists were then of a mixed race: which in a great degree quashed the prejudice otherwise manifested. People of colour were, however, admitted to holy orders, as *curates*, but not to the upper dignities of priests and bishops. The slaves were said to be treated with extreme mildness, and usually fed as well as their masters. Few of the creoles could either read or write. Slavery had so rapidly diminished that when in 1798, there were over the whole Spanish part of the island, 125,000 inhabitants; of whom 110,000 were free, and 15,000 only slaves. The French portion of Hayti furnished three-fifths of the produce of all the French West India colonies put together, or more than ten millions sterling. At that period the dress and mode of living of the Spanish creoles indicated pride, laziness, and poverty. The capital had the aspect of neglect and decay; insignificant towns were seen here and there, near immense districts, called *hattes*, where cattle were raised with little care. The *hattes* comprised most of the Spanish settlements; and were of an extent far disproportioned to their utility. Some were several square leagues in extent, with not above 500 head of cattle, great and small. Some were called *horse-hattes*, others *cattle-hattes*, according to the animals they reared; others for breeding pigs were called *corails*. In these *hattes* the people lodged and lived miserably. The small provision farms called *canacos*, were under the poorer colonists, or freed people of colour.

When the insurrection broke out in the French part of Hayti, the slaves in the Spanish part adhered with wonderful fidelity to their masters. They did not revolt nor attempt to enrich themselves by plunder, rapine, or predatory robbery. The attachment of the slave towards his master, arose from the Spaniards in Hayti being eminently the most kind and indulgent slave-owners. They seldom inflicted punishment, except for flagrant acts of insubordination and theft; and treated their slaves, generally, with leniency and humanity; attended to their wants, and so far mitigated the bond of slavery as to be such little more than in name.

A jealousy and hatred had always existed between the French and Spanish colonies in Hayti, yet the smuggling trade was carried on with the Spaniards for horned cattle, mules, horses, &c.; the French supplied them with the manufac-

tures of Europe, and with slaves : both which they could not obtain by the regular course of importation at such moderate prices as from the French. The latter purchased, annually, about 25,000 head of horned cattle, and about 2500 mules and horses ; the Spaniards also paid the French upwards of half a million of dollars, in specie, during the year for the purchase of goods, implements of agriculture, and negroes. Mahogany and dye-woods were legally exported to Spain, and clandestinely, to different parts of Europe, and to the United States, and, indirectly, to England. A trading intercourse of some extent, was carried on with the islands of Porto Rico, Cuba, and Jamaica : to both the latter islands cattle were exported, and mahogany and dye-woods, especially to Jamaica, more advantageously than to Europe, owing to procuring returns in a more direct and cheap way, than through Spain, or France.

The commerce with Porto Rico, and the Spanish main, was also productive of some profit to the people of Hayti, from the facilities of smuggling, by which the enormous duties on foreign European goods of thirty-four per cent, when imported from Spain, were in most cases saved ; such goods were purchased in Hayti on far more moderate terms, being illicitly obtained from the French part of the island.

The trade to the United States of North America, was also of importance ; North American vessels carried off large quantities of mahogany, hides, some coffee, and a little dye-wood, in return for flour, beef, pork, butter, salted herrings, and dried cod-fish : also some East India goods, and fir-timber, boards, and shingles.

CHAPTER III.

SKETCH OF THE REVOLUTION AND INDEPENDENCE OF HAYTI.

It was propagated, at the time, in England, with considerable industry, that the revolution of Hayti began on the breaking out of the French revolution,—with a revolt of the slaves. This was not the fact ; the slaves remained perfectly faithful to their owners, for about two years after the “ declaration of rights ” was promulgated in France.

The first symptom of revolt arose among the *Sans-mêlées* or *Gens de Couleur*, that is mulattoes, and other coloured free people, who had so far increased in numbers as to form a very powerful body. Not being admitted to associate with, or to participate in the civil rights of, the whites, they became naturally and inveterately, opposed to the latter. Many of the native coloured people of the other French islands, were living in France at the time of the revolution. They

had been sent there in early life for their education : others were living in France who possessed considerable property, and sufficient intelligence to seize on that opportunity to effect changes in Hayti. A society was established at Paris about the same time, called, "*Amis des Noirs*" (Friends of the Blacks), which called for an immediate abolition of the slave-trade, as well as a general emancipation of all those who were at that time living in a state of slavery.

"With these people" (meaning the men of colour in France), says a French writer on this subject, "the society of *Amis des Noirs* formed an intimate connexion. Their personal appearance excited pity, and, co-operating with the spirit of the times and the representations of those who deeply sympathised upon principles of humanity with their condition, all ranks of people became clamorous against the white colonists, and their total annihilation was threatened."

When the national assembly promulgated their famous declaration, "*that all men are born and continue free and equal as to their rights,*" the society of *Amis des Noirs*, aided by a society in London, and by the whole of the coloured people in France, lost no time in sending this declaration to Hayti, where the mulattoes, believed that the *French nation* was favourable to a restitution of their rights, and the full and unqualified enjoyment of all civil privileges. Several of the colonial civil officers and magistrates declaimed against slavery, and openly adopted the declaration of the national assembly of France; they were arrested by the provincial assemblies, which were composed of whites, and committed to prison, and such was the fury of the white mob, that M. Beau-dierre, a respectable magistrate at Petit Goane, was taken by force, and, in defiance of the civil powers, executed. During these and numerous other outrages, the negro slaves remained tranquil.

The governor of the colony had lost his popularity, with the whites, by his interposition in favour of the free coloured people. A general colonial assembly was convoked in January, 1790, by order from the king : which assembly decided that his instructions were imperfect and inapplicable, and that they should therefore proceed on a plan of their own. This confused state of the colonists, caused an apprehension, in France, that Hayti was likely to declare its independence, and the national assembly, in March, 1790, decided "That it never was the intention of the assembly to comprehend the interior government of the colonies in the constitution which they had framed for the mother country, or to subject them to laws, which were incompatible with their local establishments; they therefore authorised the inhabitants of each colony to signify, to the national assembly, their sentiments and wishes, concerning the plan of interior legislation and commercial arrangement, which would be most conducive to their prosperity." Then followed a resolution, "That the national assembly would not cause any innovation to be made, directly or indirectly, in any system of commerce, in which the colonies were already concerned."

The people of colour and the *Amis des Noirs*, were naturally alarmed by the

promulgation of so ambiguous a decree. Surprise and consternation attended its appearance in Hayti. It was construed into a further continuance of the slave-trade. It was considered by the colonists as conceding to them the power of settling their colonial constitutions, and absolving them from their allegiance to the crown of France.

A general assembly was convoked, after the decree had been received, and was held at St. Marc on the 16th of April, 1790. Its deliberations commenced, with a discussion upon the severity to which the people of colour were subjected under the military system of the colony; and it was decided, that they should not be required to perform more duty than was exacted from the whites.

M. Paynier, who was at this time governor-general of Hayti, had not that capacity of mind, nor the power of judgment and decision required for administering the affairs of a great colony in difficulties. Colonel Mauduit, a man of some ability and energy, arrived, and acquired such influence over the governor-general as to prevent a coalition which was about to take place between the assembly and the mulattoes. He declared himself the protector of the latter, and gained over the greater part of them. The planters were undecided—they wavered in their opinions—and were unfit to adopt measures for the tranquillity of the colony. It was evident that there was not one of them capable of energy and decision. They constituted a numerous class, without unanimous opinions or views. The decree of the general colonial assembly of the 28th of May was at least premature.*

On its promulgation it was believed, generally, that the “declaring of the colony an independent state, in imitation of the English American provinces,” was certain. No obedience, however, to the general assembly could be enforced. The white inhabitants of Cape François set the example of withdrawing all respect for that assembly, and of calling upon the governor-general

* The articles of the decree assume it as a branch of the prerogative of the crown to confirm or annul the acts of the colonial legislature at pleasure.

“First. The legislative authority, in every thing which relates to the internal concerns of the colony (*régime intérieur*), is vested in the assembly of his representatives, which shall be called ‘The General Assembly of the French Part of St. Domingo.’

“Secondly. No act of the legislative body, in what relates to the internal concerns of the colony, shall be considered as a *law definitive*, unless it may be made by the representatives of the *French part of St. Domingo*, freely and legally chosen, and confirmed by the king.

“Sixthly. As every law ought to be founded on the consent of those who are to be bound by it, the French part of St. Domingo shall be allowed to propose regulations concerning commercial arrangements, and the system of mutual connexion (*rappports commerciaux, et autres rappports communs*), and the decrees which the national assembly shall make in all such cases, *shall not be enforced in the colony, until the general assembly shall have consented thereto.*

“Eightly. Provided also, that every legislative act of the general assembly executed provisionally, in cases of urgent necessity, shall be transmitted forthwith for the royal sanction. And if the king shall refuse his consent to any such act, its execution shall be suspended as soon as the king’s refusal be legally notified to the general assembly.

“Ninthly. A new general assembly shall be chosen every two years, and none of the members who have served in the former assembly shall be eligible in the new one.

“Tenthly. The general assembly decree that the preceding articles, as forming part of the constitution of the French colony in St. Domingo, shall be immediately transmitted to France for the acceptance of the national assembly and the king. ‘They shall likewise be transmitted to all the parishes and districts of the colony, and be notified to the governor-general.’

to dissolve them. He instantly complied, and charged the general assembly with a design of overturning the peace of the colony, by projects of independency contrary to the wish of the colonists. He accused them with having been instigators of the mutiny of the crew of one of the ships of war, and pronouncing them traitors to their king and country, he declared that he should take the most prompt and effective measures, for bringing them to punishment.

An order was then issued to arrest the committee of the western provincial assembly. Colonel Mauduit, with a military force, failed in effecting this unwise design; the members hearing of his approach, collected about 400 of the national guard for their defence, and M. Mauduit retreated after a skirmish.

The general assembly immediately summoned the people to support and protect their representatives. The northern provincial assembly adhered to the governor-general, and sent him all the troops stationed in that quarter, together with an additional force of about 200 mulattoes. The western assembly collected a much greater force, and a sanguinary civil war seemed inevitable.

The general assembly of the island determined on an extraordinary, yet loyal though hazardous alternative. They resolved to proceed on a voyage to France, in order to appeal personally to the national assembly. About 100 members embarked on board the royal frigate *Leopard*: a ship, the crew of which had declared themselves in their interest. They sailed on the 8th of August, with the warmest acclamations of the populace, in admiration of so extraordinary an act of devotion to their country.

It was some time after the departure of the members of the general assembly, that the first mulatto revolt occurred. It was headed by Ogé, a young man about thirty years of age, and a native of the northern part of St. Domingo. He is said to have been a protégé of La Fayette and Robespierre. He had been educated in France at the expense of his mother, a woman of property living near Cape François. Having associated with the *Amis des Noirs*, he became enthusiastic in demanding equality of rights and privileges for his coloured fellow subjects. Stimulated by the *Amis des Noirs*, and by the revolutionary leaders, he left France for Hayti, in order to animate the men of colour to take up arms and to demand for them equal civil liberties and rights. To give him the *prestige* of military authority, the society purchased for him the rank of lieutenant-colonel in the military service of some German state. To conceal his object, he made a circuitous voyage by North America; but his purpose was discovered before he left France. The governor-general of St. Domingo was instructed to arrest him on his arrival, but he managed to land secretly, and remained unknown, until the expiration of several weeks, when he wrote to the governor, in the name of all the mulattoes, of which he called himself the protector, demanding the immediate execution of all the statutes of the *Code Noir*, and, that in all times to come there should be no distinction, as to rights and privileges, between the whites and the other inhabitants of St. Domingo. He even declared boldly

that unless the governor-general acceded to his propositions, he should assert them by armed force. Ogé miscalculated the support and aid to be received in Hayti, for the carrying his threat, or purpose, into effect. His brothers were animated by the spirit of revolt, and some others joined him, but Ogé never could collect at any one time, more than from 200 to 300 allies. He encamped with them near the Grand Rivière, and his brothers and another leader, named Chevane, are charged with having committed many excesses, and of murdering the unoffending inhabitants with the most horrible cruelty. Whole families were massacred, from the circumstance of a father, or even a brother, refusing to take up arms, to favour Ogé.

Troops, and the Cape militia, were despatched by the governor to suppress numbers so despicable. A skirmish ensued; many of the revolters fell, and some were taken prisoners. Ogé escaped, with Chevane, into the Spanish territory, where they were demanded, and received, by the new governor, M. Blanchelande. In March, 1791, they were tried and condemned: Ogé and Chevane to be broken on the wheel, and his brother and some of his followers, to be hanged. The intrepidity of Chevane never forsook him; he met his fate with the firmest courage. Ogé begged, in the most abject manner, that mercy might be extended to him. A respite was granted to him, in consideration of a promise, to make important discoveries, if his life were spared. Before commissioners appointed for that purpose, he made a detailed confession of the plan which the coloured people had devised to excite the slave population to rebellion.

In breach of all faith and honour, after this despicable, and deluded, man had made disclosures which informed the governor of the whole of their designs, the knowledge of which might have frustrated their progress, Ogé was, without delay, executed.

This base act of treachery on the part of the government, and its subsequent proceedings, excited the greatest hatred between the whites and the people of colour, the latter soon collected in large bodies. In the western and southern districts they formed encampments, with a determination to resist the decrees of the governor. At Jeremie, and at Aux Cayes, a most formidable body had assembled, well armed and accoutred. Mauduit, who commanded the government troops, was in secret conference with their leaders, and consulted personally with them, advising them not to desist from their purpose. By this treachery he discovered all their plans. The mulattoes were for the time dispersed.

The members of the colonial assembly, who had gone to France, having appeared at the bar of the national assembly, were dismissed with considerable disappointment and chagrin. The report of the committee appointed to examine their claims, concludes by stating, "That all the pretended decrees and acts of the said colonial assembly should be reversed and pronounced utterly null and

of no effect ; that the said assembly should be declared dissolved, and its members rendered ineligible and incapable of being delegated in future to the colonial assembly of St. Domingo ; that testimonies of approbation should be transmitted to the northern provincial assembly, to Colonel Mauduit and the regiment of Port-au-Prince, for resisting the proceedings at St. Marc's ; that the king should be requested to give orders for the forming a new colonial assembly on the principles of the national decree of the 8th of March, 1790, and instructions of the 28th of the same month ; finally, that the *ci-devant* members, then in France, should continue in a state of arrest, until the national assembly might find time to signify its further pleasure concerning them."

Nothing could exceed the disappointment which this decree excited throughout the colony, and the indignation of the people was general. To call another general colonial assembly was agreed to be impossible ; the people in many districts absolutely refused to return other representatives, declaring those who were under arrest in France to be the only legitimate members.

The national guards refused all further adherence to the cause in which they had enlisted. They were soon joined in the revolt by the regiment of which Colonel Mauduit was the commander. They tore the white cockade from their hats, and refused to obey him. He offered to restore the national colours, and appealed to them for protection against insult, which they promised him. On refusing to *beg pardon of the national guards on his knees*, he was, notwithstanding their pledge of protection, on the day appointed for restoring the colours, run through the body by the bayonets of his own regiment. The other regular troops present at this dastardly act, attempted to revenge themselves on the perpetrators, but were restrained in their intention : the revolted regiment, however, was compelled to lay down their arms, and were sent off prisoners to France.

When information of the execution of Ogé reached Paris, it excited great sensation on the part of the advocates of the people of colour, and of the society of *Amis des Noirs*. The Abbé Gregoire, with extraordinary eloquence, demanded the benefit which the instructions of March, 1790, gave to them. Robespierre, in an address of great eloquence, said, "Perish the colonies rather than sacrifice one *iota* of our principles ;"—and the national assembly confirmed the decree of the 15th of May, 1791, which enacted, "That the people of colour resident in the French colonies should be allowed the privileges of French citizens, and, among others, those of having votes in the choice of representatives, and of being eligible to seats both in the parochial and colonial assemblies."

This decree, on being received in the colony, excited the greatest indignation among the white people.

The governor, M. Blanchelande, had assured the provincial assembly of the north, "That he would suspend the execution of this obnoxious decree, whenever it should come to him properly authenticated ;" the coloured people, in

consequence, assembled in large bodies throughout the whole island, with the determination to enforce by arms the concession of the privileges to which, under the decree of the national assembly, they were entitled.

The first serious symptoms of revolt, it will now be observed, was not made by the slave population, but from the first interference of the national assembly of France, and afterwards by the supporters and advocates of the people of colour, and the society of *Amis des Noirs*.

It has astonished those who knew not the fact, that during the disturbances which had prevailed, the slave population should have remained passive observers of the contest. It may be at the same time remarked that the landed proprietors and planters were become wealthy; their extensive plantations with a rich and productive soil, and with a favourable climate, were in a high state of cultivation. Their manners and habits became depraved in about the same ratio as they advanced in prosperity. They are asserted to have been vain, haughty, and voluptuous, and, unlike their Spanish neighbours, they inflicted excessive punishments, in exacting labour from their slaves. Their sensualities, had also, it is affirmed, excited very general disgust.

Society had, in fact, become so depraved, that vice was gloried in. When the slaves were at length instigated to join in the revolt, it was not surprising that the untaught slave, should be led by pernicious example to indulge in iniquitous and immoral practices, and in the ungovernable propensities of his master. It was, in fact, the immorality of the master which prepared the slave for the extraordinary cruelties, which they afterwards inflicted in the spirit of revenge,—when instigated by the mulattoes, for enforcing their claims under the decree of the 15th of May, 1791.*

It has been generally asserted by the white population, that if the national assembly of France had not interfered with the system of governing the colony, which had been administered before the revolution, the slave population would have ever remained peaceable observers of events,—regardless of a bondage under which they had no physical wants, except their daily labour, to which they had always quietly submitted.

* In his "History of St. Domingo," Rainsford, who was a sojourner in the colony under circumstances of great danger, says of the planters: "Flushed with opulence and dissipation, the majority of the planters in St. Domingo had arrived at a state of sentiment the most vitiated, and manners equally depraved; while, injured by an example so contagious, the slaves had become more dissolute than those of any British island. If the master was proud, voluptuous, and crafty, the slave was equally vicious, and often riotous; the punishment of one was but the consequent of his own excesses, but that of the other was often cruel and unnatural. The proprietor would bear no rival in his parish, and would not bend even to the ordinances of justice. The creole slaves looked upon the newly-imported Africans with scorn, and sustained in turn that of the mulattoes, whose complexion was browner, while all were kept at a distance from an intercourse with the whites; nor did the boundaries of sex, it is painful to observe, keep their wonted distinction from the stern impulses which affect men. The European ladies too often participated in the austerity and arrogance of their male kindred, while the jet black beauty among slaves, though scarcely a native of the island, refused all commerce with those who could not boast the same distinction with herself."

The rising of the slaves in the revolution, it was contended, did not proceed from the oppression exercised by their proprietors;—but at the instigation of those who were striving for power in Hayti.

The whites claimed exclusive privileges. The people of colour naturally demanded the enjoyment of those social rights which the Abbé Gregoire and his colleagues in France advocated the concession of by the national assembly. There is much truth in these assertions; but we consider that it is chiefly to the imbecility and arrogance of the white planters that we must attribute the atrocities of the revolution in Hayti.

The first determined act of rebellion on the part of the slave population occurred near the Cape, in August, 1791, on the plantation of the Count de Noé. The chief leaders massacred the white inhabitants; the slaves demolished the sugar works and fired the dwellings.

They were soon aided by the slaves on other neighbouring estates; on which similar massacres were perpetrated. The whites were then indiscriminately slaughtered: except where some of the women were reserved for the brutal lusts of the most sanguinary and horrible ruffians. Some of the most delicate and beautiful of the female sex were brought forth to witness the butchery of their parents and relations; and they were afterwards subjected to the vile embraces of the executioner. Even girls of twelve and fourteen years were made the victims of lust and revenge. Such massacre and rapine, as those committed on the commencement of the rebellion in the north of Hayti, are almost unequalled in the annals of atrocity.

The resistance made by the militia and soldiers was not expected to suppress the revolutionists. It was a mere effort to enable the inhabitants of the city of Cape Haitian to defend themselves from destruction. The citizens and the national guards, with the seamen from the ships, were mustered and armed, in order to repel the rebels should they attempt to take the city.

There was a numerous force of free mulattoes in the city, whom the lower order of whites suspected of being in some way concerned in the revolt. These mulattoes were enrolled in the militia. In the northern districts, the white inhabitants assembled, and established two military posts at Grand Rivière and at Dondon. But the coloured people had greatly increased their forces by the desertion of the slaves from many estates,—and by a large accession of mulattoes. They attacked and captured the above two positions occupied by the whites; who were completely routed. The extensive northern plain, with all its surrounding mountains, abounding with every production for their sustenance, was soon after in possession of the revolutionists.

Nearly all white persons were subjected to horrible tortures: negroes and mulattoes seemed to rival each other in their atrocities.

It was apprehended that the mulattoes, who had joined the whites in the city, and had marched with them to the plains, would desert and join the revolters;

but the governor, before they were enrolled demanded, and received their wives and children, as hostages for their fidelity.

In this northern insurrection, it was estimated that more than 2000 of the white inhabitants, of all ages, were massacred. The demolition of the works and buildings of many plantations, and the total ruin of families were attendant calamities. The insurgents, meantime, being ignorant of the effects of artillery were often mown down in masses. Upwards, it is asserted, of 10,000 of them fell in the field, besides a very large number who were executed.

Whilst these atrocities were perpetrated in the northern district, the western district was menaced by a coloured force, which had mustered at Mirebalais, in order to capture Port-au-Prince and the whole plain of Cul de Sac. These insurgents, not exceeding 700 or 800, did not succeed further than burning the coffee plantations amid the mountains, and injuring the estates in the valleys. Some of the leading mulattoes finding it impossible to gain over the slaves, *en masse*, to their cause, proposed an adjustment. A planter, who had been highly esteemed by the people of colour, as well as by the negroes, through the whole Plain of Cul de Sac, interposed, and a treaty, called the *Concordat*, was concluded on the 11th of September, between the people of colour and the white inhabitants of Port-au-Prince.

This treaty stipulated an amnesty for past acts and differences, and the full recognition of the decree of the national assembly of the 15th of May. It was subsequently ratified by the general assembly of the colony; and, a proclamation was issued, in which it was held out that further concessions were contemplated for the purpose of cementing a good understanding between both classes. Mulattoes were voted eligible to hold commissions in the militia companies formed of persons of their own colour; and, some other privileges of minor consideration were conceded to them.

Immediately after the ratification of the *Concordat*, by the colonial assembly, had been announced, intelligence was received that the decree of the 15th of May of the national assembly in France, was, by that same assembly, repealed by a very large majority. This political and erroneous blunder was followed by the information, that the national assembly had determined on sending out commissioners to enforce the decree of the 24th of September, 1791; which annulled the decree of the 15th of May. It was naturally to be expected that the coloured people in the western and southern districts, were almost in immediate revolt against the government. In a few days they invested Port-au-Prince; but it had been strengthened by an additional force from France; and the insurgents were ultimately repelled with considerable loss; but not until a very large part of the city was burned down, or otherwise injured by the insurgents.

The slaves joined the mulattoes on the Plain of Cul de Sac. Plunder, freedom, and the gratification of sensuality, were the allurements held out to the slaves,

by the free coloured insurgents. Sanguinary actions were fought, attended with horrible cruelties to the prisoners taken on both sides.

The commissioners of the national assembly arrived in September from France. They proclaimed a general amnesty and pardon to all who should desist from acts of insubordination, and who would subscribe to the new constitution. This proposition was disapproved by the colonial assembly and by all parties. The commissioners then left the island in which they found themselves powerless and disrespected.

The society of *Amis des Noirs*, had soon after attained considerable influence in the national assembly; in which there appeared an union in favour of the mulattoes, and also of the slave population. This national assembly passed another decree on the 4th of April, 1792, which abrogated that of the 24th of September, 1791. This constituted the first advance towards emancipating the slaves, although it does not openly declare the same.*

The carrying of this decree into effect was intrusted to three commissioners, who, with a force of 8000 men, arrived in Hayti on the 13th of September following. They immediately dissolved the colonial assembly, and sent the governor Blanchelande, to France; where he was tried and guillotined. M. Desparbes, his successor, having disagreed with the commissioners, was suspended, and sent to France, where he was, it is said, also guillotined.

It was asserted by the whole inhabitants, that the commissioners of the national assembly, while professing to the white inhabitants, their earnest solicitude for the preservation of peace, and the prosperity of the colony, were secretly intriguing with the mulattoes; and they in the end, openly declared that the latter, with the free negroes, should enjoy their civil privileges, and the protection of the 8000 national guards which had arrived from France.

* By the decree of 1792, "The national assembly acknowledges and declares that the people of colour and free negroes in the colonies, ought to enjoy an equality of political rights with the whites; in consequence of which it decrees as follows:—

"Article 1. Immediately after the publication of the present decree, the inhabitants of each of the French colonies in the windward and leeward islands, shall proceed to the re-election of colonial and parochial assemblies in the same month.

"2. The people of colour and free negroes shall be admitted to vote in all the primary and electoral assemblies, and shall be eligible to the legislature and all places of trust, provided they possess the qualifications prescribed.

"3. Three civil commissioners shall be named for the colony of St. Domingo, and four for the Islands of Martinique, Guadeloupe, St. Lucia, and Tobago, to see this decree enforced.

"7. The national assembly authorises the civil commissioners, to call forth the public force whenever they may think it necessary, either for their own protection, or for the execution of such orders as they may issue by virtue of the preceding articles.

"8. The executive power is directed to send a sufficient force to the colonies, to be composed chiefly of national guards.

"9. The colonial assemblies immediately after their formation shall signify, in the name of each colony respectively, their sentiments respecting that constitution, those laws, and the administration of them.

"10. The colonial assemblies are authorised to send home delegates, for the purposes mentioned in the preceding article.

"11. Former decrees, respecting the colonies, shall be in force in every thing not contrary to the present decree."

A new governor, M. Galbaud, arrived in May, 1793, to take the command, and to place the island in a state of defence, in case the British might invade it: war having been declared between the two powers. The national assembly of France soon after sent out commissioners with fresh instructions, and suspended the new governor. They decreed that any person holding property in the colonies should be ineligible to fill any office of trust in the colony in which his estate was situated.

Galbaud, aided by his brother, armed a force composed of militia, seamen from the ships in the harbour of Cape Haytien, and a great number of volunteers, and marched without delay against the commissioners, who were with the regular troops. A bloody conflict ensued, and the battle was continued with obstinate bravery, until the sailors, who composed the greatest strength of Galbaud's force, became disorderly. He was consequently obliged to retreat.

Various skirmishes followed. Galbaud's brother fell into the hands of the commissioners, and the son of one of the commissioners was captured by Galbaud. The commissioners finding that their troops, were rapidly deserting, and that Galbaud's forces were resolute, and fought with unexampled bravery, they called to their aid the revolted slaves, offering them their freedom, and promising them the pillage of the city of Cape Haytien. Some of the rebel chiefs rejected this dishonorable proposition, but Macaya, a negro of brutal disposition, with an insatiable thirst for the blood of the whites, accepted the proposal of the commissioners, and with 3000 or 4000 of the negroes joined the commissioners. The city was attacked, and men, women, and children, were, without distinction, slaughtered. The mulattoes had now acquired the utmost power of gratifying their revenge; they even sacrificed their own white parents, and afterwards subjected their bodies to every species of insult and indignity. So atrocious were the excesses, that the commissioners of the national assembly repaired to the ships, from which they were spectators of the effects of their own crimes, and beheld an opulent city consumed by the flames, and the inhabitants subjected to the most atrocious massacre.

When the insurgents first entered the city, every man, woman, and child were bayoneted or cut down; except the young females, who were in most cases spared, for the gratification of the lust of those into whose hands they fell.

After these first atrocities, emigrations commenced from the colony to the United States, to the neighbouring islands, and of some of the opulent planters to England, under the impression that the British government would be disposed to turn its attention to their cause. The war between France and England having commenced, some regard was paid to their solicitations, and the government of England, sent directions to the governor of Jamaica to afford those inhabitants of St. Domingo, who were desirous to place themselves under British protection, every possible support, and to send, without delay, a competent force, to take possession of such places as the people might be disposed to surrender to them.

The intentions of the British government being known, by the means of secret agents, the commissioners of the national assembly "proclaimed the abolition of every species of slavery, declaring that the negroes were thenceforth to be considered as free citizens."

No sooner had the abolition of slavery been promulgated, than the slaves rose simultaneously in the different parishes; and, forming bands, they first took possession of the mountains, in order to secure themselves within the numerous fastnesses. They then sallied forth into the plains, and set fire to the cane-fields: demolishing every habitation within their range, and murdering the white inhabitants. In one part of Hayti, the insurgents amounted to nearly 100,000, without any resolute leader. In the north district they amounted at first to from about 20,000 to 25,000, but their number was soon increased to 40,000 of the most desperate negroes.

The British force, under Colonel Whitelocke, appeared at Jeremie on the 19th of September, 1793; it consisted of about 870 rank and file. This place was given up to the British by stipulation; it was taken possession of the next day; and all the inhabitants took the oath of allegiance to the King of England. Cape St. Nicolas next followed; but the inhabitants displayed some hostility, and most of them joined the republican standard. Tiburon was next attempted, but from the faithlessness of the planters, the British troops were obliged to retreat with some loss. Further operations were suspended until a force from England arrived in February following: consisting of a British squadron, with troops, which were immediately landed, commanded by Major Spencer. He gallantly attacked the enemy, and drove them back with considerable loss. The bight of Leogane was commanded by the British squadron, and skirmishes took place in the vicinity of Leogane, as well as at Tiburon, and in the neighbourhood of Cape Nicolas Mole. In some instances the British were successful; in others the enemy obtained advantages.

Andrew Rigaud, a man of colour, made his first appearance at this period at the head of the revolted slaves. He previously had the command at Aux Cayes, and, with about 2000 of the insurgents, besieged Tiburon; but the fort was manned by some British soldiers, who, with the people, sallied forth, attacked the besiegers in the field, and routed them with great slaughter.

On the 19th of May, the British force, long expected, arrived under the command of General Whyte. On the 30th, the ships of war, consisting of four ships of the line, three or four frigates, and several smaller vessels, anchored off Port-au-Prince. The land forces amounted to only about 1500 men, capable of doing duty. On the following morning, a summons to surrender the city was sent, to which no attention was paid. The commissioners were in the city with a considerable force. Fort Bizotton, which is situate on an eminence to the southward of the city, commands the Leogane road, and the southern entrance in the harbour. The land-side was attacked by a body of troops under Major Spencer,

a simultaneous attack was made on the sea-side by two of the ships of war. Captain Daniel, of the forty-first regiment, with about seventy or eighty men, during a thunder-storm, about eight o'clock, entered the breach and carried the fort. He was severely wounded, and some of his men and officers were killed. The city surrendered, the commissioners evacuated it on the 4th of June, and the British troops entered and took possession of it, and the shipping in the harbour.

The taking of Port-au-Prince was followed by sickness, which raged amongst the British troops to such an extent, that it was found necessary, for the preservation of the post, to erect additional lines of defence against the insurgents. The British troops were in consequence subjected to incessant toil in the sun, and during the night exposed to pestilential vapour fires. The commissioners carried about 200 mule-loads, or nearly all the riches of the city, and they were accompanied by about 2000 of the inhabitants. These commissioners had lost their power.

The value of the property taken at Port-au-Prince, was estimated by a writer of some authority as follows :—

“ In the harbour were found two-and-twenty top-sail vessels, fully laden with sugar, indigo, and coffee, of which thirteen were from 300 tons to 500 tons' burden, and the remaining nine from 150 tons to 300 tons, besides 7000 tons of shipping in ballast; the value of all which, at a moderate computation, could not be far short of 400,000*l.* sterling. One hundred and thirty-one pieces of cannon, regularly mounted in batteries, were on the lines.”

A reinforcement arrived soon after, under the command of Lieutenant-Colonel Lennox, consisting of about 600 men. On their passage from the windward islands to Jamaica sickness broke out, and more than 100 died on board, and 150 were left at Port-Royal in a hopeless state of disease.

General Whyte, the commander-in-chief in Hayti, was attacked by malignant fever; and his health was so much impaired that he was compelled to return to England in September, 1794: the command devolved on Brigadier-General Horneck.

General Williamson arrived in May, 1799. In the meantime the mulatto Rigaud, commanding a strong force, attacked and captured Leogane, which was defended by colonial troops. He murdered all the French planters who fell into his power, and then marched towards Port-au-Prince. He attacked Fort Bizoton which commanded his advance, and was repulsed with great loss, and with 3000 men retreated to Aux Cayes. With this force, and four small armed vessels, on the 25th of December, he commenced the attack. The fort, which consisted of no more than 450 men, defended it gallantly; and after the loss of two-thirds of their number, the remainder sallied forth, to attack Tiburon, cut their way through the insurgents, and succeeded in retreating to Irois.

At St. Marc, Colonel Brisbane, who commanded there, defeated the insurgents in several skirmishes on the plains of Artibonite; but, in his absence,

the mulatto inhabitants of St. Marc, who solemnly had pledged themselves to observe the strictest neutrality, violated their pledge, and murdered all who were opposed to the French republic. The garrison defended themselves in the fort until they were relieved by a vessel of war from Cape Nicolas Mole. The white inhabitants of St. Marc, conspired to destroy Colonel Brisbane and his force, but he discovered and defeated their plot.

At Port-au-Prince, a conspiracy was also discovered, the purport of which was, to massacre the garrison and all the English, by those very French inhabitants, who hailed with acclamations the arrival of the British force before the city. The conspirators were seized, and about twenty, amongst whom were several French officers of rank, were tried by a court-martial. Of these conspirators fifteen were shot on the 18th of February, 1795, and the remainder were sent off the island.

General Williamson, to augment his force, formed several corps of negroes, whom he purchased of the French planters, and placed them under the command of officers of the line. There was great absence of sound forecast and judgment in this act. They were both useless and disobedient. General Williamson was succeeded by General Forbes, who acted entirely on the defensive.

In 1795, the war between France and Spain terminated; and the despicable Godoy, Prince of Peace, ceded the Spanish part of the island, and its Spanish subjects, to their utter dismay, to the French republic in perpetuity.

Brigadier-general Howe arrived in the end of 1795, with about 7000 men, at Cape Nicolas Mole. This additional force did not enable the British troops to attempt much. Sickness and privations overwhelmed them. The insurgents meantime were increasing in numbers, and acquired vigour and activity.

In 1797, General Simcoe landed in Hayti, to take the command. About the same time the negro Toussaint l'Ouverture was invested by the republican government of France with the high rank of general-in-chief of the armies of St. Domingo. The negro general proved a tactician of no ordinary genius and courage. Discreet and intelligent, and well acquainted with the strength of the British force, and of the experience of their commanders, Toussaint remained apparently passive, further than appearing before Mirebalais with a more powerful force than had previously been collected. The British troops not being sufficient to oppose his progress, retreated through the plains of Cul de Sac to Port-au-Prince, abandoning the whole of the country through which they retreated, and from which, from its fertility, the enemy were enabled to obtain abundance of provisions. By this retreat, all communication with the Spanish part of the island was cut off.

To the southward, however, the negroes were driven from every post which they had occupied, and Rigaud, commanding the mulatto force, was defeated at Irois. Toussaint attacked St. Marc's, but retreated with considerable loss.

The British power in the island, however, declined, and no attempt was afterwards made to attack the insurgents. During these irregular skirmishes, General Simcoe left Hayti, and the command devolved on Major-general Whyte. Bri-

gadier-general Maitland succeeded in April, 1798, under circumstances of discomfiture, and distress. He terminated this most ill-judged and disastrous contest by a truce, and negotiations with Toussaint. The whole of the British conquest, and the colonial black troops, for whom an enormous sum of money was paid to the very persons who afterwards took arms against them, were ceded to the black general, Toussaint, in the name of the French republic, and thus ended, with the exception of the great amount which its expense has bequeathed to British national taxation, one of those expeditions which tarnish British wisdom.

Toussaint was born about the year 1745, on the plantation of the Count de Noé, not far from Cape François. Of his early life, his steady patience, his mildness to brute animals, and his inviolable fidelity and love to one female, whom he had chosen as his wife, were the most remarkable characteristics. The regularity of his life attracted the notice, and gained the confidence of M. Bayou de Libertas, manager of the plantation on which Toussaint was born. Through the kindness of this manager, or, as others affirm, by his own unaided application, he learned to read and write, and became a proficient in common arithmetic. These acquirements were scarcely ever attained by a slave in Hayti. M. Bayou brought him from field labour, and made him his postillion; a place in which he could gain some money, and find leisure to cultivate his mind. The extent of his reading in a few years was, with his ideas, expanded, and his powers of reasoning became remarkable. He was also further promoted by M. Bayou.

When the insurrection of 1791 broke out, Toussaint was solicited to act in concert with several of the leaders who were his friends. It is possible that gratitude to his benefactor, M. Bayou, prevented him from yielding to their solicitations. That he did not is certain. Among the whites who remained latest in St. Domingo was M. Bayou. His flight at last would have been impracticable, had not Toussaint managed it with some hazard to himself. He did more: he sent with him a quantity of colonial produce, sufficient for the supply of his future wants; and when M. Bayou settled at Baltimore, Toussaint seized upon every opportunity to make remittances.

After the departure of M. Bayou, there was nothing to prevent Toussaint from fighting under the standard of revolt, and he joined Biassou, one of the negro chiefs, as his second in command. It was not long before Biassou was degraded from an authority which he had atrociously abused, and Toussaint was elected chief. The death or degradation of the other chiefs, and the superior abilities of Toussaint, soon raised him to the rank of principal commander of the negro army.

On the evacuation of Hayti by the British forces, most of the planters, who had been faithful to their engagements, departed at the same time, taking with them such moveable property as they were enabled to carry to Jamaica, Cuba, and the United States. Toussaint l'Ouverture was then left in full possession of the island, and in the undisputed chief command. Peace succeeded.

CHAPTER IV.

REIGN OF TOUSSAINT.

TOUSSAINT was a most remarkable man. In features and colour he was a pure negro. His first great policy was directed to the culture of the soil, in which he made rapid and even astonishing progress. He adopted the maxim, that "agriculture is the main spring, the master sinew of every great state, the perennial fountain of wealth." In this policy he greatly resembled Francia the Dictator of Paraguay. The planters who had joined his standard were reinvested with their estates; and, without any property in their slaves, they were encouraged to cultivate their lands. He had heard, and believed "that rural or agricultural labours are equally conducive to health and strength of body and mind; that the culture of the earth constitutes the most natural and innocent employment of man; that it fills houses with plenty and hearts with gladness." But after six years' relaxation from the toils of the field, and of predatory warfare, those who had been accustomed to slavery, were not disposed to return to their original occupations, and he knew that the negro population would not readily be induced to labour, and that coercion, mild, if possible, would be necessary to enforce it. He directed that each person, not in any military capacity, should labour in the cultivation of the lands held not only by the government, but by such of the planters as had been repossessed in their estates.

The planters were compelled to employ them as servants; and the latter were ordered to choose the employers under whom they were to work, and on no consideration were they allowed to leave the estates on which they agreed to labour, unless their services were demanded in the army. He fixed wages for the labourers, to be computed equal to one-third of the value of the crops; other arrangements were made suitable to the views and mutual accommodation of parties. This absolute policy, enforced immediately after the cessation of civil war, proved both the influence held by Toussaint over them, and his conviction that the advancement of agriculture, required him at once to adopt rigid measures.

He promulgated an edict for enforcing the culture of the soil, which appeared in 1800, and it subsequently formed a leading part of the *Code Hatte*, or *Code Henry*, of Christophe. Mr. Franklin observes, that

"It embraced every object that could possibly be conceived likely to promote his great aim; and whilst its enactments might have the appearance of severity, unpalatable to the people just emerged from slavery, so great was his influence, that he felt no alarm for the consequences of enforcing them; and those who had the temerity to infringe them were visited with the whole weight of the penalties.

"This law apportions the hours of labour for the cultivator, which by the 22nd ar-

ticle appears in every point the same as that which is exacted from the slave in the British islands, that is to say, it commences at the break of day and concludes at night, allowing an interval of an hour for breakfast, and another of two hours at noon. It provides against any innovations, and precludes the labourer or the proprietor from the chance of imposing on each other. I see nothing ambiguous in it, it is clear in the letter, and the spirit of it cannot be erroneously interpreted. From the 113th to the 120th article inclusive, it appears beyond the possibility of contradiction, that Toussaint was conscious that nothing could be done in the work of the soil without such forcible regulations as would command the most strict attention to tillage.

"It is quite clear that the labour which this law exacted each day from the cultivator was not oppressive, nor have I been able to discover that the slaves in the British colonial possessions ever complained of the labour to which they were subjected, as having been too severe; and it is undeniable that Toussaint, under the very law which has been cited, compelled the same portion to be done, and that for the better insuring its performance, military guards were placed to superintend the labourers and to seize those who endeavoured to evade their duty. That they could not have been injured by labour, and that they did not murmur at its quantum is tolerably clear, for it is said by a writer of some repute, that 'the plantation negroes were in general contented, healthy, and happy; and that this was their condition I am assured by the concurring testimony of men who had witnessed their state at that period.

"There were no civil authorities by which the indolent or refractory cultivator was to be tried for his offences; there was no distinction between the vagrant who was detected in idleness and the soldier who fled from his post, they were both amenable to the military power, were sentenced by a court-martial, and awarded an equal punishment.

"Possessed of no mean capacity and judgment, he knew the character and the dispositions of his negro brethren, and so nicely did he discern and reward industry, and discriminate between the active and meritorious, and the indolent and the worthless, that, although in some cases his judgment was harsh, it was admitted to be just."

His plans were prepared with intelligence and skill, and the consequent rapid progress of agricultural improvement has astonished his greatest enemies.

Those who had emigrated during the revolution, were encouraged to return, by his assurance that he would protect, and reinstate them in their lands. Many returned and brought with them the slaves who had accompanied them in their flight; though the latter became free on landing. He endeavoured to improve the domestic morals, and to repress sensuality and voluptuousness, by recommending and encouraging marriage. Polygamy, which prevailed, checked the increase of population; and it soon became apparent that an increase of births resulted from his regulations.

The character of Toussaint is extolled as almost faultless by most writers, even by Bryant Edwards. Mr. Franklin, however, in his work on Hayti, says,—

"Whatever may be the prevailing opinion, he has left indelible marks behind him which prove that he was revengeful and sanguinary in the field: and the atrocities and cruelties which he exercised over those mulattoes who fell into his hands, are demonstrative of no little ferocity of disposition. It has been argued in exculpation, that surrounded as he was with people of that class who adhered to his cause, and who, he expected, might revolt and join the standard of his enemies, it was a matter of absolute expediency, that he should resort to the severest measures to deter them from deserting his standard, or from engaging in any enterprise inimical to his cause. But in all his actions he seemed to be actuated by a determination to exact the most rigid acquiescence in his will and a complete acknowledgment of his supreme power, and to establish which, true it is, he had at times recourse to very harsh and cruel measures."

Rainsford, a British officer, who knew Toussaint personally, says, that he had not those unrelenting feelings which have been ascribed to him. Rainsford was taken prisoner, and afterwards set at liberty by Toussaint; of his character and of his generalship in the field, he says,—

“Thus proceeded this illustrious man, like the simple acorn, first promiscuously scattered by the winds, in its slow but beauteous progress to the gigantic oak, spreading its foliage with august grandeur above the minor growth of the forest, defending the humble shrub, and braving the fury of the contending elements. When the cloud, charged with electric fluid, becomes too ponderous, it selects not the brooding murderer on the barren heath, but bursts perhaps indiscriminately in wasteful vengeance over the innocent flocks reposing in verdant fields. He was, without doubt, a man possessed of many virtues, and performed many very good and very generous acts, and, what must be admitted to have redounded greatly to his reputation, he was always grateful, and never left an obligation unrequited. To those planters whom he induced to return to the island, and whom he restored to their properties, he was generous, kind, and indulgent; and of the confidence which they placed in his assurances, they had never cause to repent. Taking him altogether, he was undoubtedly a most extraordinary character, and whatever might have been the extent of his vices, they were certainly counter-balanced and atoned for by many virtues.”

An anonymous writer says, that

“The excellences of his character unfolded themselves more and more, as opportunities were afforded for their development. The same humanity and benevolence which had adorned his humble life, continued to distinguish him in his elevation. He never imitated the conduct of other leaders, in flattering the multitude, encouraging them in crimes, or urging them to revenge and slaughter; on the contrary, mercy, industry, and order were always inculcated by his counsels, recommended by his example, and enforced by his authority. The fertility of his inventions, the correctness of his judgments, the celerity of his movements, the extent of his labours in the combined and multifarious business of war and government astonished both friends and foes. If there was one trait in his character more conspicuous than the rest, *it was his unsullied integrity*. That he never broke his word, was a proverbial expression common in the mouths of the white inhabitants of the island, and of the English officers, who were employed in hostilities against him.”

On peace being restored, Toussaint restored public worship according to the forms which existed prior to the revolution, and he extended full liberty to other forms of religious worship, allowing Methodists, who had arrived from the United States, protection, and the privilege of preaching.

He reduced his military establishment at the peace. The discipline of his troops was admired even by British officers.

Hayti, in most parts, was intersected with underwood and difficult mountain passes, and irregular bodies, detached in parties, were generally more effective in their operations than large masses of troops. Toussaint sought to drill his troops in such evolutions as would enable him effectually to meet the exigencies with which he might have to contend. It is said of his troops, that

“At a whistle a whole brigade would run 300 or 400 yards, then separating, throw themselves flat on the ground, changing to their backs or sides, keeping up a strong fire the whole of the time till they were recalled; then they would form again in an instant with their wonted regularity. This single manœuvre used to be executed with such facility and precision as totally to prevent cavalry from charging them in bushy and hilly countries.”

His military forces during peace consisted of about thirty thousand foot and two thousand cavalry, well equipped, and in complete readiness for active service.

In the framing of his constitution and laws, Toussaint was assisted by intelligent Americans and Europeans. No prejudices against the white race influenced him, when their services were useful. He exacted courteous attention from his subjects, to secure the aid of men of learning and ability, without reference to what may have been their country, profession, or religion. Among them were the Abbé Molière and M. Marin, and several English and Americans. He was liberal and friendly to them all. In the organisation of his municipal governments, and in the arrangements for the different departments of state; in forming regulations for a commercial intercourse with foreign countries, he was assisted by those intelligent and gifted men. Toussaint was convinced, that without foreign trade, his efforts in cultivating the soil would have been to a great degree unprofitable. Without a market for agricultural products, there would have been little stimulus to industry: as in so fertile a country a sufficient quantity of food for consumption required but little exertion. He made a tour through the Spanish part of the island, which inspired confidence in the people; and he was received by them with respect, and often with joy. His achievements, and mild and agreeable manners, rendered him highly popular. The Spanish division of the island though ceded to France by the treaty of 1795, was never thoroughly occupied by the French republican forces. The city of St. Domingo, surrounded with fortifications, held out until the arrival of Toussaint, in 1801, when the whole Spanish division surrendered to his forces.

In 1801 the whole island of Hayti was tranquil under the authority of Toussaint,—and then its prosperity, if undisturbed, appeared secure. The peace of Amiens suggested to Napoleon the recovery of St. Domingo. Instigated by the colonists who had fled to France; and considering that he could only rival the power of England, by the possession of colonies and commerce; urged also by speculators in France, and more so by his ambition, he resolved to subjugate Hayti by force. An expedition, consisting of twenty-six sail of the line, carrying 25,000 men, under the command of his brother-in-law, General Le Clerc, sailed for its conquest. Two of the sons of Toussaint were then in France, attending a course of scientific and legal studies. They were taken from their preceptor by the First Consul, and sent on board the fleet as hostages in the hands of the French general, in the event of any opposition by Toussaint to the landing of the French army.

The fleet arrived in the Bay of Sumana on the 25th of January, 1802. General Le Clerc distributed his force into four divisions. One division, commanded by General Kerseran, was directed to disembark and take possession of the city of St. Domingo; another, under General Boudet, was to invest Port-au-Prince;

a third was to proceed to the south side of Hayti, and land one section at Mansenillo Bay, under General Rochambeau. The main body, under Le Clerc, with his personal staff, intended to disembark at, and capture Cape François.

Toussaint was informed of the expedition leaving France, but knew nothing of its force, or the policy which organised its objects. He considered himself still under the suzerainty of the French republic; and even believed that this force might have been sent principally for assisting him in maintaining the peace of the island.

Le Clerc did not, however, even attempt negotiation with Toussaint. General Rochambeau, who landed near Fort Dauphin, drew up his troops on the beach, and the negroes, who believed that the French landed as friends, flew in crowds to witness the disembarkation, and to welcome their arrival. Rochambeau, without the slightest intimation, charged them at the point of the bayonet; many were slaughtered, and the rest fled with difficulty, leaving the fort in possession of the French. General Christophe, who commanded at Cape François, having immediately heard of the unaccountable and cowardly outrage at Fort Dauphin, soon prepared for defence.

By this wicked blunder, at Fort Dauphin, Le Clerc was prevented from taking Toussaint by surprise. Christophe, suspicious of the French from the first, disposed his forces judiciously: strengthening the weak points of assault, and animated his troops with confidence in their own strength. He acquainted the white inhabitants of the city, that their lives would be held by him as security for the hostile proceedings of the French, and that he would never surrender so long as a single house stood. The whites previously knew of the hostility of the French armament. They were secretly favourable to it; but they were fully sensible that the dreadful denunciation of Christophe would be executed. A deputation of the white inhabitants, headed by the municipal authorities, waited upon the French commander-in-chief, imploring him to refrain from hostilities, as it was the determination of Christophe to massacre them, and destroy the city, if it should be attacked by the French forces. Le Clerc told them that his orders were not to restore slavery, but to secure St. Domingo to the consular government of France.

The proclamation sent out by Bonaparte was to the same effect. The sequel will show that neither the First Consul nor his general ever intended what they stated. Never was more gross dissimulation practised.*

* Bonaparte proclaimed:—"Inhabitants of St. Domingo,—whatever your origin or your colour, you are all French: you are all free, and all equal before God and before the republic.

"France, like St. Domingo, has been a prey to factions, torn by civil commotions and by foreign wars. But all has changed, all nations have embraced the French, and have sworn to them peace and amity; the French people, too, have embraced each other, and have sworn to be all friends and brothers. Come also, embrace the French, and rejoice to see again your friends and brothers of Europe.

"The government sends you Captain-General Le Clerc; he brings with him numerous forces for protecting you against your enemies, and against the enemies of the republic. If it be said

Many accepted the offers, and joined the standard of Le Clerc. He then wrote to General Christophe, "that unless he immediately acceded to the landing of his forces, he will hold him (Christophe) responsible for what may happen."

Christophe, firm, bold, inflexible, and decided, replied, "that he would fearlessly resist the French forces, and that they should not enter Cape Town until it was reduced to ashes." "Nay," says he, "even in the ruins I will renew the combat." Again he says, "How can you hold me responsible for the event? you are not my chief. I know you not; and can therefore take no account of you, till you are acknowledged by Governor Toussaint."

Le Clerc landed his forces near Da Limbe and the Bay of Acul, west of the city. Christophe, knowing that the white inhabitants were wavering and faithless; that many mulattoes, and even negroes, were secretly inclined towards the French, promptly commenced the work of conflagration which he had threatened: and when Le Clerc and Admiral Villaret came within sight of the city, they perceived it in the course of rapid devastation. The French commanders made great efforts to save the town, but they were only able to save a few buildings.

Christophe's threat, to massacre the inhabitants, was not, ever to his credit, put in execution. He carried off many, whom he held as hostages for the conduct of the French; but it is not recorded, even by his enemies, that he treated them with any barbarity, or that he executed any of them. On destroying the town, he retreated with his forces to a strong position, until he was joined by the Governor-General Toussaint.

The latter soon arrived, and personally inspected every position by which it was practicable to make a successful stand against the enemy.

At the same time, on resorting to his seat at Ennery, about thirty miles from the Cape, his two sons were brought to him to try how far affection might enfeeble him, so as to forget his duty. The crafty, plausible tutor Coisson, the affectionate children, the fond father, and the tender mother—all failed; Toussaint was inflexible. A writer of the time, who describes the interview which took place, says:—"The two sons ran to meet their father, and he, with emotions too big for utterance, clasped them silently in his arms. Few, it is to be hoped, are the partakers of our common nature, who, on witnessing the embraces and tears of parental and filial sensibility, could have proceeded, at least without

to you, these forces are destined to ravish from you your liberty, answer, the republic will not suffer it to be taken from us.

"Rally round the captain-general; he brings you peace and plenty. Rally all of you around him. Whoever shall dare to separate himself from the captain-general will be a traitor to his country, and the indignation of the republic will devour him, as the fire devours your dried canes.

"Done at Paris, &c.

"(Signed) The First Consul, BONAPARTE."

powerful relentings of heart, to execute the commission, with which Coisson was charged."

This was the moment which Coisson thought most favourable to the perpetration of his treacherous design. "The father and the sons," says he, "threw themselves into each other's arms. I saw them shed tears, and wishing to take advantage of a period which I conceived to be favourable, I stopped him at the moment when he stretched out his arms to me."

Coisson then opened the purport of his mission, imploring Toussaint to reflect upon the consequences that would inevitably result from any hostile measures against the power of Bonaparte. He also held out to him the most attractive promises of the glory that would await him by joining the French standard, and the vengeance that would doubtless accompany any act of hostility. He handed to the negro chief a letter, written by Bonaparte, teeming with kind expressions and admiration of Toussaint. But the latter was not then to be entrapped. The tutor then tried the intercession of his children and the entreaties of his wife. Bonaparte, in his letter to the chief, tries what effect an allusion to the former will have. "We have made known to your children, and to their preceptor," he says, "the sentiments by which we are animated. We send them back to you. Assist with your counsel, your influence, and your talents, the captain-general. What can you desire? The freedom of the blacks? You know that in all the countries we have been in, we have given it to the people who had it not. Do you desire consideration, honours, fortune? It is not after the services you have rendered, the services you can still render, *and with the personal estimation we have for you, that you ought to be more doubtful with respect to your consideration, your fortune, and the honours that await you.*" Toussaint having composed himself, and assumed an appearance of ease and confidence, took the preceptor by the hand; then directing the others to retire, he said with dignity, "Take back my children, since it must be so. I will be faithful to my brethren and to my God."

A truce was agreed upon for a few days, for the purpose of carrying on a correspondence between Le Clerc and Toussaint. Le Clerc anticipated a favourable result, but Toussaint's reply contained no augury of his submission to the will of the chief consul. The truce was ended, and each prepared for active operations. Toussaint and Christophe were proclaimed enemies of the French republic, and all persons were called upon to arrest them as outlaws.

Le Clerc, endeavouring to allure the negroes, held out assurances to their officers of rank and preferment in the French army, and the most solemn promise of freedom. The labourers and cultivators of the soil were becoming weary of war, and determined to remain neutral, so long as their properties were not mo-

lest. Le Clerc had nothing to apprehend from them, but to entrap or defeat the negro chiefs was most difficult, from the rugged defiles and passes of the country. The negro troops had been thoroughly instructed in skirmishing, bush fighting, and other irregular warfare. For such operations they were most admirably trained, disciplined, and equipped. They were quick in firing artillery, and good marksmen. Their movements were effected with rapidity: they flew from one point to another with the greatest celerity. Neither the scorching heat of the sun, nor the pernicious influence of the night air, had any injurious effects upon them, while the French were dying from the effects of both.

With the French the field duties were insupportable.

The French troops, however, in the plains of the north, attacked Plaisance. It surrendered, and the negro commander and his soldiers, consisting of five hundred infantry and cavalry, joined the French standard. Marmalade followed, and Christophe was obliged to retreat, in consequence of the treachery of one of his officers who had surrendered an important position on his line, and joined the French.

Near Port La Paix the French troops, under Humbert, sustained a check; and on the 20th of February the troops under General Debelle were obliged to retire, after having sustained some loss.

General Boudet landed at Port-au-Prince, and proceeded with his division against La Croix des Bouquets, which was occupied by the celebrated Dessalines. On the approach of the French force he set fire to the place, and the next day, by a most difficult yet rapid movement, crossed the mountains, and advanced to Leogane, which place he also set on fire, though defended by a French frigate. Dessalines would appear one day in the plains of the Cul de Sac, acting with determined bravery, and committing dreadful ravages before the French army, on the next, he would descend upon and devastate the plains of Leogane, but never facing the enemy in the open field. Bush fighting, and setting fire to the plantations, to impede the advance of the enemy and destroy their provisions was his usually successful plan of warfare.

La Plume, a negro chief, retreated before Generals Desfourneaux and Hardy from the vicinity of Plaisance, and surrendered, with all his troops, to General Boudet. This was a fatal blow to the negro cause.

On the 24th of February, General Rochambeau attacked Toussaint, who commanded about three thousand men, and had taken up a strong position in the Ravine à Couleuvre. The courage and skill of Toussaint and his troops were admirable: a sanguinary conflict ensued. Toussaint having left eight hundred of his men dead in the field, retreated to the banks of La Petite Rivière. Great military skill was displayed by the respective commanders in this battle. The slaughter was immense, and the loss of the French was estimated as greater

than that of the negroes. After the action Rochambeau could not advance, and Toussaint claimed the victory.

The French generals, by flattering promises, seduced Maurepas, a negro chief who commanded the district of St. Marc, to surrender with his force, consisting of two thousand men. This treachery was almost decisive.

Toussaint, Christophe, and Dessalines still held strong positions, and it required a considerable time and great sacrifice of life to dislodge them. Le Clerc trying every device to gain over the black troops, promoted many of those who had previously joined him, and by kindness towards others became so far exalted in negro estimation that they undertook to allure their brethren. In a short period Toussaint was left with few adherents. One reverse was followed up by another. Toussaint's fortitude never forsook him. He knew that the enemy would have to contend with greater obstacles than any which his resistance could present. Le Clerc, elated by success, became impatient to complete the great object of the expedition,—that of restoring the planters to their hereditary estates, of placing the negroes once more under their servitude, and binding the French government to resist all attempts to disturb the planters.

This impolitic attempt of Le Clerc excited general indignation. The planters, apprehensive of the destructive consequences of so rash a proceeding, declined to avail themselves of the offer.

The credulous cultivators, who had been allured by the promises of Le Clerc, began to consult their own safety, and to devise means to evade the orders of the French general.

Such of the negro troops as had joined the French began to feel terrified lest they should be forced back into slavery.

Toussaint seized the favourable moment, and with the most extraordinary celerity formed a junction with Christophe. The cultivators flocked to their standard; they moved on by forced marches with surprising rapidity, driving their enemy from one post to another, without meeting with the least opposition, until they appeared before Cape François.

Le Clerc, shut up in the besieged city of Cape François, and reduced to the greatest extremities, was saved by a strong reinforcement which arrived from France. But in the city, from the number of people within its walls, pestilential symptoms appeared, and the inhabitants and troops were prostrated by its ravages.

In this emergency, Le Clerc proclaimed "Liberty and equality to all the inhabitants of St. Domingo, without regard to colour," and an apology for his conduct, with an assurance that he desired nothing but to reconcile conflicting opinions, appease internal discord, restore peace, and place the colony in a prosperous condition.

All classes in Hayti are said to have concurred in one point, that resistance to the French was only justifiable, for the preservation of that liberty, which the national assembly of France had proclaimed.

Finally, to the prayers of the great body of the people Toussaint formally, yet reluctantly, assented. Dessalines was of opinion that no negotiations should be entered into with Le Clerc, except for the evacuation of the colony by the French forces. Both chiefs doubted the sincerity of the French general, and believed that his propositions were only intended to sacrifice them afterwards. Christophe, however, from discovering some symptoms of defection among his troops, opened a negotiation with Le Clerc, and officers were appointed for that purpose. Christophe demanded a general amnesty and the preservation of his own rank and property, as well as that of Toussaint and Dessalines, and of all the people of Hayti. To this Le Clerc unwillingly acceded, and the arrangements were accordingly concluded.

Toussaint and Dessalines, standing almost alone against the demands of the people, finally consented to the terms granted to Christophe for a short time. This agreement ending a contest, as cruel and sanguinary as any recorded in the annals of war. By this temporary peace the island of St. Domingo was admitted to be under the sovereignty of France.

The cultivators and proprietors returned to their homes, and recommenced their agricultural labours: hoping to remain in tranquillity, their families enjoying those comforts which the horrors of war had long denied them. Toussaint, Dessalines, and Christophe, retired to their respective plantations; being assured by Le Clerc, that their persons and property should be held sacred, and that instructions should be transmitted to them, upon which they were to act in their future military commands. Dessalines and Christophe were far from confident of either personal safety or of retaining their estates; nor did they slumber in their homes.
